# The AMATEUR PHOTOGRAPHER

Telephone No. 1645      Telegraphic Address: VINEY, LONDON

Offices: 1, Gress Lane, Ludgate Hill, London, E.C.

VOL. XIII. No. 326.]

FRIDAY, JANUARY 2, 1891.

[PRICE TWOPENCE.]

## OUR VIEWS.

"To hold as 'twere the mirror up to nature."—*Shakespeare.*

[Members of the Editing staff are "At Home" on Tuesday afternoons from Two till Five o'clock, and they will gladly give advice upon all photographic matters.]

YESTERDAY we entered upon a new year, and we heartily trust that it may prove a prosperous one to the readers of the AMATEUR PHOTOGRAPHER, who are now to be found in every part of the inhabited world. It is possibly a hackneyed use of a good song, still we cannot refrain from quoting two lines from Tennyson's "In Memoriam"—

"Ring out the old, ring in the new,  
Ring out the false, ring in the true."

There is much that is false in photography, false to nature, and false to art. We shall, in the coming year, do our best to eradicate this falseness by devoting considerable space to the publication of articles upon the language, rules, and teachings of art in its application to photography. For this purpose it is proposed to take as examples the work of past masters in drawing and painting, and as far as possible to make reference to pictures which are known to many of us, and are accessible to all, as, if our readers cannot examine the originals, at least excellent copies or engravings of most of those that will be referred to are within their reach.

This week we publish the first of a series of articles upon "Composition, Light and Shade," by Mr. H. P. Robinson. These articles are based upon "Burnet's Essays," and we shall reproduce a great many of the examples given, so that our readers will have a practical guide, certainly, to the different forms of composition. Next week we shall commence a series by the Rev. F. C. Lambert, M.A., "Studies in Art for Photographers," in which they will be instructed in "art language" for the expression of thought and as a teacher of the grammar, method, and application of art principles to photography. This series will be illustrated with reproductions of paintings by artists of renown who have won their laurels, and whose works are an ever-living testimony to their love of the beautiful.

In practical photography Mr. C. H. Bothamley, F.I.C., F.C.S., will continue "Photographic Chemistry;" Major J. F. Nott, "Photographic References;" Mr. C. J. Leaper, F.C.S., commences a series on the "Construction of Lenses, and their Uses;" Mr. Andrew Pringle will deal with "Photo-Micrography." The Rev. T. Perkins, M.A., writes a short set of articles on "Photographic Work for the Winter Months;" Mr. Valentine Blanchard will conclude his series of admirable articles upon "Stereoscopic Work,"

and Mr. W. Jerome Harrison, F.G.S., will continue the chapters upon "Instantaneous Photography."

The foregoing will, we think, satisfy our readers that we intend keeping up the literary standard of the AMATEUR PHOTOGRAPHER.

The general news will be kept close up to date, and, notwithstanding all new bidders for public favour, keep first. We start a new column, "Notes for Novices," a "Lantern Slide Exchange Column," on identical lines to the Sale and Exchange Column, except that all entries are free; all we ask our readers to do, is to make their announcements as short as possible; one insertion only will be allowed for each announcement.

Arrangements have been made with a band of workers to answer "Queries" in the next issue to that in which the questions are asked, so that any question appearing this week will be answered next week. Another important addition to the work to be done in the editorial department is testing and reporting upon photographic apparatus, etc.\*

- (1) Testing and reporting on lenses.
- (2) Testing and reporting on plates and bromide paper.
- (3) Testing exposed plates.
- (4) Testing shutters.
- (5) Testing coloured glasses and media for lanterns and dark-room windows.
- (6) Reporting on apparatus bought through the "Sale and Exchange Column."

We shall give a full report in every case, and will, on application, furnish further particulars as to the work covered by the tests, etc. All communications must be endorsed "Testing Department."

The scheme for the year's AMATEUR PHOTOGRAPHER Competitions is definitely settled, the dates given below are those upon which the competitors' work must be actually received, i.e.:—

"AMATEUR PHOTOGRAPHER" COMPETITIONS, 1891.

Jan. 22.—Monthly Lantern Slide (Landscape and Seascapes).

31.—"Seven Ages of Man."

Feb. 2.—Monthly Photographic (Animals and Instantaneous Subjects)

19.—Monthly Lantern Slide (Portraiture and Figure).

\* In the case of Nos. 1, 2, 3, and 5, a uniform fee of 2s. 6d. will be charged for each report. No. 4, 5s.; No. 6, a minimum fee of 2s. 6d., or 2½ per cent. upon the sale price of the apparatus.

- March 2.—Monthly Photographic (Snow and Hoar Frost).  
 „ 19.—Monthly Lantern Slide (Animals and Instantaneous).  
 April 2.—Monthly Photographic (Inland Scenery).  
 „ 16.—Monthly Lantern Slide (Architecture—Interior and Exterior).  
 May 2.—Monthly Photographic (Hayfield).  
 June 1.—Monthly Photographic (Village Life, Farming, etc.).  
 „ 17.—Public Schools (particulars to be announced).  
 „ 30.—\*Photography at Home (particulars to be announced).  
 July 1.—Monthly Photographic (Out-of-door Figure Subjects, Groups, etc.).  
 Aug. 1.—Monthly Photographic (River Scenery).  
 „ 22.—\*Ladies' Photographic (particulars to be announced).  
 Sept. 2.—Monthly Photographic (Harvesting).  
 „ 24.—Monthly Lantern Slide (Landscape and Seascape).  
 „ 30.—\*Annual Lantern Slide Competition (particulars to be announced).  
 Oct. 1.—Monthly Photographic (Enlargements).  
 „ 8.—\*Public Schools (particulars to be announced).  
 „ 22.—Monthly Lantern Slide (Portraiture and Figure Studies).  
 „ 30.—\*Annual Stereoscopic Slide (particulars to be announced).  
 Nov. 2.—Monthly Photographic (Inland Scenery).  
 „ 19.—Monthly Lantern Slide (Animals and Instantaneous).  
 Dec. 1.—Monthly Photographic (Seascape and River Scenery).  
 „ 17.—Monthly Lantern Slide (Figure Studies and Humorous Pictures).  
 „ 31.—\*Holidays with the Camera (particulars to be announced).

All prizes will be in the form of medals from the AMATEUR PHOTOGRAPHER's several dies. No prize winner will be allowed to compete again for a medal of the same value as that awarded him. The AMATEUR PHOTOGRAPHER Monthly Competitions are for the encouragement of beginners and those who have never entered a competition or exhibited their work. In the competitions marked with an asterisk, special or "progressive" medals will be offered for competition by past prize winners.

The "Public Schools" Competition is quite a new feature in our programme, and has been determined upon owing to the fact that, in connection with almost all our large public schools, photographic societies have been formed. In connection with this competition we hope to enlist the sympathies of masters as well as pupils; of course, the competitions will be open only to the latter. The success of the first "Ladies' Photographic Competition" prompts us to announce another to be held this year.

We hope within a month to have all the entry forms prepared, and applications for them will receive attention.

Monthly competition photographs and lantern slides will be loaned to photographic societies and others, every application to be accompanied by a *packing fee of one shilling*.

—•••••

In the above we have very briefly sketched out our programme for the year of grace 1891, and will refer to the work done in connection with the advancement of photography in general, and by ourselves in particular, during the year just ended.

—•••••

NOTHING very startling has been done in connection with the practice of photography during 1890. The transparent rollable film of the Eastman Company has been brought to a state of great perfection, and the vast improvement in the

"Kodak," especially those of a larger size, augurs well for the very general use of the film in the coming year. Other films are in the market, but they are of cut sizes, and the greatest difficulty to their more general use is the want of a good and simple changing box. The one invented by Mr. E. Ferrero has, we believe, had a large sale, but the necessity of using a sleeve militates against its general adoption. It is a want, and doubtless prominence in these pages will set some inventive mind to work, and we shall soon have an automatic arrangement for changing films.

Eikonogen has entered the lists against hydroquinone as a developer, and many who strongly upheld the latter are strong in their praises of the former. Others use what they are pleased to call "hydro-cum-eikon."

Instantaneous work is still practised extensively, and Mr. Louis Meldon has given us another picture which runs his "Diver" very close, "A Cycle Race," taken in "1/100 of a second on a Paget xxxxx plate." Hand-camera work has been the hobby of many during 1890, and there is every probability that this year will see even more work of this kind done. The use of small cameras has given an impetus to enlarging, and there are few amateurs who are working hand-cameras or quarter-plate cameras who do not possess an enlarging lantern, or who have not rigged up a home-made enlarging apparatus. The newest form of lantern is that patented by Mr. Shenstone, of Colchester. Those who have used it are delighted with the simplicity and ease with which it is worked.

Lantern slide work is exceedingly popular, both for purposes of amusement and as an educator. In connection with the former it has been our privilege, through the liberality of our readers, to "loan" hundreds of slides, which have gladdened the heart of many to whom a landscape in all the loveliness of nature is unknown. As an educator, Mr. C. H. Bothamley's article, contributed to the *Photographic Quarterly*, has set thoughtful men thinking, and a "Magic Lantern Mission" is one of the outcomes. Professor Miall, of the Yorkshire College, Leeds, has been the pioneer of the use of the lantern in daylight, with the result that expensive diagrams are practically unknown in the college. The illustrations in a text-book are copied in the camera, and lantern slides made of them. These are properly titled, indexed, and kept in a cabinet for reference, so that the Professor has only, as he is giving his lecture to the students, to turn up the slides needed to illustrate his remarks, and in a corner of the lecture hall, where the daylight is screened off, they are projected on to a screen, or, as Paddy would say, on to a white blackboard, and are in full view of, perhaps, some 200 or more students.

For ourselves, we find the making of lantern slides to have become so general that we are starting monthly competitions during the first four and last four months of the year.

The contributed articles in the AMATEUR PHOTOGRAPHER have been maintained at a high standard, the best writers being secured, and the most popular subjects treated. The correspondence columns have contained letters upon matters of general interest, and the news of the photographic world always given first-hand and well up to date.

Photographic exhibitions have not been so numerous in the latter part of the year. There were several in the first four months, notably, Keighley, Royton, Hastings, Kidderminster, Belfast, etc. The Crystal Palace Company held a good photographic exhibition in March, but it did not receive the support at the hands of the trade that it certainly deserved. Consequently, we understand it is not intended to hold an exhibition at Sydenham this year. Under the

auspices of the photographic section of the Chamber of Commerce, an exhibition was held in the Drapers' Hall, which was strictly limited to photographic dealers and the work of professional photographers. It was, we believe, largely attended; the apparatus and pictures exhibited made a grand show in the beautiful hall of the Drapers' Company. In the latter part of the year we have had exhibitions at Manchester, Wolverhampton, Edinburgh, and, of course, Pall Mall.

The Photographic Society of Great Britain have gone into new quarters, and with their removal from 5A, Pall Mall East, the much-respected Assistant Secretary, Mr. Edwin Cocking, severs his connection with the Society after a long and faithful service. The Society's rooms are at 50, Great Russell Street, and more accommodation is there afforded than the Society has ever before possessed. The photographs sent to the Exhibition have been discussed at considerable length in these columns. The new school, or schools, nearly cleared off all the medals—why, to many, remains one of those never to be cleared up mysteries. The chief claim that we can find advanced is that they resemble "sepia drawings." Some go farther, and say strong things about them; but this is a time of "peace and goodwill," so we will forbear, and not say unpleasant things. If anyone wishes to have what in our mind is the best criticism upon the Pall Mall Exhibition, let him read the paper contributed by Mr. P. H. Newman to the West Kent Amateur Photographic Society, and published in our issue of the 19th ult.

We must now refer to the scheme for the establishment of a Photographic Institute, and claim that, whatever form it may ultimately take, it will owe its origin, as do many of the forward steps made in photography during the last five years, to the correspondence columns and articles that have appeared in the columns of the AMATEUR PHOTOGRAPHER. We are delighted to find that the labour and thought we expended on the subject during last winter has been taken up by some of our leading men. The Photographic Institute must be formed by united effort; and those who read the January number of the *Photographic Quarterly* will find that one means by which it is hoped the scheme may be helped is the holding in 1892 of an International Photographic Exhibition at Earl's Court, on the same gigantic scale as the Inventions, Colonial, and Fisheries, the profits from which are to be set aside for the Photographic Institute. The article is most ably written by Major J. F. Nott, who, in conjunction with Mr. Alfred Maskell, is working with a small but strong Committee, and making the preliminary arrangements in regard to the Photographic Exhibition, 1892.

We are very pleased to make known in a few words such a grand proof of the advancement in photography which is evidenced by the fact that such an exhibition is in contemplation. We wish those gentlemen every success, and we have little doubt that they will carry out their proposals, notwithstanding the enormous amount of work before them.

This month sees the Camera Club housed in their new premises. We know of no art or dilettante club that will have a better house than the members of the Camera Club. A member said to us only to-day, "It will be a nice club," meaning that, although a photographic club, it will have the comforts and luxuries of a first-class social club. We are not prone to "run" even the Camera Club. These columns did that to repletion in the early days, but we do strongly advise those who intend to join to take advantage of the concessions made to the first hundred members to be elected in this year. See "Our Views" last week.

The Club have done some good work in connection with their

Conference, and also the One-Man Exhibitions that have been held. The "Thursday Evenings" in the new rooms will be very popular. Latterly, the rooms in Bedford Street have been dreadfully crowded, and many have been obliged to stay away, but now there will be ample accommodation, and, we feel sure, large attendances.

The Photographic Convention had a fairly successful meeting at Chester, under the admirable presidency of Mr. C. H. Bothamley. This year the members will visit Bath. Mr. Bedford, jun., has been elected President. It may surprise some to learn that Mr. Andrew Pringle, the father of the Convention, first brought the matter under the notice of the photographic world in the AMATEUR PHOTOGRAPHER, in a letter addressed to us and published in our issue of the 22nd January, 1886, headed "Congress for Amateur Photographers, etc."

Of the now nearly 200 photographic societies formed we can only say that they are all doing good work. So many have been started during the year past that it is practically impossible here to enumerate them. They find us ready to help them in every possible way, perhaps more through the medium of the *Photographic Reporter* than in these pages. The references we are able to give here are, of necessity, very brief, owing to the many and ever increasing calls upon our space.

The books on photography that have been published in the year are not numerous. We would note the following:—"Casket of Photographic Gems" (Ingles Rogers); "Photographic Reproduction of Drawings" (Waterhouse); "Amateur's First Hand-Book of Photography" (Ellerbeek); "Photogravure" (Wilkinson); "Stereoscopic Manual" (Chadwick); "Modern Photography for Amateurs" (Eaton Fearn); "Photo-engraving, Photo-litho, and Collotype" (Wilkinson); "Burton's Modern Photography"; "Photography for Amateurs" (Hepworth); "Lantern Slides, and How to Make Them" (Dresser). Our publishers, Messrs. Hazell, Watson and Viney, Ltd., have done something to swell the list, i.e.:—"Prize Pictures" No. I., reproductions of photographs by Alex. Keighley; "Prize Pictures" No. II., Paul Lange's Norway; "Holiday Work," "Home Portraiture," "Names we Love, and Places we Know," "Book of the Lantern" (third edition); "Dictionary of Photography" (second edition); "Art Photography," "Platinum Toning," "Experimental Photography," "Art of Retouching," "A Tourist's Equipment," etc., etc.

The *Photographic Quarterly* stands high in the estimation of all interested in photography. The articles are contributed by men of high culture, and we make the statement with considerable pride that it ranks as the first photographic publication published in the United Kingdom. We see no difficulty in keeping up the high standard of the contributions. The sensation of the year in connection with it has been the chromo-collotype published in July last.

The *Photographic Reporter* has filled a gap in photographic literature, and has a large circulation. We believe our effort to issue the *best* monthly illustrated magazine is appreciated.

The AMATEUR PHOTOGRAPHER Annual for 1891 will be ready for publication early in February. It will be published at one shilling, and is upon distinctly new lines.

We have wandered on far beyond our intention, and must close these rambling comments upon the work of the future, and the past. The one lies all before us, and the other nothing can recall. In some matters discussed in these columns we have been injudicious, and admitted, perhaps endorsed, opinions that it were better had never

been expressed. If such has been the case, we beg to offer our sincere regret. Whatever has been inserted in these pages has been, as we at the time thought, for the benefit of photography, and certainly for the benefit of our thousands of readers who practise photography not as a means of livelihood, but as a pastime which helps them to view nature in all her loveliness, and to seek out upon the face of our beautiful Mother Earth fresh spots to endear her to us.

—♦♦♦—

THE members of the West London Photographic Society are going to hold a conversazione in the Lecture Hall, Hammersmith Broadway, on the 9th and 10th inst., on which occasion there will also be an examination of members' work. In the examination there is to be no classification of pictures, and there is no limitation as to size or subject. We note, however, that no picture which has been previously exhibited or taken a prize will be eligible for competition.

—♦♦♦—

WE regret to announce a sad trouble that has befallen Mr. J. Traill Taylor, Editor of the *British Journal of Photography*, in the loss of his wife, who died on the 23rd ult., from pneumonia, after only two days' illness. Many of our readers will join us in offering Mr. Taylor very sincere sympathy.

—♦♦♦—

IN another column we publish a letter upon the forthcoming Photographic Exhibition to be held in Vienna. We have felt it our duty to insert the letter, which is from a gentleman of good standing and a most accomplished photographer. If the statements made prove to be correct, especially in regard to the conditions under which photographs are allowed to be entered as the work of the exhibitor, we can give no further support to the exhibition, and feel sure that our best amateur workers will not send out their own work to be entered in competition with photographs that have been worked by professional photographers. We have been led to believe that the Vienna Exhibition was to be the exhibition *par excellence*, and to lead and guide future exhibitions in this country. Our columns are, of course, open to reply; in the meantime we should advise intending competitors to hold their hand, before sending photographs to Vienna.

—♦♦♦—

ANNOUNCEMENTS in the "Lantern Slide Exchange Column" should take the following form:—

"Will exchange four slides, Thames views, for four taken on the beach at Hastings. Brown, 4, Pickle Street, Capsicum."

The column will be found most useful in making up sets and also in illustrating holiday tours. All announcements must be received before Tuesday morning.

—♦♦♦—

THE list of competitors in "Holidays with the Camera" will be published next week.

—♦♦♦—

IN another column we publish the awards made by the judges upon the photographs, etc., exhibited at the Edinburgh Photographic Exhibition. It will be noted that a large proportion of the medals go to Scotch workers; this was to be expected, as the photographers south of the Tweed have not supported the Exhibition as they might have done. We congratulate the judges on their award, and can sympathise with them in the enormous amount of work they had

to get through, especially as the hanging has been arranged rather to secure artistic effect than to assist the judges in their very arduous duties.

—♦♦♦—

A CORRESPONDENT from St. John's, New Brunswick, writes: "I suppose your competitions are open to subscribers out of England?" Certainly they are. We have by the same post received an application from Lagos, West Africa, for entry forms; the writer adds: "I have been taking your paper for some time, and find it simply invaluable, the 'Queries and Answers' columns very often just suiting my own case; and as I do a good deal of instantaneous work, using a No. 5 Kodak, the articles on 'Instantaneous Photography' possess a particular interest."

As the programme for the year's competitions has been arranged, we have no doubt we shall have a great many more entries from abroad, especially from India, the English colonies, and the United States.

—♦♦♦—

### ECONOMICAL DEVELOPING DISHES.

THE well-to-do amateur is notoriously unsparing in his outlay so long as the money spent makes his hobby hurry more swiftly in pursuit of success. Unfortunately, there is a large majority of individuals who have to keep their expenditure on photographic apparatus, etc., within very narrow limits; to these, and also to the rigid economists, the following hints upon developing dishes are addressed. It is also to be remembered that there are many men of means who, living in out-of-the-way parts of England, or still more outlandish regions in the four quarters of the globe, are often puzzled to know what to do in the absence of porcelain or vulcanite dishes.

In the remarks which follow, dishes over half-plate are generally referred to. Perhaps the most sweetly simple form of dish is that which is made by utilising the print itself. In order to do this, the paper after printing is folded about three-quarters of an inch from each edge (see fig. 1), the dotted lines showing where the folding is effected. The four sides being bent at right angles to the centre portion of the paper, we get a tray as shown in fig. 2; the corners, as A, being held together by any simple form of metal or wooden clip, which can be readily made and easily fixed, and needs no further description. As a rule, this form of tray is only suitable where the paper used has considerable substance, *e.g.*, Eastman's thick paper (C) would answer in cases where the thin (A) would fail. Again, the power of the paper to resist the tendency of the bath to percolate must be taken into consideration.

The percolating force which a liquid will exert on the pores of the paper is directly as its depth, and is not affected by its surface area; neither will the pressure on the side be affected by the superficial area; but the side itself is weaker to resist any pressure in proportion to its length. From these it is apparent that where a thin layer of fluid, whether developing, clearing, or fixing solution, is to be used, there is little or no fear of any percolation where ordinary care is employed; more especially is this so inasmuch as most of the papers amateurs work with are practically waterproof—for instance, bromide paper—but some, such as the ferro-prussiate blue paper would probably not hold water for any length of time.

In using the print as its own dish it is necessary to employ a piece of wood having a flat even surface, or some other convenient support, measuring slightly larger than the improvised dish; by means of this the print may be rocked and the solution poured off.

Objection has been taken to the above method of

doing without a dish for the following reasons:—(1) It is not economical, as a larger piece of paper than is otherwise necessary has to be used; (2) it is too troublesome and risky. As regards (1), the paper need not measure more than one inch and a half each way in excess of the normal size. Where the print is larger than the amateur usually works, and only one or two impressions are needed, it is cheaper and more convenient to waste a small strip of paper than to buy two or three huge dishes; it is to be remembered that what is lost in paper may often be saved in the smaller amount of developer needed. In any case, for experimental purposes, or where time is an object, the foregoing device is of undoubted value. Respecting objection (2), nothing is to be said, except that we live in an age of manipulative decrepitude. "In the brave days of old," *consulé Planco*, or, in plain English, when Albert was Consort, photographers were made of sterner stuff. Picture an old-fashioned wet collodionist talking of the trouble and risk involved in the use of the above adaptation! Those who are naturally nervous or

FIG. 1.

clumsy may to a large extent insure themselves against failure by fastening in advance strips of wood to the support in such a manner and of such width that they hold in position the paper sides of the extemporised tray. Indeed, in all cases where the print is of extra large size, or where it has to be treated with a number of solutions or with a single bulky solution, the above means should be resorted to.

A further evolution of the above contrivance is the employment of a convenient water-proofed material out of

FIG. 2.

which to construct a dish; perhaps the most desirable substance being the Willesden waterproof paper. This is folded exactly as shown in figs. 1 and 2, but the sides should be made a little deeper. Willesden paper can be bought of various thicknesses and in small lengths. The writer has for several years used trays made of this material for developing negatives (pyro) and bromide paper (ferrous oxalate, acetic acid, and hydroquinone) without detecting any injurious action due to the material on negative, print, or developer; the same remark applies to fixing bath (hypo). Large-sized trays require the support of a piece of wood in order that they may be safely lifted.

The folding trays manufactured by Messrs. Tylar are made on the above system, and can safely be recommended for travelling or occasional use.

### A YOUNG PHOTOGRAPHER.

THE following is a short account sent us by Mr. S. Stamp, of Stockton-on-Tees, of how the photograph we reproduce was secured:—"I had the youngsters in the garden, taking their photographs. The little lad seemed to take particular notice of all I did, although he asked no questions; but the next morning he brought me his empty toy box and a tin lid, asking me to fasten the tin lid on to the box. He then carried it into the yard, took

dollie, stools, and his little sister. Having posed them, he hunted up a cloth to focus with, and then, without having asked advice or help, he set to work to take their photographs. Seeing what he was after, I got my camera, and took a drop-shutter photograph. The sitter is aged  $2\frac{1}{2}$ , and the operator  $3\frac{1}{2}$  years. My wife says she is afraid that he is going to be a chip of the old block."

**The Camera in Greenland.**—The best book of travel which we have read for a long time is Dr. Nansen's "First Crossing of Greenland," published by Messrs. Longmans, in two bulky volumes. The intrepid young Norwegian writes (vol. i, p. 69), "A necessary addition to the outfit of a modern exploring party is, of course, a photographic apparatus. I took a little camera with me to use with the theodolite stand, two roll-holders for stripping films, and ten rolls of twenty-four exposures each. The camera alone weighed two and a quarter pounds. I made about 150 exposures, and on the whole was well satisfied with the apparatus and the results. Glass plates would, of course, have been much too heavy and inconvenient. I also had two red lamps, one of glass and the other of paper, for changing the rolls, and a few stearine candles to use in them." The illustrations in the book are mostly drawn from photographs. Dr. Nansen is to lead an expedition to the North Pole in 1892, when he expects to have an experience of at least two years in taking snow pictures.

**Photography in Natural Colours at last!** or, at least, lantern slides in natural colours, have been actually obtained, if we are to believe an article by Mr. A. W. Scott in one of the "Annals." Unfortunately, so little is said that one is left delightfully in the dark, and the only ray of comfort is that slides with the natural colours will be shortly shown in London. Mr. Scott has invented a special camera, the "Verak," which presumably does the trick, as Mr. Scott has obtained "bill-posters' hoardings ablaze with coloured bills, flower gardens, private houses, shops with coloured wares exposed for sale, fields and distant hills, buildings, and sky effects. Exposures varied from 2 to 12 secs. in sunlight." Now, all this important discovery was made in a chapel, when the sermon could not be heard; and a peculiarity in the pulpit and a fortnight's study of the solar spectrum gave Mr. Scott the key to success. He had found out the nature of the primary colours, thrown over all previous ideas, formed a new theory (!), and lo! photography in natural colours was *un fait accompli*. If you, dear reader, know of a chapel where the sermon cannot be heard, and with "a peculiarity in the pulpit," by all means go there, and find out photography in natural colours.

## Negatives and Positives.

AUNT BELINDA was returning home the other evening, after having taken part in a convivial meeting of the "Society for the suppression of *back sliders*," and by chance stepped unwarily upon the track of some of the unsuppressed. The result was, as she expresses it, that she "sat down before she did sit down," and now she says she quite understands the meaning of a *dark slide*.

At a "free and easy" meeting of the "Bell Botelle Artists," otherwise known as the society of "cork drawers," various guesses were made as to the true interpretation of the familiar letters "A. P." 'Arry 'Awkins says it stands for the 'appy party who reads that popular Journal. Other suggestions were, "always polite," "artistic and practical," etc. The winner wisely waited till everyone had outvied each other, and said the true interpretation includes them "all and particular." Thus it may be seen that the noble society of cork extractors and delineators are wise in their generation. (P.S.—The wag of the society says his artistic talent lies chiefly in drawing his salary. The cynical one says that none of the other fellows ever draw anything except the long-bow).

THE usual annual and jovial invitations have gone forth. "Mr. Sol presents his compliments to Ho. Sophos, Esq.,"\* and desires his company to assist in partaking of a repast, of which the accompanying menu may be taken as provisional:—

MENU.  
 POTAGES.  
 Consommé de Longfocus.  
 Pôtage à l'Achromatique.  
 POISSONS.  
 Filets de Collodion (frites).  
 St. Maddox au Gratin en Gélatine.  
 ENTREES.  
 Côtelettes à la Tombé-drop.  
 Croquettes de Blinde-roulé.  
 RELEVES.  
 Poulets, Sauce de Quinol.  
 Langue à l'Oxalate.  
 Bœuf à l'Anglaise, Sauce de Pyro.  
 ROTS.  
 Faisans aux Hypo-Soude.  
 RELEVES DE ROTS.  
 Mayonnaise du papier-albumine.  
 Aspics de Platinotypique.  
 ENTREMETS.  
 Pouding Stickphaste.  
 Gelée de Starch.  
 FROMAGE-CARTON.  
 Teinte d'Inde. Marque de Plat.  
 DESSERT.  
 Médailles d'Honneur.

We may say that we know Mr. Sol to be a "good old so(u)l," and are sorry that (smoky) circumstances, over which we have no control, prevent our seeing as much of him as we could wish. Anyone who is fortunate enough to receive an invitation will be hard to please if he fails to find the above programme insufficient for him.

\* In case anyone receives this invitation and does not recognise his own name when spelled in that way, we may explain that it is Mr. Sol's polite way of expressing "The wise one who reads the A. P."

SAM WELLER has explained to us some of the mysteries of love-letter writing. Possibly at this festive season some of our photographic friends are desirous of addressing the object of their devotions, and are at a loss as to how best to express their sentiment in forcible and picturesque language. The accompanying letter has been placed at our disposal, by the writer, as a thank-offering for having produced the much-desired reply:—

DEAREST MISS . . . —The image of yourself has been *focussed*, with the *smallest diaphragm*, on the screen of my affections for so long, that I venture to ask you to share my humble lot. My outfit at present consists of *three gross* a year, together with a freehold camera residence, *long-focus garden*, brass-bound furniture, with every possible movement. I therefore venture to hope that you will consent ere long to *develop* and *fix* your image by my side, that my hitherto solitary *plate-holder* may be replaced by a conjugal *roller slide*. My *intensified* admiration of your many qualities of *brilliance*, *sparkle*, and *pluck* ought not, I am sure, to remain as a *latent image*, but be *transferred* to the *support* of my *rapid symmetrical* regard. There only now remains your consent to unite us in a *brilliant combination print*, free from *blisters*, *astigmatism*, or *diffusion* of interest.

I can only regret that the *refraction* of my words fails to convey to you the *ortho-chromatic iridescence* of my daily *intensified* admiration, and therefore hope you will favourably regard them with the *lens* of good-will, free from *chromatic aberration*, *dispersion*, or *distortion*.—I remain your very affectionate and *achromatic* . . .

REPLY.

DEAREST MR. . . . —The *warmth of tone* of your note I estimate in its true *values* and *breadth of sentiment*. I can only, therefore, reply, "Take me—for better or for worse—*Negative or Positive*."—Yours . . .

SEQUEL.

On the . . . st, at St. Daguerre's . . . to . . . by the *instantaneous process*. [No *cartes-de-visite*.]

**Daguerre Tomb Restoration Fund.**—We have to acknowledge the receipt of 12s., collected at the last ordinary meeting of the members of the Lewisham High Road Camera Club. The Secretary kindly says another collection will take place at a more crowded meeting. We hope other societies will help us, especially when the 1890 "Prize Slides" are shown.

**Consumption and Photography.**—It seems inevitable that when one man makes a brilliant scientific discovery someone is sure to claim to have made exactly the same discovery years ago, and this is well seen in the case of Koch's consumption cure, as one of our transatlantic cousins claims to have used exactly the same method of cure fifteen or twenty years ago; unfortunately, however, for this pretender's claim, he can adduce no further evidence than his bare word. However, this is not what we intended to note, but in the *Photographic Times* of New York, for November 28th, appears a letter, over the signature of C. L. Lochman, asking for information from old daguerreotypists as to the curative properties of bromide and iodide of mercury in the incipient stages of consumption, his experience leading him to believe such mercury compounds have some such curative action. In the issue of December 12th of the same paper, "an old daguerreotypist" states that in 1859 a young man who showed all the symptoms of incipient consumption apprenticed himself to a New York daguerreotypist, and that after three months' work his health visibly improved, and that he is now a "hale and hearty old man." It is stated also that names and facts in this and two other cases can be given. It is by no means improbable that the inhalation of nascent bromide and iodide of mercury might prove useful in cases of lung trouble, as mercuric chloride in the form of solution has long been recognised as one of the most powerful of all germicides. Unfortunately, however, any mercurial cure is attended by some inconveniences, which will not be without effect in its adoption or rejection, as workers with mercury, such as mirror-makers, who inhale mercury in a state of vapour, soon lose their teeth, and such minor appendages as their hair. Another rival to Koch has appeared, as Dr. Petit presented to the Society of Practical Medicine some lymph identical in appearance, and, it is also stated, in action on tuberculous animals to the original. This, if true, is fortunate, as Koch has failed to manufacture his lymph in small quantities, and his own stock is also destroyed.

## Letters to the Editor.

### PHOTOGRAPHIC ART TENDENCIES.

SIR,—May I be allowed a little space in your next issue to raise a voice from the humble obscurity of "amateurism" in words of grateful thanks to Mr. Philip H. Newman for his splendid lecture before the West Kent Amateur Photographic Society, and published in your number of December 19th, 1890, a lecture from which a decalogue of axioms might be culled, which ought to be printed in letters of gold and hung up in the meeting rooms of every photographic society in the kingdom; a lecture, almost every word of which sinks into one's soul with a feeling of restful satisfaction that the "whole duty of the photographer" should be made so plain, and which—if anything can—ought to snuff out the false lights of the "naturalistic" school, now so long flaming in the sight of photographers of all grades; a lecture which for terseness, simplicity, and convincing argument we have not seen in print before, and which carries its convictions home over the tide of squabble and recrimination which have preceded it.

There are, however, one or two points which, if I may be allowed, I would like to put before Mr. Newman in another light, that of a practical worker of over thirty years' standing, and which—as he starts on the assumption of "not being a photographer, scarcely an amateur, and very much an outsider"—may not have occurred to him before.

(1) Printing Process. Mr. Newman considers that a fresh process of printing has yet to be invented which will perfectly supply the place of silver chloride in albumen in rendering the extreme beauty of range of tone undoubtedly possessed by our very old friend and ally, silver chloride. True it is that neither bromide nor platinotype papers do so, but has he ever seen and studied fine specimens of printing in "Autotype carbon" from good negatives taken *direct from nature* (not from pictures) with lenses by the best opticians, and with every care given to the production of good definition—not necessarily microscopic—such as he appears to admire most? If not, let him do so, and I feel sure he will be satisfied that all is to be found there that the artistic sense need wish for. I can assure him that I do not know any existing process—not even silver chloride in albumen—which can produce more delicate gradation of tone or such all-round artistic results. I am comparatively a novice at the process, having only worked at it for about six months, but the beauty of the results has astonished me. The gradation of tone, purity of colour, and *transparency of the shadow detail* are excellent, and after testing by duplicate prints from the same negatives, I am convinced that there is nothing to touch it when carefully worked.

Loss of transparency in shadow detail is not necessarily co-existent with a "matt" surface. It is so with platinotype and bromide work, but not with carbon.

The surface texture of carbon prints depends entirely on the surface of the "temporary support" which holds the "tissue" during development by "double transfer." If made on the ordinary "flexible support" supplied by the Autotype Company, the finished picture has a surface closely approaching that of moderately albumenised paper. If made on polished plate-glass coated with collodion, it possesses all the offensive glaze of "Aristotype" paper or of "enamelled" prints; but if made on the "smoothed" surface of opal glass, the print possesses a "matt" surface of great delicacy and purity, as soft and yet more beautiful than either platinotype or bromide, and yet with the peculiarity that the shadows are transparent and full of "atmosphere," which the other processes named cannot be said to possess; and the beauty of the process is enhanced by the fact that whilst platinotype prints demand a negative of a certain vigorous character to obtain the best result, carbon will properly represent the effect of *any style* of negative, but is seen at its best when the negative is full of soft definition combined with a proper gradation of contrast, which should not be too strong.

The only drawback to the "Autotype" process at present is the limited range of tints available to select from, as there is no "toning" or variation of tint possible during the process of printing. The tints produced by the Company (which can be constantly and readily obtained commercially) are all imitations of various silver processes and of platinotype, which being in such general demand appear to have set the fashion, and, of

course, their commercial productions are ruled by the demand. The range of tints are "engraving black" and "warm black" (both can be used as substitutes for platinotype); "standard brown" (imitation of a brown-toned silver print); "sepia" (so-called), a still redder variety, but it is not true sepia in shade, and is an almost exact match for "Vandyke brown" in water colour, which I think all artists will agree is not a pleasant tint for general landscape work, being too hot in tone. What is much wanted to place carbon landscape work on its best footing is a tint of *true sepia*—a tissue somewhere between the existing tints, especially as the popular taste seems more to incline to such a shade as compared with the tones of pure black shown by platinotype and bromide pictures. The "red chalk" and "moon-light blue" tissues are suitable only for special subjects.

(2) Negative processes. Mr. Newman states, "When I look back to the old collodion days, etc., it is a matter of surprise and great dissatisfaction that present facilities of operation have not allowed a much greater advance artistically than I find." I suppose I may be looked upon as a heretic or an old fogey behind the times when I assert as my deliberate opinion that the best gelatino-bromide plates in the market under the most approved state of development cannot "hold a candle" to a well conducted wet collodion process, as far as the special point of *artistic quality of result only* is concerned. It is not contained in gelatine as a *vehicle* to approach collodion in purity of texture and transparency, richness of deposit of metallic silver, and in roundness and gradation of definition. I worked at wet collodion on 12 by 10 plates for fifteen years prior to 1870, and I have prints (now twenty-five years old) from those negatives which prove to my great dissatisfaction that I have never been able to equal them since by any efforts with gelatine plates, and I do not expect that I ever shall. Greater sharpness is obtainable with gelatine, and the advantages of speed of exposure and the conveniences for use and transport are untold, but there was always this was one special point of advantage about wet-plate work, that you knew what you had secured in the way of pictorial result before you left the spot.

I have never yet taken a negative with which I have been so perfectly satisfied that I could say I could not improve upon it if I tried again, and there is just the crux where the excellence in pictorial result may be attributed to collodion, apart from the intrinsic merit of the silver image itself, if you did not think the plate quite up to the ideal standard you could always take another with very slight cost or trouble, and so correct your failings in the first in either composition, exposure, or manipulation, and this cannot be done with gelatine plates, because you cannot know your results until you get far from the spot, which may never be revisited; hence hundreds of plates prove just a little short of that best picturesque result one could have desired, if only they could be taken again under similar conditions. I go so far on this subject as to say that if I were a professional photographer whose status depended on the artistic quality of my landscape photographs, I would go back to wet collodion with all its drawbacks and impediments, and I rather fancy that if the opinion of such old "experts" as Mr. Bedford, sen., and Mr. G. W. Wilson, and others of their day were asked, they would agree with me on the "artistic quality" point of the matter, though not as to business convenience.

I therefore argue that the excellence of artistic result is not dependent on the modern dry plate, except so far as speed of exposure under certain circumstances, and convenience of transit are concerned—very much the reverse—and I should be pleased to give Mr. Newman ocular proof if he is in doubt, and a meeting could be arranged for the purpose.

With these remarks I again couple my heartiest thanks for the refreshment derived from his lecture as reported in the photographic press.—I am, etc.,

GEORGE BANKART.

### GELATINE DRY PLATES.

SIR,—The following extract from Dr. Eder's "Handbuch" will show Mr. Burgess that at least the greatest authority on photography recognises his work:—

"Poitevin first published the use of gelatine as a vehicle for the silver salts in the negative process, in the year 1850. In this year he read before the Parisian Academy the description of his process, which consisted in mixing gelatine with iodide of potassium, and then sensitising in a silver bath. On the 30th of June, 1851, he presented an improvement of this process, by

means of which, by the employment of gallic acid, portraits could be obtained in 1 to 1½ minutes ('La Lumière,' 1851, vol. i., p. 89). Hadow described in the *Journal of the Photographic Society*, in May, 1854, a similar process, but used sulphate of iron for developing.

"Gaudin mentions the first emulsion of silver salts in gelatine.

"Gaudin had already stated in his first notice on collodion emulsion on Aug. 23rd, 1853, that he had instituted similar experiments with albumen and gelatine. (Gaudin says, 'J'ai fait des essais analogues avec l'albumine et la gélatine.' M. H. de Molard m'a dit avoir eu des résultats avec l'albumine.') In the year 1861 he described his process more accurately: he prepared an iodide of silver emulsion with excess of nitrate of silver, which he developed with tannin, or tannin and gallic acid ('La Lumière,' 1861, pp. 21, 25). On the 8th September, 1871, R. S. Maddox published a note on the preparation of gelatinobromide of silver emulsion in the *British Journal of Photography* (1871, vol. xviii., p. 422), and at the same time handed to the Editor of this journal, Mr. Taylor, several negatives of landscapes, views, etc., which had been prepared according to the new process.

"King gave, on Nov. 13th, 1873 (*British Journal of Photography*, 1873, vol. xx.; p. 542), a more detailed description of the gelatine emulsion process, and introduced the washing out of the soluble salts from the gelatine emulsion. In the same number of this journal (p. 544) Johnson recommended that the soluble bromide should be used in excess. This point was later recognised as highly important, and has been adhered to, as a rule, in the preparation of gelatine emulsion.

"The first gelatine emulsion was placed on the market by Burgess, in July, 1873. It was announced in the *British Journal of Photography* of the 25th July, 1873. The formula for his emulsion has never been made known. To him belongs, however, the honour of being the first who actually prepared gelatine emulsion in a satisfactory quality.

"Kennet first introduced, in 1874, the washed emulsion in the form of dry leaves (pellicles), and placed it also on the market. He described his process in the *British Journal of Photography* of April 23rd, 1874.

"Wratten and Wainwright described first in 1877, in the 'Year Book of Photography' (p. 108) for 1878, the pressing of the emulsion through a wide-meshed canvas into water, because the little lumps formed could be easily washed.

"Bennett made a great advance in the preparation of very sensitive gelatine emulsions, when he communicated on the 29th March, 1878, the important observation that an emulsion gained considerably in sensitiveness by a continued digestion at 32 degs. C."—Yours truly,

E. J. WALL.

London.

#### THE FORTHCOMING VIENNA EXHIBITION.

SIR,—Some time ago your journal communicated an invitation from the Club of Amateur Photographers in Vienna to take part in the International Photographic Exhibition Salon in Vienna in the spring of 1891, giving a few particulars about it. You subsequently reminded your readers of it, stating that many of the best amateur workers in this country are preparing for the exhibition, and lately you gave a list of the gentlemen appointed to act as jurors. Getting interested in the matter, I procured the rules under which it is to be held, and they were a source of great astonishment to me. Hearing that a club of amateur photographers was arranging the exhibition, seeing that your journal, the journal of amateur photographers *par excellence*, was supporting the exhibition, and upon the communication that many of our best amateur photographers were preparing for it, I presumed that it would be held upon the principles which are already adopted by all exhibitions promoted by our amateur photographic societies. On the contrary. There is some kind of a preliminary jury, and only photographs that are passed by this jury will be exhibited. But this is nearly the only restriction. It is never asked if the exhibitor is at the same time the producer of the picture. There may be amongst amateur photographers a difference of opinion as to how much of the work shall be his own, but I think they are all unanimous in thinking that uncapping the lens does not constitute amateur photography. Now we do not find the slightest remark upon such trifles in the rules. They are remarkably short. With the exception of reproductions and professional portraits and landscapes, all artistic work is admitted.

I looked up closer information, and heard that the same system prevailed at the first exhibition of the same club in 1888. A distinguished amateur photographer, Mr. Stieglitz, of New York, well known in this country, has just published a note in the *Photographische Rundschau* upon the "Medaillen Regen" which showered down at the two last photographic exhibitions at Frankfurt and Budapest. But this was only the continuation of the system of the late Vienna Exhibition. It is true that our English photographers made a good show on that occasion, and got nearly all, or even all, their medals. But, with the exception of the two or three first medals, many of our best amateur workers, who exhibited there, would have been ashamed if they had seen the work placed in the same rank as theirs.

Now, it is true, on the present occasion, the contrary will take place as far as regards medals: exhibition is already taken as a distinction, and the number of medals is limited. But the other half of the system prevails. The best amateur workers may be placed side by side, in the distinction, with a lady who uncapped the lens perhaps, and allowed the whole work to be done, not by a single person, but by some of the best specialists in the departments of the special work to be done. The list of the jurors which you published lately does not tend to ameliorate this state of things. It is composed of six members, none of whom, with the exception of one, are photographic artists, but all are painters and sculptors.

And last, not least, there was the exclusion of professional portraits and landscapes, contained in the rules. I do not think it essential that professional work shall be excluded if it is the exclusive work of the exhibitor. But the latest information I have received is the following: the Amateur Club of Vienna now gives the rules another explanation, saying that the exclusion of professional work was intended to mean "not artistic" (merci, messieurs les professionnels, you will no doubt go to Vienna and give thanks for the compliment), and the artistic (*sic*) work of the professionals is admitted. Now we have no indication whether this so-called "artistic professional work" (a new thing for Mr. Wall's "Dictionary") will be exhibited in a separate class or mixed.

Your journal, Mr. Editor, has always endeavoured to raise the value of true amateur work, and so have our best amateur workers. I am told that there are not enough amateur photographers in Austria to fill a photographic exhibition, that there are a few good workers, but some of them, and just those of high aspiration for distinction and in a most influential position, do not produce their exhibits themselves. If this be the case, the standpoint held by English amateur photographers may be disagreeable to them. But I cannot see why the Vienna Club of Amateur Photographers cannot fairly hold an exhibition themselves, with the help of English amateur photographers.

Such a competition as planned by the Club of Amateur Photographers of Vienna is not a fair competition according to our standpoint. Now we have raised the position of amateur photography in this country, I hope we shall try to maintain it.—I am, etc.,

AN AMATEUR PHOTOGRAPHER.

\* \* \* \*

#### THE LIVERPOOL EXHIBITION.

SIR,—Photographers are now, probably, selecting their pictures for the forthcoming exhibition at Liverpool, from which we expect so much in the way of reform. One of the much approved new rules is to the effect that no picture of any description shall be entered or allowed to compete which has been previously exhibited in the United Kingdom. The champion class is excepted, but that could scarcely count or be depended on in the instance I am going to cite.

Mr. T. S. Mayne is the Hon. Secretary, who is most responsible for the exhibition, and great praise is due to him for his valuable and energetic efforts to produce a model photographic exhibition, and I am sure many photographers would be obliged if he would explain an apparent discrepancy in his "letter on the Edinburgh Exhibition" in your last. In speaking of a picture he greatly admires, he says, "I hope the artist will send it to Liverpool in March, 1891." What are we to understand by this? If the rule I have quoted is to be relaxed let it be made known, for I am sure there are other exhibitors at Edinburgh and other places who would like to send their pictures to Liverpool, and there is a proverb about the goose and the gander.—I am, etc.,

A POSSIBLE EXHIBITOR.

## ALBUMS FOR ARISTOTYPE PRINTS.

SIR,—As a large worker on Aristotype, I feel greatly the want of an album for suitably mounting such prints. The usual scrap-book form is unsuitable, because pasting in roughens the surface, no matter how you back the prints, and gumming by the edges is unfinished. What is wanted badly is an album in the usual form, with leaves less thick and clumsy, and of good paper, with holes cut for the usual sizes, quarter-plate, half-plate, three-quarter-plate—I do not mean mixed, but a separate album for each size. The albums usually sold are for portraits, carte, and cabinet size, and are unsuitable for the landscape photographer's purpose.

Traders do not make these things unless they are called for. I hope my call will be seconded, and responded to by some of our enterprising photographic stationers.—Yours, etc.,  
Dublin, December 29th, 1890. LOUIS MELDON.

## Composition, and Light and Shade.

*Selected and arranged for the use of Photographers, from "Burnet's Essays," with Introduction and Notes.*

BY H. P. ROBINSON.

## CHAPTER I.—INTRODUCTORY.

A THOUGHTFUL writer noticing a recent exhibition says, "It is easy to see that the first thing, in selecting a scene, the exhibitors have had in mind was to get balance;" and he complains of the monotony, although he had previously well said that "A photographer seeking to produce artistic pictures by aid of his camera must first of all have some artistic training, and be able to recognise the laws that govern the representation of nature in a manner pleasing to man's faculties." This evidence that photographers are not only recognising but also putting into practice the rules of art, although they are not yet able to observe that one of the most subtle and important rules which ordains that the art must hide the art, is most encouraging. It shows that they are studying composition, for balance is the basis on which all artistic composition rests; and gives hope that they will continue their studies until that time arrives when, knowing the laws of art more completely, they may be able to break them with impunity and even with advantage, for it is no paradox to say that the laws of art are made to be broken, but, as the writer I have quoted wisely says, only by men who have genius; and I agree with him that "everyone is ready to acknowledge that although laws may not be broken with impunity, yet it must not be forgotten that the world will also hail as a hero the man that defies them *with success*." It is all the difference between unsuccessful insurrection and successful revolution. It is this success that is so difficult to attain, and we have in the pictorial arts woful examples of those who, daring to defy the laws, have failed.

It is with the hope of teaching photographers to produce their works, if they so wish, decently and in order, or, if they have sufficient genius, to show them what to avoid if they would be eccentric, or what course to follow if they are wise, that I have consented to edit and annotate Burnet's two essays, the one on "Composition," and the other on "Light and Shade," the best and most lucid works on the twin subjects ever written. These Essays were written exclusively for the use of painters, but the principles of art belong to all art, and photographers will find much, not to copy, but to guide them, in the selection and arrangement of their subjects.

The chief interest in photography amongst amateurs, and to a great extent also with those professionally engaged, must ever centre in its capacity as a pictorial art. If facts only are required, such as in the records of scenes we visit, or in the portraits of our friends, we all desire to make

those facts pictorial, and would certainly oftener do so if we knew how to accomplish it. This can only be done by those who not only recognise and know what is pictorial, but also understand why it is pictorial. "Burnet's Essays" may be said to concentrate this knowledge into the smallest space.

It is quite true that the greatest and grandest elements of pictorial art cannot be taught, just as no schoolmaster can turn out poets at will, yet can teach even dunces to read and write with some approach to correctness; and, on the other hand, if he had not learned to read and write, not even the heaven-born poet would be able to express himself intelligibly. To sing the song of art in proper grammatical and musical form, instead of as the babbling of an untaught infant, is the object of these essays, and they make no pretence to teach more (and I am anxious to emphasise this statement). Notwithstanding which they will be found a very solid and safe foundation on which to "build the lofty rhyme."

To the photographer, then, who desires to produce pictures, a knowledge of the rules of art is of the most emphatic importance. From the nature of his art he is less called upon to give a form to pictorial conceptions than give pictorial embodiment to existing facts, and it is often only by arrangement of materials and management of light and shade, that a pictorial character can be given to the representation of prosaic facts. To the painter who can give interest to his pictures by the beauty of his subject, by the thought represented, or by the glamour of colour, some disregard of the laws of art may occasionally be permitted without pictorial loss; to the photographer who would excel as an artist, a rigid attention to all that can be reduced to rule, or quasi-rule, becomes imperative, for the reason that it often forms his sole means of elevating his work beyond the rank of a mere diagram or plan and elevation of some very commonplace and unpictorial piece of nature's handiwork, whether animate or inanimate; above all, a knowledge of what constitutes pictorial effect will enable him to see pictorially.

I say this well knowing that there are those who object to all rules and laws in art, and, throwing the experience of ages to the winds, would have every one begin afresh; a method, by the bye, which, if generally adopted, would keep the world in continual childhood. This unintelligent craving for something new, this vain struggle to do not as others do, this desire to make laws unto themselves, is not only unprogressive but unnatural, for evolution is a law of nature, and all things good "broaden slowly down, from precedent to precedent." All new things are but the recomposition of the old elements, and end in partial imitation after all.

It has also been objected that anything in the form of rules or laws would lead to conventionality. This is an objection without a meaning, for all art is more or less conventional. It would scarcely be an exaggeration to say that the best art has been the most conventional, and that the nearest approach to mirror-like fidelity to nature has always been the worst art. A simple transcript of nature by photography is not art, but if the photographer shows that the operator used photographic materials as a means of making a picture, and succeeded, the photograph may rise to the dignity of fine art.

There is no intention in these rules to degrade the pictorial representation of nature to the level of a strict formula. It has been objected that a law to be logical must hold good in all cases; to which it may be easily answered that when art becomes logical, or one of the exact sciences, it will cease to be art.

"These rules, of old discovered, not devised,  
Are nature still, but nature methodised."

Burnet's "Essays on Art" were published at different periods—"Composition" in 1822, "Light and Shade" in 1826. Two other essays were subsequently published, but they would have little interest for photographers, and probably tend to confusion. They have long been out of print, and the price when they do occur for sale at second-hand book shops is an enormous increase on the publication price. The artist who now possesses the Essays esteems himself as the possessor of a treasure. All artists, therefore, as well as those who practise photography only, will be glad of selections from these invaluable works. I may now briefly allude to the principal characteristics of the two Essays.

In the Essay on "Composition," Burnet explains what the subject is and means, and goes on to give a lucid description of what may be called, for convenience, the rules of composition, but by which, however, it is not intended that the subject can be reduced to strict laws. These rules are illustrated by etchings by himself from the works of the most famous masters.

In "Light and Shade" our author begins by giving all the most self-evident and palpable combinations, and gradually leads the student to the consideration of more intricate subjects, illustrating every proposition by sketches; and in a subject of this kind a slight sketch is more useful than many words. As the author himself says: "Painting is a practical branch of philosophy, and can only be rendered clear by satisfying the observations of the eye as well as the reflections of the mind; this, perhaps, is the reason why so much has been written on the subject without those truths being sufficiently obvious which the writers wished to demonstrate."

Although published so many years ago, these Essays are as fresh and useful as if written yesterday. Nothing essential has been added to or taken from the fundamental principles of art since Burnet wrote, except, indeed, by impressionist and naturalistic painters, who ignore all that has gone before in art, from the Egyptians to the present time. The simplicity and clearness of the writing of the Essays adds greatly to their charm. You have only to read a paragraph, and look at the accompanying illustration, and the meaning is clear to the most ordinary mind. The author has taken the greatest care not to overload his work. Every word and illustration is to the purpose, and there is nothing superfluous.

Burnet frequently alludes to colour, and its effect on composition. These observations may be thought useless to the photographer, but I have left them in, for although the photographer's practice may be confined to the effects of form and chiaroscuro, they do not interfere, and he cannot know too much of art generally.

Finally, it has been the chief wish of my photographic life to see the art-science truly attain to the dignity of a fine art, and that must be my excuse for recommending so strongly to photographers, both professional and amateur, the best elementary guide to the subject.

(To be continued.)

## Photography with a Purpose.

By ADOLPH. W. BEER.

THE landscape photographer who takes an interest in his especial line of work, apart from its technicalities, must of necessity keep his mind, or note-book, stored with reminders of promising but as yet unvisited districts, for illustration at some convenient time; and to what pleasanter or more profitable use can we put our accomplishment than permanently recording in unimpeachable characters the

scenes that lie around us? This is eminently so if, at some trouble and risk of possible disappointment, we search out for what is not already well trodden ground. The artist has small chance of fame if he persistently copies the work of others, or selects his subjects from localities already made notorious as picturesque pot-boilers; but, on the other hand, have we not numberless examples where kudos and more solid advantages have been reaped by men whose aim has been to work out of the beaten tracks, in quiet, lovely, almost unknown corners *not* done to death by lazy copyists?

We look at this subject from the standpoint of an amateur landscape photographer pure and simple, and are not ashamed to confess that in our rambles "all is fish that comes to the (dry plate) net," *if it only makes a picture*, or is fairly illustrative of the district or any local peculiarity, for what can be more annoying in preparing a topographical sketch than to find you have omitted a view which would be of the greatest value in filling up a gap or elucidating a description? Upon this point we are inclined to think there is a good deal of nonsense talked and written, with the object of attempting to induce landscape photographers never to make an exposure unless satisfied that all the essentials of a picture are there, and never wasting a plate if the light is not exactly right and perfect. If we had adhered to this rule, we should have been without some of the most valued negatives we possess. So have no hesitation in advising the amateur to err on the side of liberality, and when he sees his picture make the best of it for the time being; he may never again have the same opportunity, for how many times do we recall pictures "we left behind us"?

The great attraction to the topographical photographer is to make studies that will, as the years roll on, be increasingly interesting to himself and valuable to his fellow men. For many years past, some of us, in a small and quiet way, have been laying up records of the picturesque nooks and corners of our native land—especially devoting attention to what may be called, for want of a better term, picturesque antiquities, of all and sundry kinds—but though the field is large, the labourers are few, and many of the most charming subjects are one by one lost to the world of art often unnoticed and unmarked. Can it be wondered then that a feeling of personal loss is oft experienced, as we read of an old church and its contents being destroyed by fire or the hand of the "restorer," or a grand and unique manor house fallen into ruins or pulled down, tempered, it may be, by the knowledge we have good negatives of them in our plate-boxes, possibly intensified by the thought we have missed taking advantage of a moment that will never return.

It is to some temperaments the acme of pleasure to get as far away from home as possible when on holiday thoughts intent, and certainly for fresh sights and novel sensations, foreign pictures at one time had an undoubted charm; but now-a-days, when nearly everybody crosses the "silver streak" as a matter of course, much of the novelty has worn away, and our minds are free to think of the fertile fields at home, where, scattered with a lavish hand throughout our English counties, are countless subjects worthy of reproduction by our faithful cameras.

To one who has for so many years made this class of work a special study occasionally comes the overwhelming conviction that never in one lifetime can the task be adequately accomplished, but let us each do our best to render the work as complete as possible.

So, to our fellow amateurs who desire an object and an aim in their hobby, we strongly urge the above points, inviting them to make photographic records, as thoroughly as may be, of any section of the country they may chance to be located in, temporarily or permanently, not resting content to just "potter about" as so many amateurs do, but per-

severingly exploring highways and byeways, old roads and disused lanes, field paths and bridle roads, securing studies, often so delightfully picturesque, of old manor houses now in the occupation of farmers, village scenes quaint and rare, church porches and curious epitaphs, mediæval tombs and Norman arches, or those scant relics of antiquity that require knowledge and diligent search to discover. Read up the bygone records of the selected locality, before or while working, and a rich reward will be ensured in pleasant memories, increased information, and possibly valuable additions to the stock of general knowledge, while at the same time a feeling of satisfaction will be engendered in the mind, knowing that *your* hobby-horse is not of the wooden, purposeless nature some are apt to degenerate into.

## Photographic Work for the Winter Months.

BY T. PERKINS, M.A.

### CHAPTER 1.

#### OUT-DOOR WORK.—ARTISTIC.

OUR summer's holiday is a thing of the past; no longer can we wander with our well-loved and constant companions, camera and lenses, through the leafy lanes of Devon or the pleasant valleys of Wales, or take snap-shots at groups of pleasure-seekers on the sands at fashionable sea-side towns, or at the beautiful start or exciting finish of some yacht race. The winter fogs, yellow with smoke, often render photographic work almost an impossibility in our large towns, and even in the country though they are of a more actinic colour, yet they often enwrap every object in an impenetrable haze. Many, no doubt, are the lenses that, like hibernating animals, have retired for a winter's repose to their wash-leather bags or velvet-lined cases; many too the cameras that, having been well dusted, have been laid carefully by until such time as

"With tears and smiles from heaven again  
The maiden spring upon the plain,  
Comes in a sun-lit fall of rain.  
In crystal vapour everywhere,  
Blue isles of heaven laugh between,  
And topmost elm-trees gather green  
From draughts of balmy air."

But to be severed for so long a period from that which is dear to us is a great trial, and we ourselves being enthusiastic photographers, cannot bring ourselves to endure such a separation from apparatus and chemicals. Nor indeed is it necessary. Much work can be done in the winter months, and some of it much better than in the summer—some of it can only be done in the winter.

A few classes of such work it is our object now to point out for the benefit of our fellow amateur photographers, most of whom no doubt are readers of the periodical which from its very name appeals especially to them.

The winter months will provide both the artistic and scientific photographer with outdoor work, as well as occupation for dull days and even for long evenings at home.

That which will occur probably to most will be the possibility of securing snow scenes, but in our opinion such pictures are rarely successful and seldom pleasing. It might be supposed that photography was especially suited to the representation of nature arranged in her white garb, when the unobservant eye might suppose that white and dark brown were the only colours present in the landscape, but at no time does nature so much require the aid of colour to represent her beauties as when snow lies on the ground.

The snow wreaths and drifts obliterate the outlines of objects so that in many cases beauty of form is lost, and all depends on beauty of colour, and colour too of the most subtle kind—the delicate rose flush on the edge of the snow cloud sombre in its massive folds, the sparkle of the sunlight on the edges of the newly-fallen snow, the delicate blue shadows in the hollows and furrows. Occasionally beautiful snow pictures may be produced under exceptional circumstances by means of photography; one example of which may be found in the first number of *Sun Artists*—Mr. Gale's "Foggy Day on the Thames"—although we should have preferred to see the subject rendered in grey rather than in brown. Another subject which we have never seen attempted would make, could it be well rendered, a charming picture—a group of sheep huddled together for shelter under a lofty bank, while the snow is falling from a leaden sky and whirled away over their backs. Such a picture would require the use of a large aperture, for the light would probably be poor; but any loss of sharpness would be well compensated for by the artistic nature of the subject; nay, in such a subject we are far from thinking that a judicious application of the principles of the naturalistic school would be out of place, and printed in the cool greys of platinotype such a picture would be singularly beautiful. Of course, such a scene is not to be found everywhere, or every day, and it cannot be previously arranged, depending as it does on a combination of many circumstances of time and place and atmospheric conditions. But, as we have said, snow scenes are not easy to render; painters seem to avoid them, knowing, no doubt, the difficulty of painting the snow in its right colours, and the difficulty of managing such large masses of white in their pictures.

The effect of hoar frost is often very beautifully expressed by prints in platinum—views, we mean, in which trees are represented with their thick coats of rime on every branch and twig. Chances of getting such effects may come any winter, but when they are offered no time must be lost, for the effects are generally short-lived. The conditions for the production of these effects are (1st) an entire absence of wind, (2nd) a temperature not far removed from freezing point, (3rd) an atmosphere heavily laden with moisture in the form of fog which freezes on the branches of the trees, which are already of a lower temperature than 32° Fahrenheit, forming on the side exposed to the drift of fog, a coating which gradually increases till, perhaps, it is half an inch or more in thickness. Then if it should chance that the mist lifts a bit, the sky remaining grey, the right time for taking the photograph is presented to us, and we must seize the opportunity at once, for the slightest breath of wind will shake the rime from the trees; the warmth of the sun, if it shines, will also detach it from the branches, and, moreover, direct sunlight will spoil the effect in a picture. It would be well for those who are thinking of attempting hoar-frost photographs to select a promising spot beforehand, some group of tall elms, for instance, in a field or grassy lane, on the blades and bents in which hoar frost will also settle, the trees themselves, with perhaps the addition of a field gate or cottage, composing well. The picture should be well arranged beforehand; it is usually too late to begin to look for the subject when the hoar frost has already formed.

Again, another subject for artistic photographs in the winter months, will be found in the mighty boles of forest trees. The beauty of tree trunks is generally overlooked, but great the beauty is of the gnarled and knotty trunk and crooked lower limbs of some old oak, the gigantic bole of a beech, especially if it has been pollarded long ago, like those of the far-famed Burnham Beeches, with its smooth bark and vertical folds, its massive bosses, its far-spreading roots, and its patches of lichen, bright yellow or tender grey.

And many of these characteristics are best secured in a photograph taken when the branches are bare of leaves, for in the summer the thick foliage casts too heavy a shade upon the trunk, or if the sun pierces here and there, patches of light, which may not lend themselves to pictorial effect, fall on trunk or ground. The carpet, too, of fallen leaves, the leafless briar, the withered bracken, all come in as useful accessories. A forest glade in winter, too, will make an artistic picture; the graceful birch, with its silvery bark gashed here and there with brown cracks, and its light ramification and slender twigs, is especially beautiful in winter. And possibly, here and there, an evergreen tree, a pine or cedar, may be found, its foliated boughs contrasting well with the bare branches around it. For such scenes as these, still, sunny days should be chosen, and there are many of these at times in winter, when the ground is hard with frost but no snow has fallen, and a thin mist hanging amid the trees gives the effect of distance to the background. Then, again, what lovely and artistic effects may be obtained on winter days of sheets of water over which other sheets of mist are hanging.

In towns, winter is oftentimes unlovely, with its snow trodden by feet of men and horses into grimy slush, and its sunlight murky struggling through smoke; but those who live in the country know how beautiful it often is there, and we are sure that the photographer who sallies forth when the swallows come, and puts his camera by when they leave our shores, misses many an opportunity of doing good artistic work. He, too, who goes to the seaside will find subjects there not so easily secured in summer. It is true that the terraces of lodging houses will look dull and dreary, that there will be an air of sleepiness about the streets, that the sands will be deserted, the dancers' feet will no longer fall with rhythmic cadence on the polished boards, nor "music clash from the lit pavilion" at the end of the pier; but the artist who loves his art does not find his chief or only joy in the usual amusements got up for the benefit of the summer visitor—nay, when these are gone, gone also is much of the vulgarity which mars so many of our lovely seaside places, out-of-the-way nooks which in our youth we remember "yet untroubled by the tourist, touched on by no travel book." True we cannot get rid of the monster hotels doing their best, with their hideous architecture, to destroy the beauty of the place, yet at any rate we can find the shore, the cliffs, the caves, the sea-girt rocks in their native beauty, and photograph them without the presence of the fashionable costumes of the day, which it is almost impossible to get rid of during "the season." We are not misanthropes, and can gaze with pleasure on the happy faces of holiday makers enjoying the pure seaside breezes, especially if we know that they were yesterday, and will be to-morrow, hard at work under the smoky skies of some manufacturing town, or toiling amid the fret and din of London life; but yet we must confess that as photographers in search of the artistic we could well dispense with their presence and find more pleasure and better pictures on a lonelier shore. In winter even; by the seaside, we need not at mid-day, if the sun should shine out through rifts of clouds, despair of getting so-called instantaneous effects of stormy waves and sky, and we may always remember that though for some subjects direct sunlight on the principal object may be necessary, yet there is a beauty in grey days and quiet scenery; that figures are not always necessary, and if they are not present the longer exposure which the weaker light of winter requires may be given. What has been said will just indicate some of the lines on which the artistic photographer may work. In the next chapter we intend to treat on outdoor work of a scientific character.

## Photographic Tonality.

By T. L. BUCK.

I HAVE no doubt that a great many people, more especially amateur photographers, often wonder why it is that the, to them, beautiful productions of photography should be held in such light esteem, in many cases amounting almost to contempt, by artists generally (mark, *artists*; we do not recognise as such all who "profess" to paint, etc.; there are many painters, few artists). I have no hesitation in saying that the wretched tonality of the majority of photographic productions is the chief cause of this; and who that has any knowledge of tonal values can wonder?

I freely admit that we labour under a great disadvantage, so far as regards the ordinary dry plate which is not corrected for colour, seeing that it is so much more sensitive to the blue than the red end of the spectrum; but when we know the weakness of our tools we should accept the knowledge, and, making our deductions, try to overcome such weakness, which I maintain can be done to a very satisfactory extent.

The ordinary form of dry plate, as we all know, is far more sensitive to the cool blues and greys than to the warm reds, browns, etc. This is an inherent weakness of the emulsion; but why, I ask, intensify such weakness? which is almost universally done, and no wonder, seeing that we are taught to do it, I may say, by nearly every one of those who write books, etc., for our instruction.

Now in regard to development. Are we not told to "develop slowly"? "Keep down the accelerator" seems to be the burthen of the song. This doctrine, I maintain, is altogether wrong—and capable of what? Of begetting as wretched tonality as anyone could wish for. And why? For this reason: it allows those parts of the plate most acted upon during exposure—*i.e.*, the places acted upon by the blues and greys—to gather a density out of all proportion to their tonal value, and keeps the very parts of the plate least acted upon—*i.e.*, by the reds, yellows, etc.—from having the energetic accelerating they need so that they may assume their proper gradations and tonal value; in fact, it just intensifies the very weakness we have to fight against.

I say, cut exposures short (for reasons given hereafter), and use a developer strong in accelerator and weak in oxidising and restraining agents. Press development upon those parts that need it, before those parts most acted upon have time to gather an opacity out of all reason. No fear need be had that more density will be got upon those parts least acted upon by light than is their proper portion, the high lights will always take care of themselves.

The reason why I say, cut exposure short, is this: if exposures are *not* short, an energetic developer would cause flatness, fog, and hopeless failure.

Nature is never chalk and soot; black and white are to a great extent unknown quantities.

If we want to raise our fascinating art to the rank of a real art, we must look to tonality as our greatest weakness, and once thoroughly overcome this, I maintain that photography as a monochrome process will stand pre-eminent and unrivalled.

**Dinner to Mr. J. A. Sinclair.**—On the 22nd of December a number of friends entertained Mr. J. A. Sinclair to dinner at Galt's, in Church Street, Liverpool, on the occasion of his departure for London. Mr. Sinclair has become widely known in Liverpool, in connection with the Artists' Club, of which he was Secretary, and the Amateur Photographic Association, in which he served on the Committee, besides being a noted prize-winner at competitions. Mr. W. Tomkinson, as being a member of both clubs, was voted to the chair, and under his auspices a most agreeable social evening was spent.

## Chemistry for Photographers.

By C. H. BOTHAMLEY, F.I.C., F.C.S.

(Continued from page 433.)

A NUMBER of salts exist which, whilst belonging to one or other of the four classes already described, differ from the salts previously mentioned in that, with only one acid, they contain at least two metals. They are called *double salts*, and are formed by the direct combination of two salts, as in the case of ordinary alum, which is potassium aluminium sulphate,  $K_2SO_4 \cdot Al_2(SO_4)_3 \cdot 24H_2O$ , or, if the acid is not monobasic, by the replacement of different atoms of basic hydrogen by different metals, as in the case of the so called microcosmic salt, which is ammonium sodium hydrogen phosphate,  $(NH_4 \cdot Na \cdot HPO_4)$ , and is formed from phosphoric acid ( $H_3PO_4$ ) by the replacement of one atom of hydrogen by the group ammonium ( $NH_4$ ), and of another by sodium, whilst the third atom of hydrogen is left.

Double salts are usually formed by mixing solutions of the constituent salts, and, if necessary, evaporating the liquid to the crystallising point. Sometimes the properties of double salts are a combination or a mean of the properties of their constituents, but not unfrequently this does not hold good. In many cases a double salt is readily soluble in water, whereas one of its constituents may be insoluble. Several double salts play an important part in photographic operations.

EXPERIMENT 84.—To a small quantity of mercuric chloride solution, add a few drops of potassium iodide solution; a scarlet precipitate of mercuric iodide ( $HgI_2$ ) will form. (Compare Expt. 15.) Now continue to add potassium iodide and agitate the liquid; the scarlet precipitate will redissolve and a colourless solution will be formed. Mercuric iodide combines with potassium iodide to form the colourless double salt, mercuric potassium iodide ( $HgI_2 \cdot 2KI$ ), which readily dissolves in water.

EXPERIMENT 85.—To a solution of silver nitrate add a small quantity of potassium cyanide\* solution; a white precipitate of silver cyanide ( $AgCN$ ) is formed. Continue the addition of the potassium cyanide, and silver potassium cyanide ( $AgCN \cdot KCN$ ) is formed and readily dissolves in the water.

EXPERIMENT 86.—To a solution of ferrous sulphate add a few drops of potassium oxalate solution; a yellow precipitate of ferrous oxalate ( $FeC_2O_4$ ) separates. Continue the addition of the potassium salt with vigorous agitation, and the precipitate disappears, and a deep orange solution of the double salt, ferrous potassium oxalate,  $FeC_2O_4 \cdot K_2C_2O_4$ , is formed. This solution constitutes the ordinary ferrous oxalate developer.

EXPERIMENT 87.—To a solution of silver nitrate add one or two drops of a solution of sodium thiosulphate ("hypo") ( $Na_2S_2O_3$ ); a white precipitate of silver thiosulphate ( $Ag_2S_2O_3$ ) will form, but will rapidly become black owing to its decomposition into silver sulphide ( $Ag_2S$ ). To another portion of the silver solution add "hypo" solution gradually, but somewhat rapidly, with vigorous agitation; you will observe that the white precipitate redissolves, and a colourless solution is formed. The silver thiosulphate combines with the excess of sodium thiosulphate to form the double salt silver sodium thiosulphate ( $Ag_2S_2O_3 \cdot 2Na_2S_2O_3$ ), which is readily soluble in water, and is much less liable to change than the simple silver thiosulphate. The formation of this salt takes place in the operation of fixing silver images.

It has already been stated that the crystals obtained from a solution of sodium sulphate (Expt. 78) consist of the salt combined with a certain quantity of water, and the

formula of alum given above shows the presence, in the crystals, of a large proportion of water. Salts can, in fact, be divided into two groups, *anhydrous* salts, which contain no water in combination, and *hydrated* salts, which, in the solid state, consist of the salt combined with a certain number of molecules of water.

EXPERIMENT 88.—Powder, separately, some of the potassium nitrate obtained in Expt. 74 or 77, some silver nitrate, some potassium bromide, and some sodium chloride (common salt). Dry the powders by pressing them between blotting paper or filter paper, and heat a portion of each powder in separate test tubes, which must be quite clean, and dry. Observe that no water condenses on the cold parts of the tubes. These salts are *anhydrous*; they contain no water in combination.

EXPERIMENT 89.—Make similar experiments with soda crystals (washing soda), zinc sulphate (obtained in Expts. 65 and 75), magnesium sulphate (obtained in Expt. 67), and sodium thiosulphate ("hypo"). Observe that every one of these salts gives off a considerable quantity of water; they are *hydrated* salts, and contain water in combination.

EXPERIMENT 90.—Place small quantities of crystallised zinc sulphate, magnesium sulphate, copper sulphate (obtained in Expt. 76), and soda crystals, in crucibles or on watch glasses, and heat them for some time at a moderate temperature, say, on the top of an oven. If you weigh the crucibles or watch glasses, and their contents before heating, and weigh them again after they have been heated for some time and have been allowed to cool, you will find that they have lost considerably in weight, because the greater part of their water has been expelled. Examine the residues, and you will see that the crystals have become opaque, and have crumbled to a powder, and that the copper sulphate in addition has become almost white.

Since the expulsion of the combined water from a salt causes the destruction of its crystalline form, such water is called *water of crystallisation*.

Sometimes all the combined water in a salt is water of crystallisation; sometimes part of the water is more intimately combined with the salt and is more difficult to expel. Analyses show that the sulphates previously mentioned have the composition indicated by the following formulæ:—

Copper sulphate,  $CuSO_4 \cdot 5H_2O$ .

Ferrous sulphate,  $FeSO_4 \cdot 7H_2O$ .

Magnesium sulphate,  $MgSO_4 \cdot 7H_2O$ .

Zinc sulphate,  $ZnSO_4 \cdot 7H_2O$ .

Now it is found that if these salts are heated for a sufficient time at  $100^\circ C$ ., four out of the five molecules of water in the copper sulphate crystals are expelled; the residue is almost colourless, but still contains one molecule of water and has the composition  $CuSO_4 \cdot H_2O$ . In the case of the ferrous, magnesium, and zinc sulphates, six out of the seven molecules of water are expelled at  $100^\circ C$ ., and the residues have the composition  $FeSO_4 \cdot H_2O$ ,  $MgSO_4 \cdot H_2O$ , and  $ZnSO_4 \cdot H_2O$  respectively. In all cases the salts have lost their crystalline form, and hence in the case of the copper salt the four molecules of water, and in the case of the other salts the six molecules of water, are the true water of crystallisation. The remaining molecule of water is more intimately combined with the salt, and can only be expelled at a much higher temperature, about  $200^\circ C$ .; it is called *water of constitution*.

It is quite clear that when we are calculating the quantity of a given salt required to produce a given change we must, if it is a hydrated salt, take into account the quantity of combined water which it contains. For example, the quantity of anhydrous sodium carbonate ( $Na_2CO_3$ ) required to precipitate 340 parts of silver nitrate in accordance with

\* N.B.—Potassium cyanide is extremely poisonous.

the equation  $2\text{AgNO}_3 + \text{Na}_2\text{CO}_3 = \text{Ag}_2\text{CO}_3 + 2\text{NaNO}_3$ , would be  $46 + 12 + 48 = 106$  parts, but if the hydrated sodium carbonate  $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$  (soda crystals) were used, we should require  $46 + 12 + 48 + 180 = 286$  parts, a very considerable difference.

Many solid acids resemble salts in containing combined water; for example, oxalic acid ( $\text{H}_2\text{C}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$ ) and citric acid ( $\text{H}_3\text{C}_6\text{H}_5\text{O}_7 \cdot \text{H}_2\text{O}$ ); and this must likewise be taken into account in calculating quantities of these acids.

(To be continued.)

## Instantaneous Photography.

By W. JEROME HARRISON, F.G.S.

### CHAPTER X.

THE SENSITIVE PLATE UPON WHICH THE IMAGE IS TO BE IMPRESSED BY LIGHT.

*Material Used as a Support. (Continued.)*

**Black Leather** was not unfrequently used during the collodion era (1851-1880), as a support for the positive pictures, or ambrotypes, on collodion. These required some black material (black varnish was commonly employed) as a backing, to give contrast to the high lights.

(4) **Glass.**—Sir John Herschel was one of the first to draw attention to the three great advantages possessed by glass as a support, viz., rigidity, transparency, and impermeability. There is a precious relic in the South Kensington Museum, a photograph of the famous "forty foot" telescope erected at Slough by the elder Herschel, and photographed on a glass plate by his son, Sir John Herschel, in 1839.

But the first process in which glass came into general use was the "albumen process" of Niepce de St. Victor, published in 1847. In Scott-Archer's collodion process, too, glass was almost universally employed.

The *rigidity* of glass is a valuable property. It is much easier to handle a firm, rigid glass plate than a limp piece of paper or "film." Glass does not need anything to support it in the printing-frame, and it is more transparent (and therefore allows printing to be performed through it more rapidly) than any other substance.

By its *impermeability*, glass keeps on the surface the sensitive coating applied to it. It is also practically *unacted upon* by nearly all chemicals; and this is another necessary quality in any material employed as a support.

The principal disadvantages of glass are its brittleness and its weight. These disadvantages are, however, more felt in large-sized plates than in small ones; most makers now select *thin* glass for the quarter-plates ( $4\frac{1}{4}$  by  $3\frac{1}{4}$  inches) almost universally employed in hand-cameras; and these small plates will stand a good deal of careless usage without breaking; although, to be sure, when a plate *does* come to grief, it is certain to be "the best negative of the lot." We must confess to a great liking for glass as a "support."

**Mica.**—Mica is a mineral which is capable of being split into light, thin, flexible, and transparent plates. Since it can be cut readily with a pair of scissors, it has been coated and used occasionally for photographs which it was desired to fit into oval lockets, etc. Plates of mica of any size would be difficult to obtain and expensive; at least of the fine quality which would be needed for photographic purposes. But for the small sizes used in hand-cameras, it seems to us that mica might be afforded a further trial. Its great advantage is that it combines rigidity with lightness, and sufficient flexibility to prevent breakage by a fall.

**Celluloid.**—The inventor of celluloid was a Birmingham chemist named Parkes, who patented his discovery in the

year 1856. He obtained it by dissolving a form of gun-cotton in certain solvents, with the result of producing a compact, horny, buff-coloured substance, which has been largely used in the manufacture of combs, piano-keys, knife-handles, etc. The manufacture of celluloid has been carried on mainly in the United States and in Paris.

In the year 1888, the American manufacturers succeeded in obtaining a *transparent* form of celluloid, mainly, it is believed, by the use of camphor, and of a solvent known as amyl acetate (familiarily designated "pear-drop essence") whose odour is strongly perceptible in the thin rolls of celluloid manufactured by the Eastman Company.

The well-known American plate-maker, Mr. John Carbutt, coated films of this new (transparent) form of celluloid, and put them on the market in the latter part of the year 1888. Messrs. Anthony, of 591, Broadway, New York, had experimented with celluloid even before Carbutt, and the coated sheets of this material which they sell under the name of the "Climax Film" are of most excellent quality. These "cut sheets" of celluloid are about the one-hundredth part of an inch in thickness; and they are only one-fourteenth the weight of glass plates of the same size.

During the next year (1889) the Eastman Company succeeded in manufacturing transparent celluloid in sheets, only the three hundred and fiftieth part of an inch in thickness. This film is "rollable," and is used in the Eastman roll-holder, being wound off one spool or roller on to another. A large factory has just been built at Harrow, near London, to manufacture this material specially for the European market. The "rollable" celluloid film is only about one-fortieth the weight of glass possessing the same amount of surface.

Another advantage of celluloid is that the spreading or reflection of light called "halation" is much less than with glass. One side of the celluloid film is usually made "matt," like the surface of ground-glass, and it has long been known that this "matt-surface" was effective in diminishing halation. Celluloid has been well described as "flexible glass." Its great advantages are its lightness, its flexibility, and the power of manufacturing it in such lengths that twenty or thirty consecutive exposures can be made upon one band of celluloid. By joining the ends of two or more bands together (and this is usually done) we can get a "roll" sufficient for one hundred exposures. The only objection to this is that there is necessarily a flaw at the junction of the bands, and that this flaw will be pretty certain to spoil one picture of the set taken.

In the process of developing, the celluloid films have a tendency to rise or bulge up above the solution in the developing-dish. This must be prevented by the use of a good depth of the liquid, and by occasionally passing a camel-hair brush over the films.

Still another point to be considered in connection with celluloid as a support, is the *price*. At present celluloid films cost nearly twice as much as glass plates.

[*Memorandum.*—I read with interest Mr. Burgess's letter in last week's AMATEUR PHOTOGRAPHER, in which he claims to be the discoverer of the gelatino-bromide process. In my "History of Photography,"\* I have, as I believe, given Mr. Burgess due credit for his share in drawing attention to the claims of gelatine. But he must remember that in the scientific world it is a strict rule that the credit of any discovery belongs to him who first publishes it for the benefit of his fellow men. Now, according to Mr. Burgess's own showing, it appears that he preserved the matter as a trade secret.

But I must altogether deny that Dr. Maddox is to be ousted, even on that ground. His formula was *not* unworkable. I have prints made from negatives taken by Dr. Maddox in 1871 (and I believe Mr. Traill Taylor has both prints and negatives), which

\* Published by Percy Lund and Co.

prove that Dr. Maddox's gelatine process, even at that date, only wanted the care of an expert in photography (a position to which Dr. Maddox never laid claim, his aim being scientific only) to produce excellent results. The whole question, moreover, was discussed by the jury at the great "Inventions" Exhibition of 1885; and the award of the gold medal to Dr. Maddox for his discovery of the gelatino-bromide process shows what was thought of his work by such men as Capt. Abney, etc. As Mr. Burgess did not then urge his claims, I think he is not well advised in bringing them forward now.—W. J. H.]

(To be continued.)

## Photo-Micrography.—I.

BY ANDREW PRINGLE.

### INTRODUCTORY—APARTMENTS—GENERAL ARRANGEMENTS.

THE use of photography for recording purposes is becoming daily more common, as its excellencies are being daily discovered and admitted, and one of the most important branches of record is the record of the microscopical image which we can obtain by photography in a manner far more true, more convincing, more speedy, and more simple than by any other graphic process.

In photo-micrography we have a series of microscopical operations, another of photographic operations; by skill alone in both branches shall we produce thoroughly good photo-micrographs. To produce mediocre micrographs requires only a middling microscopist and a fair photographer; to produce the best results we must have the best instruments, and the greatest skill in microscopy and in photography.

It is not my intention to descant here on the pleasures or uses of the science which forms my subject; my duty is to point out, as clearly yet as succinctly as may be, *some* methods by which photo-micrographs can be produced as well as I can produce them myself; but I would never undertake to describe *all* the methods available, and still less would I venture to assert that my way is the only way.

Perhaps the chief difficulty facing the writer on photo-micrography for amateur readers lies in the fact that different readers have different aims. One wishes to take up the science and carry it to its highest point of difficulty and excellence; another, perhaps, proposes to confine his attention to simple apparatus, easy objects, low magnifications, relaxation rather than labour, amusement rather than study. I may make a mistake, but I propose to point rather to results of the highest character from objects of considerable difficulty, than to ordinary and easy results from simple "stock" preparations. As my own apparatus is by no means excessively costly, and as my general appliances are little beyond those possessed by any amateur photographer who does a fair amount of ordinary work, my suggested methods, though pointing to difficult work, may—and I hope they will—be found sufficiently simple and inexpensive for those who do not quite "aim the moon."

I take for granted that my reader has some kind of apartment and arrangements for ordinary photography. No great size of either is necessary, as we shall deal but sparsely with any larger size than quarter-plates. The beginner almost always runs off to large images on large plates, but if he possess only a half-plate camera, he will save himself much loss of time and trouble.

The most important point in general arrangements is to secure for the microscopical and exposure parts of the work

a perfectly steady apartment. Unless exposures are to be quite short, unless our magnifications are to be low, or our illumination very bright, as direct sunlight, our room must be solid, the floor well laid, and the operating table strong and standing firmly on the floor. Failing either or both of these, the next best plan is to have everything, except the several parts of the actual apparatus, moveable and free. The table or the base bearing the apparatus may be mounted on cubes of caoutchouc; very good work in high powers has been done on an apparatus slung from the ceiling, the point being that if any part moves, the whole of the apparatus moves together. A cellar is probably the best place, so far as steadiness goes, but dampness, if present, will injure the apparatus. Vibration is to be avoided; but if there must be vibration it should be synchronous as regards the component parts of the illuminating, optical, and photographic systems.

This "dark" or operating room used for ordinary photography will answer for our special branch, but a ruby light must be provided as we shall have to use colour-correct plates for many of our objects. If we have to deal with the most difficult stains we must provide a dark-green glass in addition to our ruby. Our dark-room illumination must comprise some kind of standard actinic light, *i.e.*, some source of light which burns, or can be made to burn, with a fixed visual brilliance, for it is necessary to judge very accurately at a certain stage of development what points of detail and density our negative has reached, and without a standard light this is impossible, for comparison by experience is our only real guide. An oil lamp with the flame-height marked by a projecting arm, a "standard" candle, or a "regulator" gas-burner will answer this purpose. The illuminant is, of course, inside the non-actinic lantern.

The photo-micrographer aiming at high-class work should, so far as possible, have his mind free from all sorts of distractions during the times when he is arranging his object in the microscope, and when he is developing his plate. However sharp may be our eyes, it is necessary to secure complete concentration of mind for the time being at least. Therefore, two things are urgently needed: a good light and perfect order. The light must be "safe," but it should be plentiful. And there should be no confusion of bottles and dishes in the dark-room. Very few bottles are required during development, and very few dishes, and each bottle and each dish should have its own place.

A water tap and a waste sink are such great conveniences that much may with wisdom be sacrificed in order to obtain these. The dark-room and the microscope room may be one, or they may be adjacent, but for a tap and sink I would go a considerable distance from my microscope room, if necessary. The tap should by all means have a "rose" on its orifice, and I prefer an arm tap *plus* a screw-down valve. An arm tap working by a turn of the arm alone is a very bad arrangement.

A "matchless" burner for gas is a very useful adjunct to a dark-room where gas is laid on. If for nothing else, it will be found very convenient for bromide paper and gelatino-bromide slide printing.

Another very important matter is to have a standard light by which to judge the qualities of our finished negatives. This light should be furnished with an opal or ground-glass globe. A negative cannot be properly estimated by a bare light. I have repeatedly lost time by judging with a bare light negatives developed during the evening. The first, perhaps, was amiss, and the others followed, and next day I found the whole set too weak or too dense. Daylight is the proper light by which to judge, but failing daylight, an opal globe will answer.

(To be continued.)

NOTE.—Mr. Pringle has kindly consented to answer any questions on photo-micrography. Letters should be addressed care of Editor.

## Notes for Novices.

### FOCAL LENGTH.

An important point for practical work is the estimation of the equivalent focus or focal length of a lens; this may for convenience sake be defined as the focus for parallel rays of light. The determination of this point is not only necessary for the determination of the ratio aperture of the diaphragms or stops, which we shall explain hereafter, but it is absolutely essential to know the focal length for many other purposes, which we need not here enter upon.

There are a great many methods, which have been proposed for measuring the focal length; for instance (1) by focussing the sun, and measuring the distance from the lens to the screen; (2) by testing the lens on an optical bench; (3) by comparing the image with that given by a single spectacle lens; (4) by focussing an object the same size, and measuring the distance between the screen and object, and dividing this by four; (5) Grubb's method of marking two lines on the screen, and making the image of a distant object coincide with these lines, and then tracing a line by the side of the camera and making these two lines meet, and marking off on the two lines a distance exactly equal to the distance of the marks on the screen, and finding the distance between the intersection of the lines and the base of the triangle. We dismiss the first method as impracticable, because the sun is not always to be seen to order; the second because few of us possess an optical bench; the third because we have not got a complete series of spectacle lenses; the fourth because some of our cameras will not rack out sufficiently, and because the chance of error is very great; and Grubb's method, because it is not always convenient to find a distant object.

One of the simplest and most accurate methods, or at least one where the chance of error is small, is the following, which requires extremely simple apparatus, no skill, and only the use of a foot rule and a pencil and paper to multiply and divide one or two figures. The camera is placed upon a table, when convenient, or if such is not handy, on the ordinary tripod. We support on a wall, shelf, or convenient place a foot rule which is plainly marked in inches. On the ground-glass of the camera, a space of two inches is accurately marked, as near the centre as possible; it is merely necessary to mark off the two inches, not to divide it out into parts. The camera is now moved backwards or forwards till the image of the foot rule of 12 ins. just falls on the two-inch space we have marked out. The coincidence of the image on the lines should be examined with an eye-piece or compound focuser, to see that they do coincide, then the distance between the foot rule and the focussing should be carefully measured, and this distance jotted down, as from this we obtain the focal length of the lens. This number is multiplied by the figure which represents the proportion of the image to the original object, and the result is then divided by the square of the proportional number plus one. Taking an example, we find that the distance between the foot rule and its image equals 63 inches.

$$\therefore 63 \times 6 = 378;$$

$$378 \div 49 = 7\frac{7}{8} \text{ ins., the required focal length.}$$

It must not be thought that the above proportion between the object and its image is essential; any convenient proportion may be taken, such as 4, 5, 8, etc.; but the rule holds good with all.

There is one point in connection with the measurement of the distance between a lens and an object, and a lens and the focussing screen, which it is as well to note, and that is that the measurements should be from a point which is called the optical centre. In practice, however, this point may be considered to be the slit for diaphragms in doublet lenses, and the actual lens itself in single or landscape lenses.

Having determined the focal length, the next point is to determine the ratio aperture of the stops or diaphragms. This is by no means a difficult matter, and necessitates the use of a foot rule and a little calculation.

### RATIO APERTURE OF STOPS OR DIAPHRAGMS.

We will suppose that we have a doublet lens, the focal length of which we determined, as stated above, to be = 8 ins., and we have a series of six diaphragms, of which we desire to know the ratio aperture; that is, we want to know what ratio the aperture of the diaphragm bears to the focal length. It is only necessary to place the diaphragm on the foot rule, which should

be divided into sixteenths of an inch; read off the diameter of the aperture, and divide the focal length by this diameter, when we obtain the ratio aperture, or what is otherwise called *f/x* value of the stop. Now then the first diaphragm is found to have an aperture of one inch; we may say that this is one-eighth of the focal length, and we call this stop therefore *f/8*. The next stop is nearly three-quarters of an inch, and, this divided into eight, gives us eleven; this stop is then *f/11*. Treating all the other stops in the same way, we obtain *f/16*, *f/22*, *f/32*, and *f/45*. And these values are of importance in calculating exposure, and in their action upon the image transmitted by the lens, a subject we may treat of in another note.

## Notes from the Edinburgh Centre.

(By our District Editor.)

THE railway strike has been a very disturbing element in the history of the Photographic Exhibition, and has turned out to be a great misfortune, as it has cut off visitors during the Christmas holidays. The New Year is, however, the principal attraction in Scotland, and it is to be hoped that the railway service will be in its normal condition before then. I am informed that the loss of patronage during the holiday season is a serious matter to the Exhibition, and that anything like a substantial surplus need not now be looked for from it, but that it will, in all likelihood, pay its way. What more should be wanted? To educate the people in art should be a sufficient return for an exhibition, without making a money profit out of it.

Owing to the railway strike, in case you should not receive them in time, I write my notes earlier than usual. On this (Saturday) night, the awards in the Exhibition have not come out yet. They were in London getting signed, and are now either in Glasgow, or on the way to the Secretary in Edinburgh. After their arrival here they have to be signed by two of the jurors in Edinburgh.

The Exhibition entertainments, since I last wrote, have not been up to their previous standard. On Tuesday night Mr. Alfred A. Murray, M.A., LL.B. Edin., gave a series of lantern slides descriptive of a recent tour to Hamburg, Copenhagen, and Christiania. Mr. Murray's description of the places was interesting, but his slides he apologised for.

On Friday night Mr. H. J. Blanc, the President of the Edinburgh Society, started to deliver a lecture on "The Architecture of Normandy and Brittany," and had just delivered a very prettily-worded introduction and shown his first view when the lantern failed. The Chairman, Mr. G. G. Mitchell, of Edinburgh, explained that one of the gas cylinders had been supplied empty, and it was impossible to go on with the lecture. It was accordingly postponed till Tuesday night. The audience left in not the best of humours, many of them having given up special engagements to be present to hear what would doubtless have been, and will be, when delivered, a great treat. By the way, the lantern has not been very satisfactorily handled at any of the shows in the Exhibition. The lantern is all right, but the handling of it has not been so skilful as might have been desired.

**Lantern Society.**—At the meeting on December 22nd, Lieut. C. E. Gladstone, R.N., read a paper on "Some Architectural Features of Normandy and Brittany." The illustrative slides shown were made by the lecturer from his own 12 by 10 negatives on stripping films, taken during the past summer. The paper was principally intended to illustrate the characteristic marks of the ecclesiastical and domestic architecture of the country, and the differences between the contemporary styles in England and France were pointed out.

**Book Illustrations.**—When "process blocks" for book illustration are good, they are, as the song says, "Very, very good," but the continuation of the lines, "But when they are bad, they are horrid!" correctly describes all except those which are first-class. An important book on the "Palaeozoic Fishes of North America," by Professor Newberry, has just been issued by the United States Government, and the reviewer in *Nature* (December 18th) writes of the illustrations, "There are fifty-three plates, of which, unfortunately, little complimentary can be said. Eight of the latter are inferior process reproductions of plates that have already appeared elsewhere, and many of the others are so carelessly produced by the same photographic method that they give a very imperfect idea of the fossils they are supposed to represent."

## Exhibitions.

**EDINBURGH PHOTOGRAPHIC EXHIBITION AWARDS.**  
THE Council of the Edinburgh Photographic Society met on Monday night, and adjusted the following as the awards in their Exhibition:—

Class I., Landscape.—1, Richard Keene, Derby; 2, C. Digby Jones, Edinburgh; H.M., J. P. Gibson, Hexham.

Class II., Landscape.—1, F. Boissonnas, Geneva; H. P. Robinson, Tunbridge Wells; 2, J. P. Gibson, Hexham; H.M., G. Bruce, Duns.

Class III., Portraits.—1, J. Moffat, Edinburgh; 2, Marshall Wane, Edinburgh; Alex. Ayton, jun., Edinburgh.

Class IV., Portraits.—1, Window and Grove, London; 2, J. G. Tunny and Co., Edinburgh.

Class V., Portraits.—1, William Crooke, Edinburgh; 2, Marshall Wane, Edinburgh; Alex. Ayton, jun., Edinburgh.

Class VI., Figures.—1, J. H. Hogg, Kendal; 2, R. S. Webster, Edinburgh; Ralph W. Robinson, Redhill.

Class VII., Combination Printing.—No awards.

Class VIII., Genre.—1, Lyd Sawyer, Newcastle; 2, J. Terras, Markinch; H.M., A. Diston, Leven.

Class IX., Instantaneous.—1, Charles Reid, Wishaw; 2, Lyd Sawyer, Newcastle.

Class X., Architecture, etc.—1, William Mitchell, Dalkeith; 2, Richard Keene, Derby.

Class XI., Scientific.—A. Pringle, Bexley Heath; C. Piazzi Smyth, LL.D., Clova; Gambier Bolton, F.Z.S., London.

Class XII., Landscape.—1, J. Livingstone, jun., Edinburgh; 2, Dr. Stewart, Edinburgh; T. D. Duncan, Glasgow.

Class XIII., Landscape.—1, J. H. Forbes, Edinburgh; 2, J. K. Taylor, Buxton; H.M., J. E. Austin, Maidstone; R. Kidston, Stirling.

Class XIV., Landscape.—1, J. G. Patterson, Eskbank; 2, W. Mitchell, Dalkeith; Major Rodon, Glencorse.

Class XV., Prize Pictures.—No awards.

Class XVI., Lantern Slides.—1, Geo. W. Wilson and Co., Aberdeen; 2, James Dore, Sandown.

Class XVII., Reproductions.—1, Autotype Co., London; 2, James Patrick, Edinburgh; William Crooke, Edinburgh.

Class XVIII., Vitreous Enamels.—1, H. P. Robinson, Tunbridge Wells; 2, J. G. Tunny and Co., Edinburgh.

Class XIX., Photo-mechanical Prints.—1, Autotype Co., London; Walter L. Colls, London; James C. H. Balmain, Edinburgh; W. J. Annan and Son, Glasgow.

Class XX., Enlargements.

Class XXI., Apparatus.—1, G. Mason and Co., Glasgow; W. Wray, London; J. M. Turnbull, Edinburgh; 2, Wm. Hume, Edinburgh.

The Jurors have not been able to select any one picture of such prominent merit as to justify them recommending it for the Society's gold medal.

**"British Journal Almanack, 1891."**—We have received from the Editor, Mr. J. Traill Taylor, a copy of this most useful and comprehensive volume. The literary matter is of the usual *ollapodrida* order, and is contributed by men of every shade of opinion. Many good things are to be found, but by far the most useful section of the work is to be found in the collection of catalogues of firms supplying photographic materials. The firm not advertising in the "British Journal Almanack" must indeed be of "little reputation," and certainly have not an eye to their own interests. The advertisements are eagerly scanned by amateur and professional alike, and in this respect the "Almanack" is looked upon as a "guide, philosopher, and friend." From a note contributed to its pages by Mr. H. Nelson-King, we find the following analysis of the first "Almanack" published in 1861, and the present (1891) edition:—

	1891.	1861.
Pages of advertisements ... ..	498	44
Number of advertisers ... ..	248	58
Subject matter ... ..	406	62

These facts are encouraging to those like ourselves, who are starting upon an "Annual," and only proves the old adage, "from small things great ones grow."

## Societies' Meetings.

**NOTE.**—In this column the Editor can of necessity only give a brief summary of the proceedings. Papers read before societies will appear in the PHOTOGRAPHIC REPORTER, and the Editor of the REPORTER will be glad to receive reports for insertion as early as possible after the meetings have been held.

**Bath.**—An ordinary meeting was held on December 17th, Mr. W. Pumphrey (President) in the chair. The subject before the meeting was a demonstration of enlarging with Hume's Cantilever apparatus. The Chairman undertook the demonstration, and in the course of his remarks said the tendency was now towards taking photographs of small size, especially quarter-plate, and then increasing the size afterwards as required. The great advantage offered was that they did not require to carry about an apparatus in the field which need embrace anything larger than the quarter-plate. That size he considered exceedingly convenient, and one which, if an enlarged picture were required, would admit of its being done equally as well as a direct picture.

**Birkenhead.**—The annual meeting of this Association was held in the Y.M.C.A. rooms, Grange Road, on the 16th December. There was an exhibition of slides by members, the slides submitted in the annual competition being also exhibited. The awards for the year have been as follows:—Class A, silver medal, for the best set of six pictures, irrespective of subject, for sizes over half-plate, from negatives taken during 1890—H. Wilkinson. Class B, silver medal, for the best set of six pictures, irrespective of subject, for sizes half-plate and under, from negatives taken during 1890—G. A. Carruthers. Class C, bronze medal, for the best set of six instantaneous pictures, irrespective of subject or size, from negatives taken during 1890—H. Wilkinson. Class D, bronze medal, for the best set of six stereoscopic pictures, from negatives, taken during 1890—A. F. Stanistreet. Class E, bronze medal, for the best enlargement, to be made not less than three times the area of negative (a print of the original negative must be attached to the enlargement)—W. Tomkinson. Class F, silver medal and bronze medal, for the best and second best set of four lantern slides, from negatives taken during 1890—1st, G. S. Thompson; 2nd, W. Tomkinson.

**Brixton and Clapham.**—A lantern exhibition was given at the London Hospital on Christmas Day by some members of the Brixton and Clapham Camera Club, the lantern being under the management of Mr. F. W. Levett, the Secretary of the Club. The slides were kindly lent by Mr. A. R. Dresser, the Editors of the AMATEUR PHOTOGRAPHER and the *Magic-Lantern Journal*, Messrs. Thomas and Co., and Mr. Walter Tyler.

**Cardiff.**—An ordinary meeting was held on the 19th December. The President presided. The first professional gentlemen to enrol themselves under the new rules were Mr. R. Forrest (Pontypridd) and Mr. Alfred Freke, of Cardiff. Two ordinary members were also elected, viz., Messrs. Fred Childs and Samuel Luce. Mr. G. H. Wills then passed Wilson's Abbey series of slides through the lantern, after which Mr. Scott, of Weston-super-Mare, proceeded to demonstrate the superiority of his warm-air saturator for lime-light, as compared with the ordinary mixed gases. The improvement was most marked.

**Derby.**—The monthly meeting of the above Society was held on the 23rd December, Mr. Bertwin Cooper presiding. The Chairman called upon Mr. W. T. Tucker, of the Loughborough Society, to give his paper, entitled "My Experience with a Hand-Camera." The lecturer dwelt upon the advantages derived from the use of a hand-camera for obtaining chance pictures, which would be missed by using larger apparatus, and the pleasure gained on a tour by dispensing with weighty and larger cameras. He then described his particular apparatus, and illustrated his remarks by handing round specimens of negatives and prints. A large and interesting collection of slides appertaining to the lecture and the work of Mr. Tucker were thrown on the screen by Mr. J. A. Cope.

**Enfield.**—At a meeting held on December 17th, Mr. Pinkney (President) in the chair, Mr. H. V. Clements was to have read a paper on "Development," but was unavoidably prevented from attending, so the President read it. Mr. Clements thought it important that all development should be carried on by artificial light of a standard illuminating power; by this means it was much easier to judge the exact density acquired than it was possible to do by the ever varying daylight. The method of looking at the back of the plate recommended by some was a very precarious way of judging, as it was, of course, dependent on the thickness of the coating of emulsion on the plate whether the high lights were only barely discernible on the back or very plainly delineated, therefore they should accustom themselves to judge the density of the plate by transmitted light. He advised beginners to select a formula, either one recommended by the maker of the plates they proposed using,

or one they knew some friend was using, and from which they saw he got good results, and then stick to it until it was mastered. Mr. Clements confined himself to two developers, viz., the pyro-ammonia and the hydroquinone, prepared according to Mawson and Swan's formula, and, when developing, started off with a weak solution, and gradually increased it until he got the desired result. He considered that if the plate were flooded with the normal developer at first, unless the plate was correctly exposed, the result must necessarily be faulty, and it was a very difficult task to make it presentable, and if much over-exposed it could not be saved. He would impress upon beginners the importance of having a *safe* ruby light, and of keeping the plate as much in shadow as possible, to prevent that fog for which many developers are blamed, and to see that the plate was covered with the solution free from air bells, but which were easily removed with a camel-hair brush or the finger. He used the latter, as he always knew where to find one in the dark. Mr. Clements contended that over-exposure was preferable to under-exposure, for when one knew how to use the chemicals, the former could be counteracted; but neither chemicals nor knowledge would compensate for the absence of light. He was convinced that slow development was the right thing, for in a quickly developed plate he believed the surface of the film was attacked too energetically at the commencement of the development, and the surface rendered hard and somewhat insoluble or non-porous, preventing to some extent the equable action of the developer at the back of the film, and causing the plate, when in the fixing bath, to lose much of its pluck and gradations, though apparently fully developed. In conclusion, he wished to impress on all beginners the fact that cleanliness was absolutely essential in every branch of photography. A short discussion followed.

**Glasgow.**—In connection with the Glasgow and West of Scotland Amateur Photographic Association, the monthly meeting on the 22nd December took the form of a "popular evening," when there was a large attendance in the Lecture Hall of the Philosophical Institution, the entertainment consisting of a photographic cruise, "Ninety Miles down the Thames from Oxford," illustrated by 200 limelight views, by Messrs. R. H. Elder, John Morrison, jun., and Thomas Taylor.

**Glasgow and West of Scotland.**—At the Glasgow East End Industrial Exhibition, the Society was represented by a large number of frames, some exquisite work being shown. The Exhibition was opened on December 23rd.

**Hastings.**—A very successful meeting was held on the 22nd December. First to occupy attention was the AMATEUR PHOTOGRAPHER Lantern Competition prize slides, which were described by Mr. Gibson. The next series shown on the screen were the slides illustrative of the White Mountains, New Hampshire, lent by the Boston Society. The views, which were described by the Rev. A. B. Cotton, were a very fine series, some being of high excellence. On view in the room were the AMATEUR PHOTOGRAPHER Travelling Studentship pictures, and the views taken at the Society's summer excursion competition were also shown.

**Leith.**—The usual monthly meeting was held on the 23rd December, Mr. William Dougall, President, in the chair. The principal attraction was a lecture delivered by Dr. Hugh Marshall, on the "Platinotype Process," accompanied by a highly successful demonstration.

**Lewisham High Road.**—The ordinary meeting was held on December 19th, Mr. Alfred H. Miles in the chair. A telegram was read from Dr. Dashwood, who was unavoidably prevented from attending to give his promised lantern slide exhibition. A number of slides belonging to the Secretary were shown instead, and after a collection towards the Daguerre tomb repair fund, the members entered on a

long discussion regarding the social meeting and loan exhibition, to be held January 9th.

**North London.**—At the general meeting on December 15th, Mr. A. Mackie in the chair, Mr. L. Medland showed some eikonogen powder which had been kept hermetically sealed in a tin, and yet, upon being opened, was found to have changed to a chocolate colour. Mr. Medland asked if it would still develop without stain. Mr. Mackie thought it would not make any difference in the development. Mr. Coventon said he thought, when the sulphite was mixed with it, it would be all right. Mr. Medland and Mr. Parfitt showed a new frame for fixing lantern slides in contact with whole, half, or quarter plates, so as to cover any piece desired, and to have the picture perfectly straight upon the slide. This was thought to be a very useful piece of apparatus, and is being manufactured and sold by Mr. Adams, of Aldersgate Street. Mr. Glover then submitted a series of questions upon collodio-bromide emulsion, which were answered by the Chairman and Mr. Medland. The Travelling Studentship Prize Pictures, kindly lent by the Editor of the AMATEUR PHOTOGRAPHER, were then passed round, and were very much admired, a number of questions being asked as to developer used and printing processes. An excellent programme has been arranged for the meetings of the society up to July, 1891. The next meeting will be on Tuesday evening, January 6th, when the Secretary will read a paper on "Night Work," with demonstrations in lantern-slide making, copying, enlarging, etc.

**Oxford.**—At the meeting held on the 16th December, an exhibition of the "White Mountains" slides, made by the members of the Boston Camera Club (U.S.A.), was given. A very enjoyable hour and a-half was spent by the 128 present. Some of the slides provoked much applause, particularly the "Fountain," "Wentworth Hall," the waterfall scenes, the "Fisherman," and the "View from Mount Washington." Mr. W. F. Palmer was elected a member. The meeting on January 6th will be a private exhibition of members' slides for members only.

**Sheffield.**—The monthly general meeting of this Society was held on 22nd December, when a lantern demonstration of members' work during the past year was given. Some very beautiful slides were exhibited by the President, Mr. G. T. W. Newsholme, Dr. Morton, Dr. J. A. Manton, and Messrs. J. H. Rawson, B. W. Winder, P. Slater, A. Copley, and G. E. Maleham. An interesting and animated discussion took place on their various merits, methods of production, development, etc.

**West London.**—The meeting on December 12th was a lantern night, Mr. W. A. Brown in the chair. The Chairman referred to the forthcoming amateur exhibition, to be held on the 9th and 10th January. Slides by Messrs. Dixon, Varden, Wilson, Whiting, Chang, J. M. Dicken, Livingstone, and others were then exhibited, the series being concluded with a fine set lent by Mr. Dresser.

**Woolwich and District.**—At the ordinary fortnightly meeting on the 18th inst., Mr. Burnham, B.Sc., gave a very interesting and instructive lecture on "Photographic Chemistry," with experiments, etc., the conclusion of the lecture being postponed till January 1st.

**Worcester.**—At a meeting on the 9th December, Mr. W. A. Firkins in the chair, it was resolved to invite the Mayor (Mr. W. R. Higgs) to become President for the ensuing year. A question from the question-box, as to the effect of exposure of plates and bromide papers to actinic light between the processes of developing and fixing, was discussed, and the members present freely expressed their views upon the subject. A number of enlargements, kindly lent by the AMATEUR PHOTOGRAPHER, were exhibited; also the prize slides kindly lent by *Photography* were shown on the screen, the lantern being worked by Mr. J. Cam.

## To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign

all Queries and Answers with name or *nom de plume*.

4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.

5. The Editor does not undertake to answer questions by post.

6. In answering Queries, correspondents are requested to mention, in every instance, the *number and full title of the query* referred to.

## QUERIES.

4420. **Development.**—How long should an instantaneous photograph on Ilford extra-rapid plate take to develop with pyro and ammonia developer?—**P. G. SCHOLEFIELD.**

4421. **Mounting Prints.**—What is the best solution for fixing Continental photographs in an album?—**P. G. SCHOLEFIELD.**

4422. **Frost on Windows.**—What is the best way to take a negative of this for a lantern slide?

Should the camera be inside or outside the house? About what exposure on ordinary plates, and what stop?—**H. H. W.**

4423. **Camera Adapters.**—I have a 7½ by 5 camera, but wish sometimes to take a whole-plate or a 12 by 10 view. Can any correspondent state his experience with adapters fitted to back of camera? Are they convenient, and do they weigh much?—**ADAPTER.**

4424. **Bromide Paper and Hydroquinone.**—Can anyone tell me whether it is possible to develop Eastman's bromide paper with hydroquinone? I have tried several times, but fail to obtain any results. I carried out the instructions on the paper enclosed in the packet.—**BROMIDE.**

4425. **Reduction.**—What should be the exposure in reducing from 5 by 4 to lantern size, using a wide angle lens, 6 in. focus, working at *f/16*, average light at this time of the year, negatives being fairly dense, using Thomas's, Mawson's, and Fry's lantern plates, and developing with hydroquinone and carbonates? A black tone with full details preferred.—**RHIP.**

4426. **Perfect Brand of Paper.**—Will "Hamish" kindly name the perfect brand of paper he uses?

Also, would he say if a vigorous black tone can be got, and if to be purchased in Leeds?—NIMROD.

4127. **Building Amateur Studio.**—I am building a new workshop, and can spare a portion of the attic room, 22 ft. long, for a studio. Workshop is 16 ft. wide. Will some reader with practical knowledge inform me what skylights and windows will be required, and where they should be placed? Roof slopes north and south.—HERKWARD THE WAKE.

4428. **Combined Enlarging and Optical Lantern.**—Will some one kindly tell me of a good combined enlarging and magic lantern? I should like it to enlarge from  $\frac{1}{4}$  by  $\frac{3}{4}$  up to 15 by 12, the lens and everything included, and to be able to enlarge on to plates if desired, instead of bromide paper, and to do equally well for a magic lantern for home use, or for enlarging purposes, for about £12. Would W. Watson's enlarging lantern answer these requirements satisfactorily? It is £12 10s., including the front lens. Would it be all that is required, or should I have to use my camera with it?—MAHDI.

4429. **Transferotype.**—Will anyone kindly inform me where I can procure transferotype, as Eastman's does not make now?—KENDAL.

## ANSWERS.

4371. **Lenses.**—Swift, Ross, Dallmeyer, Beck, Taylor, Crouch. I consider the first three of equal merit. I have used lots of Swift's lenses, and could not wish for more perfect workmanship. They are a trifle cheaper than Ross's and Dallmeyer's; but from a long experience I am convinced they cannot be surpassed.—VIATOR.

4417. **Stereoscopic Work.**—See Mr. Valentine Blanchard's articles, which have just appeared in the *AMATEUR PHOTOGRAPHER*.—MEMNON.

4418. **Tricycle and Camera.**—One of the Crippler type. A good carrier is given in the "British Journal Almanac" for 1891, p. 618. Cushion tyres are still on trial.—MEMNON.

4419. **Lantern Slides Wanted.**—Try G. W. Wilson and Co., Aberdeen; Wood, Cheapside; Newton, Fleet Street; York and Son, 87, Lancaster Road, Notting Hill. The latter advise specially for foreign ones.—ISIS.

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED: AM: PROT.

**NOTE.**—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.

**JOHN TANNOCK.**—We place in the following order—dry plates, 3, 1, 2; lenses, 2, 1. shutters, 2, 3, 1. THOS BURNELL.—Lenses as follows—1, 3, 2. The stops of the EurySCOPE are exactly the same as the rectilinear, except, as you say,  $\frac{1}{6}$ .

**WALTER L. NASH.**—Mawson's photo-mechanical plates you will find the most suitable, as they are made specially for this purpose.

**MISS L. RIDLEY.**—You may certainly rely upon the firm for anything that they advertise. With regard to your print sent us last week, we find distinct traces of hyppo, which would account for every spot you have yet come across.

**NOTICE.**—The portrait lens is very much quicker, and certainly gives softer and rounder images. You give us no data as to plates and developer. Let us know about these and we will help you, but till you can turn out better work than that sent you had better stick to your present lens. Probably you are wrong in developing.

**REV. H. TUGWELL** (Lagos, W. Africa).—Your note received; we will write you by next mail.

**HOLDBIVEN.**—All the prints would look better if mounted on larger mounts, so as to show at least half an inch of tint. (1) Good, but would have been better if all the cottage had been taken in. (2) Very fair. (3) Fair, spoilt by the pink paper. (4) Very fair. (5) Good, but the church tower is slightly out of perpendicular, due to the camera not being level. (6) Very fair; the expression on girl's face, however, is hardly easy enough to suit her position; she ought to make a good study by herself. We hope soon to welcome you as a competitor and as a prize winner, as the work shows good merit.

**J. A. CARTER.**—(1) Chiddingstone, much too thin. (2) Winter, too thin. (3) Dawlish, the houses are all falling down. How did you get this colour? (4) Merry Christmas, not good. (5) Oattie, fair. (6) Godstone Road, the camera was hardly necessary on the right. You are inclined to get your slides too thin, and the colours of all are not pleasing.

**G. D. (Paris).**—They can both be got from the Sensitised Opal Card Co., Ltd., 18, Alpha Road, London, N.W.

**SUBSCRIBER.**—You will be quite safe in purchasing either lens you name; there is little, if any, difference between them.

**DONALD.**—The camera you mention will answer all the purposes for which you require it.

**T. W. BACON.**—We send you an extract from the reply sent us by the Eastman Company.

**A. HARRISON.**—Your communication has much to commend it; but it is too lengthy for publication. Still, we will take an opportunity of calling attention to your proposals, and lay the letter before two or three influential amateur photographers. Will write you later on.

**CLEMENT J. LEAPER.**—The drawings now sent shall be blocked the same size.

**ALEX. KEIGHLEY.**—Many thanks for letter and good wishes.

**W. CHARLES.**—Pleased to have your letter. The Edinburgh awards are published in this week's *AM: PROT*.

**H. KINDERMANN.**—We intend to arrange to have the prize stereoscopic slides on view, and will announce the date shortly.

**X.**—The question of price is one that is usually settled on the broad basis of supply and demand. We do not care to have the matter discussed in these columns.

**X. Y.**—You have not endorsed your query with name and address, therefore it is not answered.

**PERCY SHEARD.**—The matter has been exposed in other journals, and we fear that we have not much sympathy for those who expect to get a "two guinea life-size portrait free of charge."

**E. B. WAIN.**—Thanks for the lion story, which we regret we cannot utilise, owing to the many calls upon our space.

**F. C. PETERS.**—We will give the subject suggested in your letter early attention.

**F. R. UPOTT.**—No further sales have been effected.

**JOHN POWER.**—We have sent your complaint to the Secretary of the Photographic Manufacturers and Dealers Association, 7, Southampton Row, W.C. They are the proper people to deal with the subject.

**IMPISI.**—Yours is really a too awfully lovely letter; but hardly O. K. to publish. We must try and read it at the next meeting of the members of the "Photo-aesthetic-naturalistic-impressionistic-fuzzigraphic Club" we are invited to attend. Shall be in Ventnor the week after next, hope to call upon you.

**G. W. MACKEY.**—Photographs contributed to the *AMATEUR PHOTOGRAPHER* "Monthly Competitions" must be mounted, not framed.

**J. E. HARDWICH.**—Will write to you.

**J. W.—No;** it is probably a fanciful name from *sol*, the sun, and *grapho*, to write.

**O. V.—In** the following order—C, A, B.

**H. MANNING.**—Decidedly No. 1. The lens is a fixed focus one. The shutter of No. 2 is inferior.

**ACCESSORY.**—Cost the balustrade with rather thick size, and whilst soft and tacky, dust on coarse silver sand, or use a thin glue.

**LOUIS MELDON.**—We do not think you will get what you want without specially preparing it yourself. The quality depends so much upon the manner of salting and sensitising. Do you mean a quick printer, or one giving more contrast, by "brisk"? We do not know what the solutions are, but if you will answer the above question we will write you privately, and give you a new formula for this toning. The platinum salt may be had from almost any photographic dealer, but specially from the Platinotype Company.

**E. L. DELARNE.**—Can you come up some Monday afternoon, between 2 and 5, and bring the camera with you, or else send us the camera with some of your failures, and we will examine it carefully, and then give you our report; fee, 2s. 6d. We can then answer your questions satisfactorily; at present we are utterly at a loss to know where the fault lies. The lens is certainly a good one.

## Sale and Exchange.

**RULES.**—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny Stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

### DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

**N.B.**—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such adver-

tisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

Advertisements can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 6d. to cover postage.

**Cameras.**—Fallowfield's Facile, cost £1 4s., in first-rate condition; take £3, or offers.—No. 89, *AMATEUR PHOTOGRAPHER* office, 1, Creed Lane, London, E.C.

**Cameras, etc.**—Complete apparatus for photography, camera, microscope, etc., on base-board, new; £5.—Burr, Westgate, Gloucester.

**Sands and Hunter** tourist camera, 13 by 18 centimetres, three double backs, waterproof case, tripod; £6. If desired, Eastman roll-holder to fit; £2.—E. P., 34, Upper Baker Street, London.

**Cameras, Lenses, etc.**—Lancaster's Special 1883 camera, brass-bound, 15 by 12, one double back, carriers, 12 by 10, 10 by 8, Le Meritote lens, and tripod to match, all as good as new; lot £10.—D. T. Field, Clent, near Stourbridge.

**J Half-plate camera,** three book backs, in best waterproof case, every possible movement, 70s.; whole-plate French rectilinear, with Taylor's Iris diaphragms, a splendid instrument, £23 10s.; Kershaw shutter, to fit above, 15s.; Optimum half-plate W.A., quite new, 40s.—H. N. Cooper, 54, Chester-gate, Stockport.

**5 by 4, double extension, modern, lens and slide, all movements, 28s.; band camera, automatic changer for 12 quarter-plates, with lens, finder, etc., in perfect order, 42s.—T. Mercer, 16, King Street, Sparkbrook, Birmingham.**

**Developing Tents.**—Marion's square shape, complete with table and sink, cost £4 4s., take £2; Rouch's, complete with tripod, take £2.—No. 89, *AMATEUR PHOTOGRAPHER* office, 1, Creed Lane, London, E.C.

**Enlarging Apparatus.**—Quarter-plate enlarging apparatus; send stamp for description and sketch; price 25s.—Tooth, Stephen Street, Rugby.

**Enlarging Lantern.**—Watson's £6 15s. enlarging lantern,  $\frac{5}{8}$  in. condensers, front lens, 4-wick lamp, perfect condition; £4 5s.—Miss Galloway, Thirkleby Park, Thirsk.

**Hand-Cameras.**—Talmer hand-camera, new last week, perfect order, sell cheap.—Evans, Tannery, Minehead, Somerset.

**Camera, Rouch's** detective, in perfect order, £2 10s., with case; also Newman's shutter, new, 10s.—T. J. O'Connor, 5, South Cr. Road, Dublin.

**Abraham's** hand-camera, Kerr's patent, in good condition, with Wray lens, 5 by 4, open aperture  $\frac{1}{5}$ ; cost nearly £9; will sell for £5 10s.—W. F. Jones, 1, Finsbury Square, E.C.

**Lenses, etc.**—Lancaster's 10 by 8 landscape lens, will take 14s.; Lancaster's wide-angle Rectigraph lens, quarter-plate,  $\frac{3}{4}$  in. focus, will take 23s. 6d., both in excellent condition; 12 lantern slides, Lincoln Cathedral and Gateways, for 10s.; good half-plate set wanted, must be cheap for cash.—Birkbeck, 5, Balgait, Lincoln.

**Sundries.**—"British Photographic Journal," last 4½ years to date, clean, perfect, at 6d. per dozen; also few copies "News" and "Journal" Almanacs, 5d. each.—Hooper, Cumberland Road, Hanwell.

**AMATEUR PHOTOGRAPHER**, Nos. 222 to 288, complete and clean, also eight of the extra issues, 7s. 6d.; "Photography," vol. ii., complete in numbers, 3s.; 12 ft. lantern screen, frame, jets dark-tent, and other articles.—Particulars from H. G. Irwin, 29, Albert Road, Dalston, London, N.E.

**136 numbers of AMATEUR PHOTOGRAPHER**, 11s.; 36 7d. numbers "Our Earth and its Story," 14s. Wanted, Griffiths' guinea detective camera, cash and exchange.—B. Manell, 24, Bilston Street, Wolverhampton.

**AMATEUR PHOTOGRAPHER**, complete to date, eight vols. bound, remainder unbound, sale or exchange. Offers to O. J. Leaper, 4, Chester Road, Dublin.

## WANTED

**Artists' Lay Figure.**—State price, etc., to T. G. Whaithe, Photographer, Carlisle.

**Cameras, etc.**—Whole-plate camera and three slides, Opimus EurySCOPE lens (by Perken, Son, and Rayment), case, and folding tripod, all must be in first-class condition.—Sydney Miller, 23, High-bury Grove, Islington, London.

Useful quarter-plate camera and tripod, must be cheap; approval.—J. Harriman, Henley-on-Thames.

**Enlarging Lantern.**—To hire for a fortnight an enlarging lantern, with or without stand lens not required, condenser must be 8½ in.—Rev. T. G. Vyvyan, Charterhouse, Godalming.

**Hand-Camera.**—Fallowfield's Facile hand-camera, in good condition, cheap.—Graham, Springhill, Bowdon, Manchester.

**Lantern.**—Lantern, must be big enough for Hughes' Pamphengos 3-wick lamp.—Hardwich, Wells, Somerset.

**Set.**—Cheap for cash, half or whole plate apparatus, modern, and in good condition; approval.—W. Stennett, jun., Billingham, Fellingham, Lincolnshire.

## NOTICES AS TO ADDRESS.

**PUBLISHING DEPARTMENT.**—All letters containing Subscriptions, Orders, Remittances, SALE AND EXCHANGE Advertisements, or other business matters for the *Amateur Photographer* are to be addressed to the Publishers, HAZELL, WATSON, AND VINEY, LD., 1, CREED LANE, LUDGATE HILL, LONDON, E.C.

**NOTE.**—SALE AND EXCHANGE Advertisements, at the charge of Three Words for One Penny, can be received as late as WEDNESDAY MORNING.

**ADVERTISEMENT DEPARTMENT.**—All communications respecting TRADE Advertisements in the *Amateur Photographer* are to be addressed to FARRY AND CRAWFORD, 1, CREED LANE, LUDGATE HILL, LONDON, E.C.

**NOTE.**—Trade Advertisements are received up to Tuesday morning.

**EDITORIAL DEPARTMENT.**—All Literary Contributions, Queries and Answers, Photographs for Competition or Criticism, Books or Apparatus for Notice or Review are to be addressed to the Editor, *Amateur Photographer*, 1, Creed Lane, Ludgate Hill, London, E.C.

**NOTE.**—To ensure insertion, all Communications should reach the Editor on Tuesday.

**CORRESPONDENCE SECTION.**—Anyone wishing to communicate with Contributors can do so by forwarding such Communication in stamped envelope under cover to the Editor, *Amateur Photographer*, 1, Creed Lane, Ludgate Hill, London, E.C.

## "AMATEUR PHOTOGRAPHER" MONTHLY PHOTOGRAPHIC COMPETITIONS.

THE PROPRIETORS of the *AMATEUR PHOTOGRAPHER* offer, Monthly, two prizes consisting of a

SILVER AND A BRONZE MEDAL (WITH RIBBON AND CLASP),

for the best and second-best photographs sent in to each of their Monthly Competitions. The subject of the Competitions will be as follows:—

No. 21.—ANIMALS AND INSTANTANEOUS SUBJECTS .....	Feb. 2.
" 22.—SNOW AND HOAR FROST .....	Mar. 2.
" 23.—INLAND SCENERY .....	April 2.

Only one print is to be sent in; the negative of the prize pictures shall be at the service of the Proprietors, and all the prints sent in shall become the property of the Proprietors of the *Am. Phot.*

All photographs for any of the above competitions will be acknowledged in the columns of the *AMATEUR PHOTOGRAPHER*.

All photographs criticised, and several reproduced every month, in the *Photographic Reporter*.

Entry forms on receipt of stamped addressed envelope. Apply to the Editor, *Amateur Photographer*, 1, Creed Lane, Ludgate Hill, London, E.C.

## SPECIAL COMPETITION,

ILLUSTRATING THE

### "SEVEN AGES OF MAN,"

As described in Shakespeare's Play "AS YOU LIKE IT" (Act II, Scene VII.)

FIRST PRIZE .....	GOLD MEDAL.
SECOND " .....	SILVER MEDAL.
THIRD " .....	BRONZE MEDAL.
FOURTH " .....	CERTIFICATE.

**CONDITIONS:**—That the Photographs shall be from life, in the costumes and with the surroundings of ordinary daily life. Photographs in which the subjects have been "got up" will be rejected.

The prints may be by any process. The prize photographs will become the property of the Proprietors of the *AMATEUR PHOTOGRAPHER*, who will have the right to call for the use of the negatives.

All the work must be done by the Competitor. The photographs are to be mounted, and the title, with quotation from the play

neatly written or printed upon the mount. Each photograph is to be numbered in the order of the "Ages."

All contributions must be received on or before Saturday, 31st January, 1891, addressed:—"Seven Ages of Man,"

EDITOR:—*AMATEUR PHOTOGRAPHER*,  
1, Creed Lane, London, E.C.

## "AMATEUR PHOTOGRAPHER" MONTHLY LANTERN SLIDE COMPETITION.

Prizes:

SILVER AND BRONZE MEDAL AND CERTIFICATE.

	Prizes:	LAST DAY.
LANDSCAPE, SEASCAPE, AND RIVER SCENERY ..	First Competition.	Jan. 22nd.
PORTRAITURE AND FIGURE STUDIES ..	Second Competition.	Feb. 19th.
ANIMALS AND INSTANTANEOUS PICTURES ..	Third Competition.	Mar. 19th.
ARCHITECTURE (INTERIOR AND EXTERIOR) ..	Fourth Competition.	April 16th.

The Competitions will be resumed in September.

**CONDITIONS.**—Each competitor must send in two slides. Any competitor winning a Silver Medal will be disqualified from entering the subsequent Monthly Lantern Slide Competitions. The winner of Bronze Medal or Certificate can only compete for the higher prize or prizes in subsequent competitions.

The awards will be published in the *AMATEUR PHOTOGRAPHER*, and a general note given upon each competition.

The slides of competitors which do not gain a prize will be divided into three classes, according to merit, and the competitors' names, etc., published in the *Photographic Reporter*.

All slides entered for competition to become the property of the *AMATEUR PHOTOGRAPHER*.

**NOTE.**—The slides will be passed through the lantern at the Office of the *AMATEUR PHOTOGRAPHER* on the Monday evening in each month immediately after the date upon which the slides have to be received.

Particulars as to admission, and entry forms, may be had by forwarding stamped directed envelope to

THE EDITOR,  
"AMATEUR PHOTOGRAPHER,"  
1, CREED LANE, LONDON, E.C.

## DYSON'S WASHABLE LANTERN SCREENS.

(Should the Screen be soiled it may be sponged clean.)

Price List (including Rollers), Carriage Paid.

Telephone N° 1645

Telegraphic Address: VINEY, LONDON

Offices: 4, Gresham Lane, Ludgate Hill, London, E.C.

VOL. XIII. No. 327.]

FRIDAY, JANUARY 9, 1891.

[PRICE TWOPENCE.

## OUR VIEWS.

"To hold as 'twere the mirror up to nature."—Shakespeare.

[Members of the Editing staff are "At Home" on Monday afternoons from Two till Five o'clock, and they will gladly give advice upon all photographic matters.]

THE Monthly Competition, No. 20, "Portraiture and Figure Study," contains a considerable number of excellent prints, and though there was no difficulty in awarding the first prize, much time was taken up in deciding which print should receive the second.

*First Prize (Silver Medal).* . W. SMEDLEY (Derby).

This competitor's contribution is a print from a 10 by 8 negative, the subject being "My Sister." The picture is the study of a head, taken with a Ross Universal lens,  $f/20$  stop, with an exposure of four seconds in a dull light. The posing and lighting are all that could be desired, the face being beautifully soft, and the purple tone obtained by tungstate toning on Scholzig's matt-surface paper is very suitable. A reproduction of this picture will form the frontispiece to the *Photographic Reporter* for February.

*Second Prize (Bronze Medal)* . . MRS. S. F. CLARKE (Louth).

This lady sends a print from a 7 by 5 negative, the subject being "Au Revoir." The negative is taken on a Beernaert plate, with an R.R. lens, stop  $f/11$ , a two seconds exposure having been given in a good light, the subject being in shadow, and the print on Scholzig's matt-surface paper, toned with borax and gold. The subject is a poetical one, and shows a beautiful girl standing at an open door, holding a rose to her lips, and evidently bidding *au revoir* to a departing but invisible lover.

Amongst the other prints sent in is an excellent portrait of a lady, by Mrs. Benyon (Huntingdon), taken on an Edwards Isochromatic plate, with a Voigtlander lens, printed on silver paper. It is a charming picture. Mr. Gilbert R. Betjemann (London) sends a portrait of "A Professor of the Royal Academy of Music" (Herr. Ad. Schloesser). It is taken on an Ilford ordinary half-plate, with a Beck R. R. lens, stop  $f/11$ , with an exposure of one-eighth of a second out-of-doors. Ilford bromide paper has been used with good effect. Dr. T. Johnston English (London) sends "a study" of a girl in Greek dress, taken on a 10 by 8 Fry's sixty-times plate, with a Ross Universal lens, full aperture, with six seconds exposure in an artist's studio. The print is on matt-surface paper, and is toned by Lyonel Clark's platinum process. The picture is good, and the lighting excellent. Mr. John Seed (Harlesden) sends an Alpha print of a group, "Mrs. Jarley's Wax-work

Show." The negative was taken with a Dallmeyer's R.R. lens, stop  $f/16$ , with one and a-half seconds exposure, in a bright diffused light, on a Pall Mall E.R. plate. The grouping is very fair, and the portraits excellent. Mr. J. C. Oliver (Glasgow) contributes a platinotype print of a child, "Olga," taken on an Edwards Isochromatic plate, with a Ross R.S. lens, stop  $f/8$ , and one second exposure on a cloudy day. The print is very soft, and does credit to the worker.

WE have decided upon starting yet another department, in this case of an educational character, viz., "Examinations in Photography." Each week questions will be set in the columns of the AMATEUR PHOTOGRAPHER, and marks awarded for answers, the best three of which will be published in the issue of fourteen days later. Prizes will be awarded to the three competitors securing the highest number of marks during the period of three months. These examinations are intended to encourage the study of the theory and practice of photography; therefore, authorities upon photographic matters and contributors to the photographic journals will not be allowed to enter the competition.

THE Birkenhead Photographic Association is suspending its ordinary meeting on the 15th inst., for the purpose of enabling the President (Mr. G. E. Thompson) and Miss Thompson to give a reception and soirée. Tea and coffee is to be provided. There will also be music and a lantern exhibition of members' work.

IN the list of the Edinburgh Photographic Exhibition awards supplied to us for our last week's issue, the names of those who won the prizes in Class XX.—Enlargements—were omitted. The silver medal was awarded to Mr. F. H. Worsley Benison, and the bronze medal to Mr. T. G. Whaite.

AT the request of several intending competitors, and owing to the very indifferent weather that we have had, it has been determined to extend the time for sending in prints to "The Seven Ages of Man" Competition until Saturday, the 28th of February.

A CORRESPONDENT writes in regard to the line (from "As You Like It") "Bearded like the pard," that "It appears to be very generally misunderstood. I think it refers to

the ferocious horizontal moustaches worn by soldiers—the pard being the leopard, which has only the cat-like whiskers, as we call them.”

In another column we publish a list of the contributors to the AMATEUR PHOTOGRAPHER “Holidays with the Camera” Competition. The following is an analysis of the entries:—

Class I.,	“Niepee,”	or Progressive Gold Medal.	One.
“ II.,	“	“	Silver “ ..None.
“ III.,	“	“	Bronze “ ..Two.
“ IV.,	AMATEUR PHOTOGRAPHER	Gold	“ ..Seven.
“ V.,	“	“	Silver “ ..Fourteen.
“ VI.,	“	“	Bronze “ ..Twenty.

In all we have forty-four competitors, and are sure that the selection which we shall publish will be of very considerable interest. The photographs are all interesting, and the members’ account of the holidays will provide excellent reading matter in “Holidays with the Camera.”

THE Ventnor and Bonchurch Photographic Exhibition will open on Monday, the 19th inst. We understand from Mr. W. Hoskin, the energetic Hon. Secretary, that the exhibition promises to be very successful. The judges are to be Dr. Lord, the Hon. Secretary of the Southsea Amateur Photographic Society, Mr. T. M. Brownrigg, of Guildford, and Mr. J. Fielder, of Chichester. The AMATEUR PHOTOGRAPHER 1890 Prize Lantern Slides will be shown on the evening of the 19th in the Assembly Rooms, Mr. Charles W. Hastings acting as demonstrator.

THE coincidences of thought in journalistic work are often strange. The Editor of the *Practical Photographer* draws our attention to the fact that he has arranged to publish Burnet’s third Essay, “The Education of the Eye,” reproducing the illustrations. So that, as he says, in the present year those who cannot afford the expensive edition with its valuable plates, will have the opportunity of obtaining the whole of John Burnet’s works in serial form.

MANY of our readers will be concerned to hear of the decease of Mr. William Adcock, of Melton Mowbray. This gentleman was one of the earliest supporters of this journal, and received a second prize, a Silver Medal, in connection with the first “Home Portraiture” Competition in 1886. He was a constant contributor to the correspondence columns. He was also an early member of the Camera Club, and we find he read the first paper, “Sitting-room Portraiture,” of importance contributed by any member of the Club; certainly it was the first reported, and will be found in the *Am: Phot: vol. iii.*, No. 72, February 19th, 1886. At that time Mr. Adcock was “a practical and successful worker in figure subjects, taken at home, and his large direct portraits were known to most frequenters of photographic exhibitions;” so wrote the Editor of this paper. Mr. Adcock was a most genial and courteous gentleman, and one who was ever ready to assist either professional or amateur photographers. He died at the ripe age of 69, and was, we understand, up to the day of his death, an enthusiastic worker in photography.

THE last day for receiving applications for space at the Liverpool, 1891, Photographic Exhibition has been fixed, viz., the 20th inst. We understand that the Exhibition will be an immense success, and that all the members of the Liverpool Society are most enthusiastic. In another column, Mr. T. S. Mayne, the Hon. Secretary of the

Exhibition Committee, replies to the letter published last week from “A Possible Exhibitor.”

WE are pleased to note that one result of the recent *free* exhibition of photographs at Louth has been the election of no less than twelve new members of the Louth and District Photographic Society.

THE following short note upon the life and work of the author of “Burnet’s Essays” will be read with much interest at the present time:—

“John Burnet was born at Musselburgh, near Edinburgh, on March 20th, 1784. His first art principles were received from Mr. Leeshman, the master of Sir Walter Scott, and he was apprenticed to Robert Scott, an engraver, whom he served the then usual time of seven years, learning the practical part of etching and engraving. He attended during his apprenticeship the daily classes of John Graham at the Trustees’ Academy, where, with David Wilkie and William Allan, he studied painting.

“In 1806, induced by the success and fame of his fellow-student, Wilkie, he visited London, and thus Burnet describes his arrival in London: ‘Wilkie having preceded me by twelve months, the fame created by his picture of the “Village Politicians” produced such a sensation in Scotland, that I hastily finished my engraving and set sail for London in a Leith smack. On my arrival at Miller’s Wharf, I seemed to feel—what most Scotchmen feel—“ample room and verge enough,” and though with only a few shillings in my pocket, and a single impression from one of my plates for Cooke’s “Novelists,” I felt myself in my proper element, having all that confidence peculiar, I believe, to my countrymen. I went instinctively towards Somers Town, where many of my brother artists resided, and next morning to No. 10, Sol’s Row, Hampstead Road, to call on Wilkie. He was delighted to see me, and exclaimed, “I am glad you are come, for London is the proper place for artists.” On his easel was the picture of the “Blind Fiddler,” which struck me as a wonderful work for one who had seen so little of such paintings in his youth. My first engravings after settling in London were for Cooke’s “Novelists” Britton and Bayley’s “England and Wales,” Mrs. Inchbald’s “British Theatre,” etc., but I longed for some larger work upon which to employ my graver, and bespoke the engraving of the “Jew’s Harp,” of the same size as the painting.’

“The success of this engraving led to a rapid and masterly series of engravings from Wilkie’s pictures, which even now are well known and sought after. After the peace of 1813, he went to Paris, studying and copying in the Louvre for five months. He then returned to London, and joined the association of engravers (brought together by Mr. Sheepshanks) who illustrated a series of pictures in the National Gallery.

“Burnet confined himself not alone to engraving, but was as well a painter of no mean merit; but he himself said, in speaking of his early training, ‘I have often thought that my following the profession of an engraver and painter at the same time, cramped the greater extension of either, as both are of sufficient difficulty to require the undivided attention to arrive at a high degree of excellence.’ His most famous paintings are ‘The Greenwich Pensioners,’ a companion picture to Wilkie’s ‘Chelsea Pensioners,’ ‘The Draught Players,’ ‘The Humorous Ballads,’ and ‘A Windy Day.’

“His great fame, however, rests on the foundation of his writings on art. His first treatise, ‘A Practical Treatise on Painting,’ in 1827, was followed by ‘An Essay on the Education of the Eye,’ 1837, ‘Practical Hints on Light and Shade,’ 1838, ‘On Colour in Painting,’ in 1843, ‘Rembrandt and his Works,’ in 1849, ‘Turner and his Works,’ in 1852, and many others.

“In 1836 he gave valuable evidence before a select Committee of the House of Commons, on arts and manufactures, and as a writer on art he achieved, and still maintains, a deserved reputation. His thorough knowledge of his profession, both as engraver and painter, and his sound and sober judgment, give his writings a value often wanting to those of more brilliant authors” (“Dict. Nat. Biography”).

In 1860 he received a pension from the Civil List, and retired to Stoke Newington, where, like many of his fellow artists, he passed in straitened circumstances the last years of his life, dying in April, 1868, *at etat* 84.

## THE CAMERA CLUB.

WITH the beginning of the new year the Camera Club enters upon a new lease of existence, for, with its additional articles conferring upon the company enlarged powers, has come a considerable augmentation of the members' list, and now the Club is taking possession of the handsome and commodious building which has been erected for it in the Charing Cross Road. Most decidedly, therefore, the officers and committee who have guided the destiny of the Club to its present flourishing condition deserve complimenting on the successful outcome of their labours, and the members are to be congratulated on obtaining in so central a position the largely increased conveniences which their new home will afford them.

As certain features in the history of this Club—which is the outcome of a correspondence and suggestions communicated to this paper by various enthusiastic amateur photographers in the months of April and May, 1885—may be of interest to some of our readers, we propose referring to a few details in connection therewith, but before doing so it may not be considered out of place if we enumerate some of the enlarged facilities, both in the social and photographic departments, which the new Club-house will afford. As this building is probably the first of its kind which has ever been built, a certain interest must of necessity attach thereto. We feel justified in calling it a pioneer edifice, for although amateur photographers are to be found united together in societies and clubs in nearly all the large towns of the world, we have not heard that any Society elsewhere has possessed a roll of members sufficiently large, or a banking account that has justified them in erecting and furnishing a house expressly adapted for their necessities. The Society of Amateur Photographers of New York are very comfortably domiciled, as we described in a leading article upon "New York Photographic Societies," in our issue of October 3rd, 1890, but they are confined to one room, which, although it is an exceptionally extensive one, and is ingeniously adapted to supply all the photographic requirements of the members, yet lacks of necessity all the social attributes of a club, for no room could possibly be supplied wherein the wants of members in this direction could be catered for. Hence the London Camera Club is the first of which we have any knowledge where the two elements are united in a successful manner, and who now own a building with suitable accommodation. From this, as well as from other points of view, the actions of the Camera Club must have a certain interest for all photographic social circles, and we have therefore no apology to make for referring to matters which under the ordinary circumstance attaching to clubs in general, might be considered by the members as being of an exclusive character, affecting them alone, and therefore outside the domain of public concern.

The new building, which, as before-mentioned, is situated in the Charing Cross Road, on the same side and within a few doors of the Garrick Theatre, has an imposing exterior, for it is five stories high, is built of brick and red stone, with numerous carved decorations, and is well lighted by large plate windows. The ground-floor, excluding that portion of it forming the entrance hall and porters' lodge of the Club, from which a dividing wall separates it, has been made into a shop of good proportions, for it was the part least required by the Club, and the site, being an exceptionally good one, its rental will form an item not to be despised in the revenue account.

The basement has been utilised by erecting therein nine separate dark-rooms (to which we shall again refer), a photographic work-room for general purposes of fair dimensions, and in addition to these conveniences a large number of

roomy lockers are to be fitted up in this part of the building, which will be let to those members who may wish to have the use of one of these private storing places for a moderate and nominal fee.

On the first floor a large and handsome room is now being fitted up, which, under every-day circumstances, will form the smoking or general assembly room of the club, but it is being so arranged that with very little trouble it can readily be converted into a lecture hall capable of accommodating a very large percentage of the members, a convenience which will no doubt be highly appreciated by the numerous frequenters of those special "Thursday evenings" which have given the Camera Club a considerable amount of its deserved popularity. A feature of this room will be the admirable facilities it will afford for lantern entertainments, for it is lofty, and a portion of the wall is being specially prepared to act as a screen, an arrangement which cannot be surpassed in its suitability for showing up the beauties of a picture thrown upon it by the projecting lantern. In addition to this, we are given to understand that it is the intention of the Committee who have charge of these arrangements to obtain a lantern that shall be an exceptionally good one.

On the floors above are to be found a dining-room, large billiard-room, a cosy and snug library, committee and secretary's rooms, and, in addition to the kitchen, still-rooms, and servants' offices, a well-lighted workshop for the mechanical division of the Club is now being fitted up. On the top of the building a photographic studio, with two more dark-rooms, which any London photographer might envy, are now being suitably furnished. Here also are enlarging rooms, and the requisite appliances for nearly every branch of photographic work are to be supplied as soon as the building is completely finished.

The dark-rooms are models of perfection, for, of course, they possess the advantage of having been designed with a view to supplying members with perfect comfort and all the necessary conveniences. The ventilation of the whole Club, and especially of the dark-rooms, has been carried out in a most successful manner on strictly scientific principles. In the supply of water, the regulation of light, and other necessary attributes of perfect dark-rooms, the members of the Camera Club will not possibly have in the future any cause of complaint.

We have enumerated the conveniences and comforts which the new building is destined to confer upon the members of the Camera Club, in order to draw attention to the success which has attended the movement which a few of our contributors first inaugurated some five and a-half years ago; and as we think that some facts in connection with the starting of the Camera Club and its subsequent career, which will show, step by step, its upward rise, may not be devoid of interest, we purpose continuing our remarks thereon in our future issue.

## Negatives and Positives.

THERE is one point which seems to take almost a lifetime for some people to learn, viz., that an unsuitable background will spoil the best portrait. The great tendency with the amateur portraitist is to have a background far too pronounced in character. A blank wall is better than, say, a brick-lined or ivy-clad wall. In backgrounds, simplicity is the greatest and rarest virtue.

It would be interesting to know how the advocates of fuzzy pictures, who say that we all see things with fuzzy edges, explain away the almost universally

known fact that those people who use spectacles, etc., use them because by such aid they see things clearer. If then a long or short sighted person uses glasses in order that he may see nature more clearly, how can it be naturalistic to present to him fuzziified nature when he uses glasses to remove that fuzziness?

A NOVEL use of photography has been brought to notice in America. A camera-shot is taken at each voter in an election, at the moment of his boxing his ballot return. In this way any duplicating by the same person is rendered practically impossible.

It is now about time to hear again of the old gas—or water—inspector burgling trick. It would cost the gas or water company but a mere trifle to supply every householder customer with a good Woodburytype portrait of the only accredited inspector, taken in his inspecting uniform. This would render the impostor's trick, if not impossible, at least hardly worth the risk of attempting.

It is stated that Lord Saville has been appointed a trustee of the National Gallery in place of the late Sir R. Wallace.

The Académie des Beaux-Arts has appointed Prince Czartoriski, of Cracow, to the chair rendered vacant by the death of Sir Richard. The Prince's competitors were Sir P. Cunliffe-Owen and Signor Gaetano Milanesi, of Florence.

AUNT BELINDA wants to know if Bacteriology has anything to do with double backs. She would also like to know if there is any advantage in using a roller-slide in photographing *rinks* (or wrinkles)?

WHEN Mr. Scott's process for photography in natural colours is perfected (*vide* AMATEUR PHOTOGRAPHER, January 2nd), probably he will suddenly find greatness thrust upon him. The question arises, what is to become of the old original "*great Scott*"?

## Letters to the Editor.

### ALBUMS FOR ARISTOTYPE (AND OTHER) PRINTS.

SIR,—May I remark that some two months ago, having a number of Kodaks to be mounted (a kind of work I much objected to), I called on Mr. Werge, of Berners Street, and asked him to get me cardboards cut (with holes) of different shades—say two boards, four holes in each, and so make eight when glued together. Thinner strips of board are first inserted. As a result—although perhaps a trifle more expensive—much time and *foreign* language is economised; for no other mounting is required than simply passing through the ends—left open—the prints.

The boards should not be square, but oblong, for convenience in binding.—Yours faithfully,  
ITINERANT CORKEY.

January 6th, 1891.

SIR,—The letter from your correspondent, Mr. Louis Meldon, published in your last issue, touches a want which I am sure must be widely felt, as, notwithstanding the present rage for matt-surface productions, I am a great admirer of glazed surface Aristotype prints. The difficulty of being unable suitably to preserve them, however, is in my own case such a serious obstacle that, as a matter of fact, I comparatively seldom adopt this beautiful process, which would become a favourite one with me if albums to hold the prints with only their paper backing, such as your correspondent suggests, could be procured. Hoping that some of our enterprising dealers will take the hint, and by

providing what is so much needed give a new impetus to the working of the Aristotype and similar printing processes, I am, yours truly,  
ÆOLUS.

January 3rd, 1891.

SIR,—I was pleased to see Mr. Louis Meldon's suggestion in last week's AMATEUR PHOTOGRAPHER that an album, constructed as a portrait album, should be placed on the market for landscape views. I myself have felt a need for such an album, as the ordinary scrap albums are by no means satisfactory; the views cannot be rearranged, and frequently vary in size, thus making a page of four or more look more or less unsymmetrical.

I suggested this to a manufacturer only this week; but he said he did not think there would be much demand. I feel sure there would, and perhaps some manufacturer may intimate through your columns his intention of taking them up.

With the new thick Celerotype paper, mounting would be unnecessary, and a lot of bother saved.

Awaiting its advent, I am, yours, etc.,

NOMAD.

January 3rd, 1891.

### HAND-CAMERAS AT THE VENTNOR EXHIBITION.

SIR,—Having practised photography for about thirty-five years, as an amateur, and taking great interest in the approaching exhibition here, I venture to ask your permission to suggest to manufacturers that they should make a special show of hand-cameras. The time is at hand when photographers will have to decide what field apparatus they will get in readiness for the ensuing spring campaign. I am sure that many an amateur would go in for a hand-camera if he could see a few instruments as examples and compare their merits together. Our journey between this and London is not an easy one, and we have not time, when in town, to visit the show-rooms of several makers.—Yours obediently,  
JOHN G. LIVESAY.

Ventnor, January 3rd, 1891.

### PHOTOGRAPHIC TONALITY.

SIR,—I have read with much interest the article by Mr. Buck in your last issue. To my mind, one great essential of good picture making is a proper gradation in the view itself, which, being very often exaggerated by the lens, requires a development that will *tone down* this exaggeration instead of adding to it. The very morning before reading the article referred to I was at work upon a negative taken by a friend, and which had been developed by the old method. The subject consisted of a striking and somewhat dark foreground, viz., a bold bluff, overlooking a bay, with chalk cliffs in the distance. The latter, as well as the sky and sea, were far too dense by the time the foreground was fit for printing. By just reversing the system of development, and giving only just enough exposure, I succeeded in taking a transparency, and from that another negative, in which the gradations are much more correct, and a better print will result. But how much simpler to have done this in the first instance. I now put down many failures in the past to wrong instructions in this matter. The best subjects are usually those in which there is a wide range of gradation. As I have already said, why seek to ruin this by the old practice of plenty of pyro and alkali by degrees? Rather use very little of the reducer at first, plenty of alkali, and when details are out, add pyro till density is sufficient. But of course you must not greatly over-expose, and many well-known authorities agree that only really first-class results are got where the exposure is just sufficient.—Yours, etc.,

January 3rd, 1891.

Shade and Co.—Mr. Fred. Knole, 12, Hyde Vale, Greenwich, advises us that there is still a vacancy for a member in this Postal Club.

## Studies in Art for Photographers.

BY REV. F. C. LAMBERT, M.A.

### INTRODUCTORY.

THE love of the beautiful seems to be an instinct more or less universal in mankind, although what constitutes beauty in the eyes of one man (or race) often has no charm for others. Few of the many who "like what they like" seldom stop to ask (much less answer) the question, why do they prefer this to that? Now, although the "why and wherefore" of our likes and dislikes involve us in problems many and intricate, often enough terribly baffling too, yet any information which throws even a dim light upon these matters cannot fail to interest those who take a real pleasure in looking upon beautiful things.

The love of "pretty pictures" is a landmark in the childhood of us all, and as children we know not and care not why they are "pretty." But presently, when the time comes, as it does to nearly all children, for us to try to make pictures, then we wonder why we cannot make them as readily as we can call up the wish to do so. A thousand things conspire to lead us away from picture making; but still there remains the old capacity for taking pleasure in looking at pictures.

Again, the calling of one who makes pictures, we presently learn, is one requiring a long, long round of drawing schools, studios, and academies; and at the end of all that, only a very slim chance of "making it pay." Thus for the most part, the ninety and nine have gone their several ways, saying "picture making is not for me."

Here and there one whose love for pictures was perhaps stronger than his love for cricket or football would cheerfully point pencils and "learn to draw a straight line" only very soon to learn that that hobgoblin was as needless as it was out of the reach of human hands. Then came a period of "shading from the east" with much misguided and unprofitable labour, interspersed with the making of bread pills for the stippling department—all tending to final disgust, until "one fine day," lo! a magic box catches the sun's rays and puts them on paper. In a moment we see all the delicacy of curve and fold exactly caught with a precision which outstrips in its exactness the very badness of our hitherto profitless toil, and with this comes back the old longing to *make pictures*.

Modern photography has put into our hands one of the most wonderful powers that the mind can conceive. Of this there can be no question. But there *is* a question of the utmost importance which stares in the face everyone who possesses a camera, viz., how can this magic instrument be used to the best advantage?

The power of delineating form, which is given us by this magic instrument, is, like all great powers, one which requires and deserves the very greatest care in its employment. The evidences of its misuse, abuse, or thoughtless use are abundantly familiar to us all. Nor is the reason for this unsatisfactory state of affairs far to seek. With the majority there has been little or no opportunity of *studying* pictorial art. Nay, further, with many it is a subject which they think requires no study, and, therefore, they set to work under the impression that as "the camera does all the drawing," all they need do is to take any and every object or landscape indiscriminately, and the result is entirely a question of luck as to whether it turns out a satisfactory picture or the reverse. Presently a very disagreeable feeling creeps up which compels the question, "Why are so many of my shots failures, and why are so many of Studymore's such nice pictures? How does he do it? We have the same camera, lens, plates, and go to the same

place. I don't like to copy his pictures, but I certainly should like to know how he makes pictures, where I make failures."

To any such enquirer I make bold to say, that without professing to show him how to attain success, yet I can, in the words of a master, point him to the road which has been trodden by those who have plodded on to success.

Professor Ruskin says, "Painting, with all its technicalities, difficulties, and peculiar ends, is nothing but a noble and expressive language, invaluable as the vehicle of thought." Also, in another pregnant passage, he says, "Painting and sculpture, no less than language or than reasoning, have grammar and method—they permit a recognisable distinction between scholarship and ignorance, and enforce a constant distinction between right and wrong."

The bearings of these observations or quotations, I may say with Cap'n Cuttle, "lays in the application of 'em." And the special points to be noticed at the outset are—(1) That art is a *language* for the expression of thought; (2) That the art language has a *grammar* and *method*. The first step, then, for the explorer in art-land is to learn something of art language, in order that he may hold converse with the inhabitants of that land.

It is the study and application of the grammar of art that is proposed in this course of articles.

At the outset, however, we hear distant murmurings against anything like rules in art. It is the old story retold again and again (*sic*).

STUDENS: "Why should I be at the trouble of learning all these rules and canons when all great artists break them constantly? Answer me that, Prof. Lex.

PROF. LEX. Firstly, I would remind you that those you denominate as *great* have attained their greatness by following these despised rules. *When you become great* you may break them, not before.

STUDENS. But why call it a *law* when it is not of universal application?

PROF. LEX. Why talk of the law of gravitation when every beat of your heart lifts the current of life blood upwards instead of downwards, and every daisy that lifts its face towards the sun and away from the earth, breaks your so-called law of gravity?

STUDENS. The cases are different. One law supersedes another. The sun's light is stronger than gravity—on the daisy, for instance.

PROF. LEX. And why may not this be so in art life? A law is but a concentrated expression of the general agreement of a certain set of similar phenomena. A law *explains* nothing. The law of gravity no more explains gravity than it explains why the architecture of ice crystals is more beautiful than, say, the architecture of Fleet Street or the Strand.

Laws of art procedure are a concentrated essence of the wisdom and experience of those who painted beautiful pictures and cut beautiful statuary, etc. They are for us the hedge-rows which somewhat limit our wanderings to the right and left. As we travel along the broad road, Dame Nature indulgently allows us to stray into the adjoining meadows now and again, through a gate or a gap, but he who would be wise in his generation, who wishes to penetrate into the very heart of the longed-for art-land, will not spend too much time peeping through every gap in the hedge. Experience will show him that time is *not always* saved by making short cuts 'cross country, over hedge and ditch. It is not unlikely that these detours may land him in a bed of nettles, or a holly bush bristling with pin points. The main road is surely wide enough for us all, and it is only he who is top heavy with a burden of enthusiastic

eccentricity, greater than his experience or strength can carry, who will reel to and fro. But says the ready-made genius, "Law was made for slaves," to which one may well reply, hedges, high and prickly, were made for incorrigible vagrants—and cattle. The average pedestrian has no objection to the "quick-set," because he finds room enough and to spare between that on the right and on the left. He who keeps the law knows no law.

Well, then, the road which leads us into art-land is broad, wide enough for us all without jostling or treading upon each other's toes. There are hedges on either side, with finger posts to guide and help the traveller. The road branches here and there, so that there is offered us a choice of courses. These in turn bifurcate and ramify; when we get further and further into the untrodden district, it becomes needful for each one to pick his own way slowly, cautiously, and surely.

How then may we, who have but little time at most to spare, best set about learning the language of art? The old way of learning language was to spend all the elasticity of youth grinding away at rules and exceptions, and exceptions to these exceptions, and so on *ad infinitum* and also *ad nauseam*. So much time was consumed in laying the cloth that we got no dinner; we knew nothing of the language except a lifeless grammatical skeleton. Experience has shown that it is more expedient to modify the older processes. Nor is there any apparent reason why we should not profit by the experience of others, and modify our course of art-language study. What is herein proposed is somewhat as follows:—

(1) To quickly and briefly run through the outline rules, or rather to explain the meanings of common terms used in art composition, to get some outline ideas as to the names and uses of the various devices in picture making.

(2) To turn to the pages of our standard authors, and see what words and phrases they use in their art-language; *i.e.*, to examine a number of well-known pictures in our public galleries (National Gallery, South Kensington, etc.); to take these pictures to pieces, and see, as far as we can, the plan and method followed in building them up.

(3) To gather up the various strings of our mental notes made by the way. To try and form some general idea as to the various effects and results obtained by the several users of the different devices.

But throughout the whole course always keeping one eye open, that we may be storing up hints and experiences for camera work.

It may be as well to anticipate one time-honoured but threadbare objection, *viz.*, that the analysis of a work of beauty destroys its beauty. This dogma has always been to me a complete puzzle, so utterly opposed is it to personal experience and reasoning. When I examine a daisy, for instance, and find it a colony of florets each in itself a little system of great beauty; when I cut sections of its petals, its cells, and tissues, each further revelation is an addition—not a subtraction. Again, sunlight decomposed by a prism into a band of melting tints cedes nothing of its beauty because we learn that there are wave-lengths, vibrations, interference, dispersion, etc. To see a beautiful sunset, and know that some of the gorgeous tints are in part due to carbon in the air—London fog, may be—does not prevent my enjoying its beauty. This enjoyment of its beauty may not, perhaps, depend on that or other knowledge, but certainly that knowledge in no way takes aught away, but rather adds a mental pleasure to the enjoyment.

In short, it seems that one may enjoy things in two ways. As a cat loves the fireside and knows naught of carbon dioxide, nor cares for potential energy, or "heat as mode of molecular motion," so a man may enjoy the beautiful form

and tint of a rose-bud, and know nothing of its embryonic form, care naught that its colour is due to a form of chlorophyll, that there is purpose in its structure, and that its petals, stamens, etc., are only modified leaves, etc.; but this further knowledge only adds to his pleasure in satisfying, in part at least, that instinct or craving which is not the most contemptible of his innate qualities, *viz.*, a desire to know the plan and purpose of the world, of which he is a part. It is often said that art is wholly sensuous; but falsely so said. With many the sensuous is the only side sought or seen, but true art, like true poetry, has within it something which not only satisfies the senses, but also the diviner part of man, *viz.*, his mind.

(To be continued.)

## Instantaneous Photography.

By W. JEROME HARRISON, F.G.S.

### CHAPTER X.

THE SENSITIVE PLATE UPON WHICH THE IMAGE IS TO BE IMPRESSED BY LIGHT.

*Material Used as a Support. (Continued.)*

*Miscellaneous Supports.*—In 1855 Scott-Archer, the inventor of the collodion process, patented a method of coating glass with a layer of colourless gutta-percha. This was then coated with collodion, and a negative produced in the usual way. Another layer of gutta-percha was then poured on top of the dried collodion, and, finally, the whole was stripped from the glass. Thus the layer of collodion which contained the developed picture was enclosed between two (waterproof) layers of clear transparent material. Archer's object in devising this method was to save the cost and weight of the quantity of plate-glass otherwise needed. This method was not a success—commercially, at any rate—but it doubtless suggested ideas to later workers.

We often hear, in the past, of a "tissue" as forming a "support." The term was first applied by M. Leon Warnerke in 1869 to a material which he placed on the market in 1875. It consisted of "nine consecutive coatings" of collodion and india-rubber applied to the surface of very fine tissue-paper (whence the name). The transparent film thus formed could be "detached with the greatest ease" from the paper, which (like the glass in Scott-Archer's method) was used only as a temporary support.

In 1871 M. Warnerke invented a roller-slide to carry his "tissue," and he brought out improved forms of each in 1885; but, from the cost and other considerations, these did not achieve a commercial success.

The "Froedmann Film" (so named from its inventor, a Dublin chemist) was brought out by M. Vergara, in 1887, as a better thing than the "transparent paper" of Woodbury which had been previously sold as the "Vergara Film." The "Vergara Film, No. 2" consisted of gelatine which had been rendered insoluble by mixing with it some bichromate of potash, and then exposing it to sunlight. The bichromate gave a yellow hue to the gelatine; but this was removed by soaking in sulphurous acid. It was found, however, that the film yellowed again with time, and its manufacture was discontinued in 1889.

*The Two Principal "Supports" now in Use.*—For practical purposes we may say that only two materials are now used as "supports" for the sensitive salts of silver employed in producing photographic negatives. These two materials are glass and celluloid.

Of celluloid there are two varieties—(1) *Cut celluloid*, thick enough to hold itself out as a flat surface when held in the hand, and which is used in dark-slides exactly like glass plates; (2) *Rollable celluloid*, so thin that it is as limp as a bit of thin silk, and can be wound upon a spool or roller.

Which of these forms of "support" to adopt, is one of the great questions in practical instantaneous photography. With either glass plates or cut celluloid we use dark-slides at the back of the camera to contain them. The rollable celluloid is, of course, used in a roll-holder.

*Glass for Home Use; Celluloid for the Tourist.*—The heading of this paragraph expresses briefly our present convictions as to the "support" to be employed. When working within easy reach of a dark-room and a developing-room, we consider glass plates to afford the best results.

But if we were travelling, climbing Hecla's volcanic pile, hunting for the Burman tied to the stake, stalking the wild elephant in Ceylon, or emulating our regretted friend Donkin's feats in the frosty Caucasus—then commend us to the light and unbreakable celluloid.

There is something very pleasant in the rigidity of glass which renders its manipulation easy when developing.

Cut films of stout celluloid may advantageously replace glass in the case of long walks, where weight is an object, even near home. But test your celluloid films carefully before relying on them for an important series of negatives. The manufacture of coated celluloid films is as yet in its infancy; and, although wonderful progress has been made, and some makers appear to have even mastered all the new difficulties presented by the new material, yet every new batch should be carefully tested before reliance is placed upon it. *Spots* of various sizes and forms constitute the most common defect of celluloid films; but streaks and lines are also not uncommon. In the small sizes we find the stout films to lie as well as glass plates on the rabbit of the dark slides; but it is better to place a sheet of thin cardboard behind each film in order to take off the pressure of the spring which is usually attached to the partition of the dark slide, and which may cause the celluloid film (if unprotected) to bulge out in the middle.

The thin or "rollable" celluloid film is a wonderful production, and is the "tourist's support" *par excellence*. It is much better, however, when—as is usually the case *en tour*—a long series of negatives is to be taken, and the whole roll used before developing any individual negative. Each time that a piece is cut out of the roll—in order that a single negative may be developed—a portion of the roll is wasted in attaching it afresh to the spool or roller. If it be required to develop some single negative in a hurry, it is, again, not an easy task to select the right one out of the forty or fifty exposures which may have been made upon the long, continuous band of material.

On the whole, we strongly recommend the average worker in photography to use *both* glass and celluloid. Have a roll-holder fitted to the back of your camera; but do not discard your dark-slides. Use glass plates (or cut celluloid film) for work at or near home. Employ the roll-holder when travelling. We frequently carry both dark-slides and roll-holder; keeping the latter as a reserve force in case of need. Who is there who has not lost good subjects "for fear that the plates would not hold out?" With a reserve band of celluloid, sufficient for scores of exposures, in our knapsack, we feel safe on this score. And let it be remembered that the element of *chance* enters so largely into instantaneous photography—at least as compared with ordinary tripod work—that (other things being equal) the successes bear some proportion to the number of exposures made. When a "hand-camera man" comes across a really good

thing in his line, he will do well to make two, if not three, exposures upon it. For this reason he ought to carry a larger reserve of material than the "tripod man" needs to do.

(To be continued.)

## Photographic References.

BY MAJOR J. FORTUNÉ NOTT.

### FOCUSSING.

(Continued from page 436, vol. vii.)

It must be thoroughly recognised by the beginner when first he commences taking photographs that he can make or mar his picture at the very outset by the way in which he focusses. It is therefore necessary to give the matter careful study, and not to be satisfied until he feels he has done the best with the subject that his capabilities will permit. So as to be assured upon this head, the following points should claim his attention, in the sequence given herewith, which is the order into which the various circumstances in connection with the matter naturally fall.

First the size of the principal objects in the field of view, or the scope to be embraced by the picture. The regulation of this matter is decided by moving the camera. The nearer it is brought to the central object the larger will be the image thrown upon the ground-glass screen, while the field of view is proportionately diminished; and, of course, the reverse of this holds good—the further it is removed, the smaller become the most prominent features, and a larger extent of view is reflected on the screen. The object of the photograph, and the taste or artistic perceptions of the operator, must guide him in deciding these preliminary matters, but they should not be settled in any happy-go-lucky or careless manner, as, unfortunately, is too often the case with amateur photographers.

The next subject that he should regulate is the one involved in the correct arrangement of the camera so that there is no apparent distortion of the view, and that the horizontal and vertical lines are in correct parallel with the marginal ones. After this very important feature in the composition of the picture has been accomplished, the definite sharpening of the focus over the different planes of the view should be carried out. As before said, a magnifying eyepiece will be found very useful in enabling this to be done in a satisfactory manner, but it is as well to practice focussing without the aid of any instrument, for the eyes of anyone with fairly good sight can soon be trained to distinguish the point at which absolute sharpness has been attained; and to be able to diminish one's photographic impedimenta even by a single article is always worth some little effort. By getting the image fairly sharp, and then racking the lens a turn forward and then a turn backward, the point at which it should be fixed is easily visible, for if the eye fails to detect the absolute focus it readily discerns the points at which the blurring commences, caused by increasing and decreasing the distance between the lens and the screen, therefore midway between these points is the one giving the requisite sharpness. By selecting some object in the centre of the picture in the neighbourhood of the most prominent feature thereof, and getting it sharply focussed with the lens working at its full aperture, an increased sharpness can be given to the distance and to objects on the extreme edges of the plate by diminishing the aperture of the lens, that is by regulating the size of the stops. This want of sharpness in the view that is to be found towards the edges of the plate is due to a defect known as spherical aberration caused by

the curvature of the lens, and may be greater or less in accordance with the make of lens being used. By inserting a small stop it is entirely overcome. There are, however, other considerations to be taken into account, which are of importance when reducing the lens diameter available for use, such as the character of the light, the possible limits of exposure, the nature of the negative it is desired to obtain; and other minor matters also hinge upon the question of the size of stop which should be definitely selected. Some of these points will have to be considered when the subject of optics is reached, but the other matters can only be thoroughly mastered by practical experience.

Wherever it is possible, the view to be photographed should be brought into focus and correctly composed without resorting to the use of the rising front of the camera, or to the horizontal and vertical back swing. The manipulation of these movements of the camera necessitate careful study, for they tend to produce distortion in a more or less pronounced manner, and now and again can create worse evils than those that can be overcome by their use.

The correct employment of the rising front is, however, a much more simple matter, the extent to which it is available within the limits the particular make of camera being used will allow, depending on the covering power of the lens with which the picture is to be taken. The circle that every lens covers has a limit, its area being regulated in the construction of the instrument. It is always advisable, therefore, to employ lenses that cover a larger plate than the one intended for use. If the covering power is limited to the exact size of the plate, and the view is to be taken with the back in the ordinary horizontal position, then the upward movement of the lens cannot be made to a point further away from the base line than a distance equivalent to half the length of the plate. If the camera is one of the old-fashioned kind that has to be bodily turned on to its side when upright pictures are required, then a lens that only exactly covers the plate will not allow any up or down movement of the front whatever. As it is sometimes necessary to work with a lens of this character, an additional reason is apparent for the advice given under the heading of Apparatus, drawing attention to the advantages of the square form of camera with the back frame detachable, so that it can be reversed. For of all the movements a good camera possesses, the rising front is the one most often used, as it enables the photographer to considerably reduce the extent of foreground in his picture, or to bring on to the screen or into correct position within the lines of his view the upper part of buildings, such as the distant spire of a church, or in arranging the position of the sky line—a feature of considerable artistic importance.

If the lens is moved away from the centre, the corners of the picture in the opposite direction are the testing points where the extent of its covering power can be ascertained. If the limit has been exceeded, then these corners will not have any image whatever reflected on them. For instance, if the lens has been carried too far upwards, then the lower part of the picture may suffer, hence the need for careful examination.

In some cameras a horizontal movement of the lens is possible; this change of position is, however, very rarely necessary in the case of cameras with reversing backs, unless two pictures are required on different parts of the same plate. Of course, for the other kind of camera before-mentioned this movement is indispensable, because by changing the position of the camera from the horizontal to the vertical, the horizontal movement of the front becomes the upward movement so often required.

A few patterns of cameras will allow the lens to be

lowered as well as raised. Occasionally, under very exceptional circumstances, this is a convenience in focussing, as, for instance, when the operator is working in an elevated position, and a more extended view is required of objects below.

In all these movements of the lens away from the centre of the plate great care should be exercised to see that unequal illumination does not result therefrom in any degree capable of affecting the negative, for their tendency is to produce such a result.

(To be continued.)

## The Construction and Use of Photographic Lenses.

By CLEMENT J. LEAPER, F.C.S.,

Instructor in Photography, City of Dublin Technical Schools.

HAVING in my previous articles on "Photographic Optics" briefly discussed those portions of that science which concern photographers, I purpose in the present series explaining how lenses are made, used, and tested. Beginning with the description of how optical glass is manufactured, I shall next explain how a lens is made from such glass. After this will follow certain scientific preliminaries, such as the discussion of the various defects to which lenses are subject, and, as a sequence to this, data will be given enabling the chief types of lenses to be constructed. Finally some space will be devoted to the description of simple methods by which the good or bad qualities of a lens can be ascertained.

### CHAPTER I.

#### THE MANUFACTURE OF OPTICAL GLASS.

Glass intended for use in the construction of optical instruments must be homogeneous, colourless, and as transparent as possible, and the object of the manufacturer is to ensure this. Two varieties are in common use, viz., flint and crown.

*Flint glass* is a highly refractive glass containing lead and having a specific gravity of about 4, and the following is the recipe said to be followed by a large manufacturer of it:—

White sand	..	..	..	42.50	per cent.
Minium	..	..	..	43.50	"
Potash	..	..	..	11.70	"
Alumina	..	..	..	1.80	"
Lime	..	..	..	.50	"
Arsenious acid	..	..	..	Traces.	

The crucibles employed to fuse the materials are of best fireclay and capable of holding about 5 cwt. of glass. They are heated in a suitable furnace with the best quality coal as fuel, the furnace being so arranged as to permit the contents of the crucible to be stirred from time to time. This is absolutely necessary, otherwise the melted mass would divide itself into layers of different specific gravities.

The crucible having been heated to redness, a twelfth part of the entire charge is put into it and the succeeding portions added from time to time, the exact interval depending upon the temperature of the furnace. When the entire charge has been introduced, the crucible is closed and the whole strongly heated for about six hours, at the expiration of which the lid is removed, and the stirrer, consisting of a rod of fireclay fixed to one of iron, employed to stir up the molten mass. The crucible is then once more covered and heated for an hour, after which the stirring is repeated. After six or more alternations of repose and vigorous stirring, the crucible is heated to intense whiteness and then permitted to cool very gradually by allowing the furnace

fire to die out. After a week or more, the perfectly cold crucible is removed and broken, and the mass of glass removed.

*Crown glass* is a less refractive variety containing a smaller proportion of lead, and capable of being made from the following recipe, the manufacturing details being analogous to those just described:—

White sand .. .. .	64.8 per cent.
Potassium carbonate .. .. .	28.2 "
Potassium nitrate .. .. .	.9 "
Minium .. .. .	5.8 "
Lime .. .. .	.3 "

The glass having been cut into discs, these are carefully examined and sorted into four qualities, of which the best serves for the lenses of astronomical telescopes, the next for photographic lenses, the third quality for graphoscope and stereoscope lenses, the remainder being remelted with the next charge.

Within the last six years the celebrated firm of Abbé and Schott, of Jena, have made quite a number of kinds of optical glass containing phosphorus, barium, boron, and other substances, and possessing decided advantages over the crown and flint hitherto used, but as the employment of this kind of glass is as yet to a great extent in the experimental stage, I will content myself with describing how lenses may be made of ordinary flint and crown procurable from Chance, of Birmingham, or any of his agents.

In ordering a piece of glass for making a lens, it is well to specify exactly for what purpose it is intended, giving at the same time the data from which the lens is to be made, such as refractive index and dispersion. By so doing the seller will generally be able to select a suitable specimen which must measure at least half an inch more than the diameter of the lens into which it is to be converted.

The following are the chief kinds of glass made by Chance and used in the construction of lenses:—

Name.	Specific Gravity.	Index of Refraction.	Dispersive Power.
No. 1 Crown	2.48	1.50	.039
No. 2 "	2.51	1.52	.040
No. 1 Flint	3.20	1.57	.047
No. 2 "	3.64	1.64	.055
No. 3 "	3.84	1.64	.059

(To be continued.)

## The Stereoscope.—XV.

BY VALENTINE BLANCHARD.

WITHOUT doubt the cheapest and at the same time the most efficient stereoscope to be bought at the present moment is the instrument known all over America as the "Holmes" stereoscope. It has survived the neglect of twenty years, and is now being made in rapidly increasing quantities and imported into this country, where it can be bought at prices varying from one shilling upwards. One cannot help speculating what would have happened if this instrument had made its appearance at the commencement of the stereoscopic mania, instead of its close. I am forcibly reminded of an old rhyme, which evidently goes back at least to the time of Shakespeare—

"If ifs and an's were pots and pans,  
There'd be no work for tinkers."

And yet, though fully recognising the truth of the homely old rhyme, I cannot refrain from the *if*; for surely if Brewster had hit upon this ingenious little machine instead of the clumsy, boxed-up instrument that bears his name, the stereoscope must have had a much longer lease of popularity.

I hope I may be pardoned a little pride in being able to say that I was instrumental in the introduction of this now well-known instrument into England more than twenty years ago.

In the year 1867, whilst engaged in making a series of views of the Isle of Wight, I saw by accident at one of the hotels a stereoscope of an altogether unknown form, and inquired of the proprietor if he knew anything of its history. In answer I learned that it had been left behind—evidently forgotten—by some Americans who had been staying there a short time previously. I was so struck by its simplicity and its unusual capabilities that I made inquiries in various directions to know where it could be obtained, but without result. At length fortune favoured me. I described it to an American gentleman well versed in photography. He smiled a smile, and said, "What! you don't know our 'Holmes,' in this country? Why, it's the invention of our statesman, poet, and amateur photographer, Oliver Wendell Holmes, and is sold all over the States for half a dollar." I told him how much I should like to have one, and he promised when he got back he would send me one. Nearly a year elapsed, and I had almost forgotten all about it when a gentlemanly stranger, in naval attire, asked to see me. He had promised a friend in America to place a parcel in my hands, which on opening I found to contain two specimens of the new instrument. Needless to say how pleased I was. I induced Mr. Meagher to make a copy of it. This he did, and made a stand for it, which was an undoubted improvement. I introduced the American stereoscope and Mr. Meagher's copy of it to the South London Photographic Society in October, 1868, and read a short paper on the special qualifications of the new instrument. A few makers took up its manufacture, but it unfortunately came too late, for the fever was rapidly abating in this country; but it is only right to state that the popularity of the stereoscope in America continued for several years after it was almost forgotten here; and this was without doubt due to the superior efficiency of the "Holmes" stereoscope.

The tall instrument on stand in fig. 14 is drawn from a photograph of one of Meagher's stereoscopes made in 1868, and kindly lent for the purpose of illustration. The one lying down is a copy of the instrument as made at the present time in America, and sent into this country for sale.

Doubtless the American stereoscope, as it is now

FIG. 14.

called, is gradually getting known in England; but I am sure there are many readers of these chapters to whom it is a perfect stranger, and therefore for their benefit I will point out its special points of excellence. First of all, it will be seen, on reference to the diagram, that the projecting hood completely protects the eyes from any stray light, and so concentrates the attention on the subject to be looked at. The importance of this improvement can only be fully appreciated by those who remember the discomfort experienced

in looking through the old Brewster form of instrument. Another advantage is when the picture is placed in position, it is open to light in every direction, and in consequence there is more light and atmosphere in the picture when looked at in the instrument; and offering therefore a striking contrast to the effect produced in the old box stereoscope, when the picture was frequently only half illuminated. The greatest improvement of all, however, is the great range of focus furnished by the American instrument. I have just measured Meagher's stereoscope, which is an exact copy of the American model, and find that from the eye-piece to the end of the bar on which the cross-pieces holding the subject slides, the distance is 9 ins., whilst from the eye-piece to the end of the central partition it is exactly 3 ins. Now, only the other day a gentleman who had never been able to see through the ordinary stereoscope, in consequence of the shortness of his vision, was enabled, by pushing the picture up to the partition—that is to say, only 3 ins. from the eye-pieces—to see true stereoscopic effect for the first time. Though he had looked at slides without number, he had failed to extract pleasure from their inspection, and had regarded the stereoscope as quite useless to him. It can be imagined by those who see stereoscopic effect without difficulty the pleasure the newly-found power gave to the gentleman in question. This is an extreme case, but often on watching the instrument in various hands, I have noticed a difference of focus varying from 2 ins. to 3 ins. between different beholders.

Having said so much in praise of the Holmes stereoscope, it is only fair to point out its weak point. A reference to the diagram will show that the slide is held in position by wires attached to the cross-piece, and arranged so as to form a groove in which to insert the picture. It is to be remembered that it is a cheap instrument, and therefore it is not fair to expect too much; but still as the wires are continually getting bent and knocked out of position, one cannot help feeling some alteration is needed to make it more efficient. Some arrangement resembling the painters' easel would answer perfectly. It might be a light frame hinged to the cross-bar, and made to fall down when not in use. It is true this would add slightly to the cost, but in America where wood is so cheap, and where every conceivable kind of woodwork is turned out like lightning by machinery, the additional outlay need not be very serious.

Many readers in looking at the diagram may be led to imagine that the instrument is only available for paper slides, and that it is comparatively useless for the exhibition of transparencies. As a matter of fact it is not so, and no difficulty is really experienced. A sheet of white paper placed at an angle of 45 degs. behind the slide will give perfect illumination by daylight, and the same primitive arrangement can be used at night, care being taken to keep the direct light of the reading lamp or gas-burner from the slide, and employ only the reflected light from the white paper. In all cases it will be found that the most harmonious effect will be obtained when reflected light is used instead of direct light. Broadly illuminate the subject, and keep direct light from the eye-piece, and it will be seen that even for transparencies there is no need whatever for a boxed-in instrument.

(To be continued.)

**Photographing a Wreck.**—Who shall say that the Devonshire photographers are not enthusiastic? Two of them set off recently to photograph the large steamer *Nepaul*, which lay wrecked on the rocks at the entrance to Plymouth Sound. So busy were they under the focussing cloth, that they did not notice the advancing tide, until the crags on which they stood were cut off by the rising tide from the mainland. After a few hours' detention they were rescued a passing vessel.

## Our Contemporaries.

*Anthony's Photographic Bulletin*, speaking of "Some Points Often Overlooked in Toning," says, "Natural scenery contains a far greater number of brown and grey tints than any others; hence black and bluish landscapes appear cold and unnatural. To obtain the best results with landscape prints, and to obtain brown tones, requires much more skill and practice than is generally supposed. If the toning bath is too strong, or too warm, it will work rapidly, and instead of getting the red colour of slowly deposited gold, the blue variety is obtained. On the other hand, if the bath is weak, or too cold, the process is slow and tiresome, and the prints deteriorate upon the surface from long exposure to the action of the chemicals. All things considered, a bath of gold chloride with sodium acetate is the best to use. But a difficulty often arises in obtaining the best results, which is probably due to the character of the sodium acetate used. . . . When we remember how minute a quantity of organic substance will affect gold chloride, we are constrained to believe that many of the troubles of the acetate gold bath may be caused by the traces of tarry impurities in the sodium acetate. To overcome these difficulties it is best to use fused sodium acetate in the toning bath, and any difficulties that might possibly arise from the presence of tar are eliminated, because the tar compounds are volatilised by the heat of fusion of the salt. When the fused salt is added to the toning bath it is only necessary to use two-thirds of the weight called for by the formula, since, by fusion, the salt loses about forty per cent. of water of crystallisation. The fusion of the acetate is a very simple matter; all that is needed is a clean porcelain dish that can be heated upon a fire or over a blue gas flame, taking care to begin the heating slowly, and allow the dish to cool slowly, otherwise fracture is inevitable." Other articles are: "Diazotype," "The Joint Annual Exhibition," "New Method of Preparing Engravings for the Lantern," "Note on the Report of the Lens Standard Committee," "On the Control in the Density of Negatives," etc.

The *Beacon* (Chicago) gives the following method of intensification recommended by Dr. Stolze:—"After the negative has been well washed, but hardened by alum, etc., it is immersed for about a minute in a four per cent. solution of potassium bichromate, and dried in the dark. It is then exposed to light through the back for a few minutes, thoroughly washed and dried again. It is then immersed in a solution of India ink, or other suitable colouring matter, which will, of course, penetrate the swelled portions of gelatine, the amount of colour absorbed being in proportion to the swelling, which is, of course, dependent on the extent to which the bichromate has acted." Other articles are: "Zapon," "A Big Photograph," "The Acid Fixing Bath," "Primuline," "A New Application of the Dusting-on Process," etc.

The *American Journal of Photography* gives the following:—"Dr. Schobrens projected, before the Antwerp section of the Belgian Photographic Association, a series of stereoscopic views with the aid of two lanterns placed in juxtaposition. Each lantern received the half of a stereoscopic view and a coloured glass, red for the view on the right, for example, and green for the view on the left. The two views being superposed in the screen, it sufficed to look at them through a pair of spectacles having red and green glasses (in this case red for the right eye, and green for the left eye), to perceive the non-coloured image with as much relief as in the stereoscope. This effect is produced because each eye only sees one image, as in the ordinary stereoscope." Other articles are: "A New Substitute for Glass and Films," "The Veress Experiments," "Use of Colour Screen with Plain Plates," "A Notable Discovery," etc.

The *St. Louis and Canadian Photographer*, speaking on the subject of "Photography," says, "It is to be regretted that photography has sometimes fallen into unworthy hands. It has been used for low and vulgar purposes, and all right-minded men should unite in condemning the low creatures who so pollute it. If all will unite in this warfare, there will be enough to occupy the minds and pens of writers without condescending to personal attacks because of differences in opinion on subjects not essential to photography's advancement. Whether we write in language strong and severe, or in a lighter vein, let it all tend to the one desirable end." Other articles are: "Aristo versus Albumen Paper," "Art Matters," "Lighting and Expression," "The Silver Bath," "The Gundlach Shutter," "Stereoscopic Work for Amateurs," etc.

*Wilson's Photographic Magazine*, referring to the "Osmium Toning Bath," says, "This toning salt consists essentially of ammonium-osmium chloride and acetic acid, and is fit for use on simple solution in water. On immersing in the bath a washed-out silver print, it first assumes a brown tinge, after which the half-lights tone a deep azure blue. Aristo paper tones deep blue-black when acted on sufficiently long, which gives a very beautiful effect, considerably superior to that of platinum prints. The prints ought not to be washed out between toning and fixing. Formula:—

Osmium ammonium chloride	..	..	23	gr.
Osmiate of potash	..	..	1½	"
Acetic acid	..	..	½	oz.
Water	..	..	36	"

Osmium is one of the rarer metals of the platinum group, and is worth from 35 dols. to 40 dols. per ounce." Other articles are: "Why is it Necessary to Rock the Dish during Development?" "To Remove Yellow Fog from the Negative," "Development of Over-exposed Films," "A New Departure in Washing and Fixing Negatives," etc.

The *Practical Photographer* says, "It is a mistake to imagine that every portrait is improved by vignetting, and it would be a good thing for the art value of portraits if the prices for vignettes were the same in all cases as for plain portraits. A vignette can never be a *picture*, for it lacks all the charm of careful composition. Of course, the vulgar and the thoughtless part of the public choose the vignette because the photographer charges rather more for it than for the plain picture; but photographers who have any ability should stand out against this tendency, which, to a great extent, places them on the level of inferior men." Other articles are: "How our Leaders Work," "Pleasure and Profit on Lake Superior," "Combination," "Practical Work," etc.

The *Photographic Times* (New York), talking of "The Social Side of It," says, "If you are going to travel, and are at all socially inclined, by all means get and take with you a hand-camera. It will pay you over and over again in the pleasant acquaintances you will make, and will give you also a set of views which, in after years, will serve to carry you again and again over your tour, reviving and refreshing your memory, and enabling you to live over again your vacation while sitting in your chair at home with the can't-get-aways. The exchange of pictures with the friends you make while en route renews the interest, revives pleasant and perhaps slumbering memories, and helps to fill the album, which should always be kept of every vacation tour." Other articles are: "Industrial Photography," "The Chemistry of Fixing," "The Moselle," etc.

*Engineering* for January 2nd, in an article on "The Utilization of Niagara," contains excellent reproductions of photographs of the Falls and neighbourhood; they are, "The Rapids Above the Falls," "The Rapids Below the Falls," "The Horseshoe Falls," and "The Rock of Ages."

## Apparatus.

### PLATT'S "SIMPLEX" REPEATING FLASH-LAMP.

MR. E. G. PLATT, of the Birkbeck Works, Birkbeck Road, Ridley Road, Kingsland, N., has forwarded us a specimen of his repeating flash-lamp, which we had an opportunity of trying this week, and found that with a single lens, working at  $f/10$ , and a rapid plate, showing 25 degs. Warnerke, a well exposed negative was obtained with a single flash. The arrangement of the burners is such that complete combustion of the magnesium powder is obtained, and, at the nomi-

nal price of 3s., many an amateur desirous of turning out portraits on these dull days will make a good investment in one or more of these lamps.

## Exhibitions.

### THE EDINBURGH PHOTOGRAPHIC EXHIBITION.

(By our Edinburgh Correspondent.)

Now that the awards in the Edinburgh Photographic Exhibition have been published, it is possible to take notice of the Exhibition in a way that could not be done while it was still in an incomplete state. In the first place, as to the time at which the awards have been published—more than six weeks after the Exhibition was opened—it is explained that owing to the great number of exhibits, and their high standard of merit, the jurors required to devote four days instead of one, as originally contemplated, to the work of adjudication. That is one reason. Another is that the pictures in the various classes were so scattered about the Exhibition, that the work of adjudication was greatly retarded by the amount of walking to and fro which was required. As to the awards themselves, it may be said that, generally, they give satisfaction. There are, however, exhibitors who are disposed to grumble, which is natural. Speaking generally, what strikes one even at the first is that all the prominent pictures, with the exception of those in Class V.—Portraits above 12 by 10, in sets of six—which were of necessity prominent, have been passed over, and the awards have been given to pictures which, so far as the public are concerned, are comparatively obscure. The reason for that is the old one of retouching. As many exhibitors will doubtless be disappointed by the decision of the jurors upon that question, it is necessary, in their interest, to look into the conditions of the Exhibition as set forth in the prospectus. There is no condition in that document which either allows or forbids retouching, and the names of the jurors were not announced till the catalogue came out, a day or two after the Exhibition was opened. Exhibitors, therefore, had no direct guidance as to whether it would be allowed or not. They were thrown back upon their own reading of the prospectus, and were obliged to search in it for a constructive pronouncement upon the subject. Turning to it, it is found that the first paragraph states that "the object of the Exhibition is to direct attention to the development in recent years of photography, and to stimulate further advances by encouraging artistic skill and invention." The third paragraph says, "In addition to the ordinary character of photographic exhibits, etc." In the 7th, 9th, 12th, 14th, 15th, and 17th paragraphs the word "pictures" is used to describe photographs, and the word "photograph" is not once used in the whole prospectus. Further, the 16th paragraph contains the provision that "in Classes XII., XIII., and XIV. the work must be entirely and solely that of the exhibitor." Now, two interpretations of this prospectus are quite feasible. Those who say that retouching is excluded by it may point to the first paragraph, which says that it is the development "of photography" to which attention is sought to be directed, and that inasmuch as retouched pictures are "photographs and something more," they certainly could not be included. To those who have exhibited retouched pictures it is open to say that while the first paragraph is the only one which points to their exclusion, all the other provisions of the prospectus are in their favour. For instance, "the ordinary character of photographic exhibits" is mentioned, and it is notorious that retouching is one of the most ordinary characteristics of photographic exhibits. Then the persistent use of the word "picture," in preference to "photograph" may be held to point to an intention to allow retouching, because the manifest purpose of retouching is to convert what would be merely a photograph into a picture. Further, what is to be said of the provision in the three amateur classes, that "the work must be entirely and solely that of the exhibitor"? What work is an amateur likely to get done for him if it is not retouching? Framing, it may be answered; but though, as a matter of fact, it is elsewhere provided that all pictures must be framed, it is not to be presumed the amateurs were to be excluded from purchasing their frames as they purchased their mounts, and therefore a quite natural supposition would be that it was retouching which was forbidden. I do not say that any or all of these provisions allow retouching, but simply that within the phraseology of the prospectus a good case can be made out for those who sent in retouched pictures. But this leads to the further consideration that retouching was not disallowed in all the classes. No one can look for a moment at Mr. Marshall Wane's series of six portraits above 12 by 10 ins.,

in Class V., for which the bronze medal has been awarded, without seeing that retouching has been carried to an extraordinary extent upon them. If it was allowed in Class V., why has it been disallowed among the enlargements in Class XX? This class was probably the largest in point of numbers in the exhibition. Certainly it was the best display of all. In it the jurors have not yet awarded a first prize, though they have selected a large photograph for the silver medal, which the Council will award if a satisfactory negative (a condition of the competition) is sent on. This photograph, one of a series of platinotypes, by Mr. Worsley Benison, of Chepstow, is by no means a pleasing picture, being hard and unfeeling in tone, but apart from that the jurors certainly went out of their way in making it their choice. If the exhibitor had not complied with the necessary condition of forwarding a negative, they should have walked past the exhibit and given the award to another who had sent a negative. They awarded the second prize to Mr. T. G. Whaithe, Carlisle, for the bromide which, in your issue of December 19th, I selected for condemnation because of its tone and unsatisfactory shading, which led to indistinctness and want of contrast. The decision of the jurors is in all respects superior to mine, but I cannot understand why, when retouching was allowed in Class V., it should in Class XX. exclude the very fine work of, say, Mr. Ayton or Mr. Moffat, of Edinburgh, whose carbon enlargements have been most favourably noticed in all the photographic journals, not to speak of many other exhibitors whose work, whether it be retouched or not, is excellent. This is a point for the jurors to clear up. They were, undoubtedly, left to themselves upon the question of retouching, and had they acted consistently their decision would not have been questioned, but they seem to have acted inconsistently in their decisions with reference to the above two classes, which is unaccountable when the time they took to arrive at their conclusions is taken into account. Their awards are, however, final.

With regard to their decisions in other classes, it may be said that in Class I., Mr. Richard Keene, of Derby, gets the silver medal for six landscapes in platinotype, which are well selected and very softly, in some cases rather too softly, printed. In Class II., F. Boissonnas, of Geneva, gets the first place for a most beautiful silver print from an orthochromatic plate, of a richly flowery dell. The printing is clear to the smallest detail, the composition is excellent, and the photograph is altogether one of the most pleasing in the Exhibition. Mr. H. P. Robinson also gets a silver medal in this class for his "Selecting Flies," a whole-plate platinotype very lightly printed, and which is looked upon here as not his best photograph. In Class III., Mr. John Moffat, Edinburgh, is first with a very fine frame of fourteen portraits, half and three-quarter plate in platinotype. Messrs. Window and Grove, London, get the silver medal in Class IV., for six platinotype portraits in which the figures are very softly printed, but the backgrounds are intentionally left indistinct, to the great delight, doubtless, of the naturalistic school. Mr. Crooke, Edinburgh, is first in Class V. with his magnificent set of portraits in platinotype of Scotch judges and leading citizens, in which his great faculty for handling the shadows is so well exemplified. In Class VI., J. H. Hogg, Kendal, is silver medallist with a three-quarter length portrait of a lady, very delicately printed in platinotype. Class VII.—Combination Printing—was a very small class, and the work sent forward was not of sufficient quality to merit an award. In Class VIII., Lyd. Sawyer, of Newcastle, gets the silver medal for an "At Home" portrait-group in platinotype which is very clearly printed, but rather stiff in composition. Mr. Charles Reid, of Wishaw, is silver medallist in Class IX.—Instantaneous—for his unequalled groups of animals, printed half-plate size in silver. In Class X.—Architecture—Mr. Wm. Mitchell, Dalkeith, is first with six exceedingly well-lighted interiors, wonderfully free from halation, and clearly printed in platinotype. In Class XI. no first prize is given, but three bronze medals are awarded, one to Mr. Andrew Pringle, for a series of photo-micrographs in bromide, of bacilli, etc.; another to Dr. Piazza Smyth, Edinburgh, for two large bromides which show the invisible lines of the spectrum; and another to Mr. Gambier Bolton, London, for his series of animal studies in carbon, which are so much admired. J. H. Forbes, Edinburgh, is first in Class XIII. with a delicate print in platinotype of a Swiss scene. In Class XIV., J. G. Patterson, Eskbank, is first with several softly-printed and well-selected views in Derbyshire,

printed in Blanchard's platinum. In Class XV.—Prize Pictures—the exhibits were of such equal merit that the jurors felt it would have been invidious to have made an award. In Class XVI.—Lantern Slides—G. W. Wilson and Co., Aberdeen, though closely run by others, get first place for a very fine set of six artistically selected views. In Class XVII.—Reproductions—the Autotype Company, London, are first. Four silver medals are awarded in Class XIX. for photo-mechanical prints. One goes to the Autotype Company, London, for a large autogravure portrait in engraving black; another to Mr. Walter L. Colls, London, for a series of nine small intaglio reproductions in black and sepia tones; another to Mr. Jas. C. H. Balmain, Edinburgh, for three photo-engravings, firmly printed in dark tone; and another to W. J. Annan and Sons, Glasgow, for a photogravure reproduction of portraits by Raeburn. In this class all the awards are certainly well merited. Class XX.—Enlargements—is dealt with above. In Class XXI.—Apparatus—silver medals have been given to three exhibitors. Mr. J. M. Turnbull, Edinburgh, shows the most original apparatus, his stand containing his hand-camera, film slides and carriers, and walking-stick tripod. The camera is fitted with a rapid rectilinear lens to work time or instantaneous, with graduating focussing arrangement, and is suitable for hand or stand work, one of the most complete and at the same time plainest and most moderately priced hand-cameras in the market. His walking-stick tripod is the leading article of the kind. It is made of telescope tubing, each leg consisting of an outer tube with two smaller inside, which, when drawn out, give the required height, and besides, the six points of contact with the top, which is a desideratum in all tripods, and which gives to this all the rigidity of an ordinary stand. The most ingenious part of the stand is the making of each leg sectionally in the form of a third of a circle, which enables the whole, when folded up, to be put into a circular case.

G. Mason and Co., Glasgow, make a large show of excellent apparatus, and have obtained a medal for their collection, in which is an automatic studio stand, a neat-looking article which works easily; a Scovill camera (24 by 20), and a patent burnisher. The burnisher, which is their best exhibit, has an arrangement at the side by which the roller is adjusted to suit the thickness of the mount. They also show a series of cameras of their own manufacture, in all the ordinary sizes, and which look in all respects exceedingly serviceable. Mr. W. Wray, London, is the other medallist, his exhibit, of course, consisting entirely of the lenses for which he is famous all over the world.

A good estimate is afforded by the awards of the esteem in which the different printing processes are held by gentlemen in the position of jurors. Excluding the classes in which the printing was compulsorily by a certain method, there are forty awards, of which twenty-two are for prints in platinotype, other six are for photographs platinum toned, and one is for a photograph in Blanchard's platinum, making twenty-nine in one form or other of platinum printing. Of the other eleven, there are two first and three second prizes for silver prints; one first and three second for bromides, and two second for carbon prints. These figures show the decadence of the silver print, and also the bromide prints are not considered equal to platinotype, and they point future exhibitors clearly to the conclusion that if they wish to succeed they must print in platinotype.

Last week was a busy week in the Exhibition, which was, towards the end of the week, quite thronged with visitors. From Tuesday onwards, too, there were nightly exhibitions of lantern slides. Tuesday night was occupied by Mr. Blanc's lecture on "The Architecture of Normandy and Brittany," which was postponed from the previous Friday evening on account of a gas cylinder being found to be empty. The lecture was a very instructive one, and the slides, mostly prepared from photographs by Mr. Blanc himself, were excellent, but the lantern was very awkwardly handled. Surely the Edinburgh Photographic Society could command a better apparatus than a single lantern. On Wednesday night Mr. Mitchell showed the slides which are on exhibition. On Thursday night Mr. Thomas Barclay, the Secretary, showed a series of slides illustrating the scenery amid which the leading events of English history have been enacted. On Friday night the Rev. Robert Paul, Dollar, gave a series of slides of great merit illustrating the passage of the St. Bernard Pass in winter; and on Saturday night Mr. Wm. Hume, Lothian Street, Edinburgh, exhibited a series of views of Perthshire scenery. In the latter half of the week I am glad to be able to say the lantern was well handled.

## Notes from the Liverpool Centre.

(By our District Editor.)

I REGRET to announce the somewhat sudden death of Mr. Francis Faltin, one of the most genial and painstaking members of the Liverpool Society. At his burial on New Year's Day, Mr. Paul Lange, Mr. T. S. Mayne, Mr. E. M. Tunstall, and other local amateur photographers attended. Mr. W. P. Christian, owing to ill-health, has been ordered abroad, and will be away for some months. He is a most enthusiastic worker in photography, very clever; and one of the leaders of the Liverpool Society.

On Thursday, the 15th of this month, Mr. Geo. E. Thompson, President of the Birkenhead Society, is to give a soirée in the new hall of the Y.M.C.A.

At the Walton Society on Wednesday last, the programme of business included the discussion of "Methods of Intensification and Reduction."

Messrs. Archer and Sons, of this city, have several novelties in lanterns and their working. Through their kindness the "Terpuoscope" was manipulated at the Liverpool rooms a few nights ago, the instrument giving complete satisfaction.

The main feature of this new lantern is that the views are changed by means of an automatic registering slide-carrier and rolling-curtain effect, worked by a rack-and-pinion adjustment. Messrs. Archer also have a very ingenious new dissolver for single lanterns, the pictures on the screen being dissolved without changing and without leaving the hitherto dark cloud. I shall have something further to say of these novelties next week.

At a meeting of the 1891 Exhibition Committee this week, important details in connection with the catalogue, tickets, etc., were decided upon. Season tickets will be 7s. 6d. each; members' tickets, 2s. 6d. each; single admission, 1s. per day.

## Societies' Meetings.

**Dukinfield.**—The monthly meeting of members was held on Monday, the 29th of December, when a good number of members and friends had the pleasure of viewing the *Photography* prize lantern slides, 1890.

**Jersey.**—The society is to be congratulated on a very good and interesting show of about 500 of its works at their rooms in Grove Place. Criticism in this branch of art is a very difficult task, the photographic and artistic views being often diametrically opposed—the suppression of detail, too seldom deemed obtrusive in the former case, too indiscriminately in the latter. In strong effects suppression of minutiae often gives force, whereas detail of texture, etc., are often the very things which give an interest of antiquity, marking the ravages of time and weather. The exhibition is divided into five classes. In the landscape division the silver medal of the society is awarded to Colonel Jackson, for his admirable series of views taken during the summer excursions. This gentleman was also awarded the first prize for the best landscape—a very brilliant little cottage piece, in which the sunshine is admirably expressed. There is a similar one of his in another part of the room with a plain sky, which leads us to suppose the clouds were added—an instance of good judgment, as this addition seems to be the key of its strong effect. Mr. J. Andrews has a very artistic series of small views; in a frame of six, the lower three were especially good. "A Misty Morning" has artistic merit, and in a less degree "Gravelotte Village," but this latter was somewhat damaged by the arrangement of figures. We next notice a water mill, "Greve de Lecq," also a well-managed view of the difficult subject of Gorey Castle, with a dark shadow, perhaps too dark in the foreground. Mr. G. Michel, C de Rue, is very good, and the clear and defined treatment is suited to the special subject. There are also some good interiors placed above it. The section we most admired was the enlargements, amongst which stood in first rank "A Jersey Lane" and "Two Peeps at Greve de Lecq." "A Retriever Dog," by Mr. Rogers, was also excellent. "A Yacht," large cutter, "Gateway of Mont Orgueil," "An Indian Interior," and "Old Houses, Dinan" next to it; also "A Cottage, St. Ouen's, Jersey." Passing on again from the enlargements, we come to another cottage at Rozel, a silver print, which we much admired. "A Forest Road" is a goodish composition of trees rather spoilt by a white leaf coming out from the foreground; this might have been removed. Of the instantaneous photographs; the best, perhaps, is "Seeking Shelter," not for competition, but we think that a good sky would have improved it. "A Yacht," to which a special certificate is awarded, is also excellent, as was the "Sarah King" brigantine. "Dinan" was good as a photograph, but had nothing which could not, we should imagine, be done as well by the ordinary process; perhaps if taken from a lower level

a better effect might have been obtained. "St. Malo" had some elements of the picturesque in it, the composition of dark spots breaking the long hard lines so difficult to deal with in photography. Amongst the portraits the prize is obtained by Mrs. Haddon Smith, but perhaps the best portrait was one in the special certificate frame placed next to it. The first prize in each was a *bronze jewel*. The judges first awarded the jewel for landscapes to Colonel Jackson, and the remainder to the President (Captain Lamb), but when the rule "that no member is to win more than one jewel" was pointed out they revised their decision, and the awards now stand as follows:—Landscapes, Colonel Jackson, medal; Mr. Andrews, certificate; Mr. F. Toms, certificate. Instantaneous, Dr. Taylor, medal; Captain Lamb, certificate. Genre, Mrs. Haddon Smith, medal; Captain Lamb, certificate; Major Stuart, highly commended. Enlargements, Captain Lamb, medal. Transparencies, medal withheld; Mr. Messervy, certificate; Captain Lamb, certificate. The exhibition was open to the public for two days, during which time a great number of people visited the large and well-lighted hall, in which the photographs were on view, a special interest being taken in the numerous lantern slides, which were arranged in frames round a table covered with white paper. Messrs. Baker and De Faye showed a large assortment of photographic apparatus. The evening of the last day was occupied by a display of members' lantern slides, on a screen 12 ft. in diameter. Each picture was fully described to a delighted and enthusiastic audience.

**Leith.**—The ninth meeting of the current session of the above association was held on the 30th ult., Mr. W. Dougall, President, in the chair. Dr. Hugh Marshall delivered an exceedingly interesting lecture on the "Platinotype Process," in which he sketched out the history of this method of printing, described by means of chemical symbol on the black board the preparation of the paper, together with the changes which were effected by exposure to light, and the subsequent operation of floating the partly visible image on a hot oxalate of potash bath. The lecturer accompanied each step with an ocular demonstration of the method employed, from the placing of the sensitive paper in contact with the negative to the finishing of the print. The nominations of office bearers for the ensuing session were adjourned to the January meeting.

**Newcastle-on-Tyne and Northern Counties.**—The London Camera Club collection of Mr. Lyddell Sawyer's principal photographic studies, old Newcastle places and faces, river scenes, marine subjects, instantaneous effects, genre studies, etc., are now on view at the Central Exchange Art Gallery, Newcastle-on-Tyne. The annual meeting will be on the 13th inst.

**South London.**—At the meeting on the 2nd inst., the President, Mr. Edwards, in the chair, Mr. Howson gave a demonstration of the new lantern plate brought out by the Ilford Co. He exposed a number of plates behind quarter-plate negatives, four in particular being exposed for 7½, 15, 20, and 25 sec. respectively, at 18 in. from a batswing burner, using the same negative in each case, and developed them altogether. The only difference to be detected was in the time of development, the results being indistinguishable when fixed. In reply to inquiries, Mr. Howson said he strongly recommended hydroquinone for the new as well as for Alpha plates, and considered the former to be about sixteen times as fast as the latter. On January 16th Mr. Warnerke will give a demonstration on "Mechanical Printing as applied to Photography."

**Staff. Potteries.**—A lantern entertainment was given to the inmates of the Haywood Hospital, Burslem, on the 1st inst., by Messrs. Hewitt and Powell (Hon. Secs.), on behalf of the Staff. Potteries Photographic Society. A number of views of local interest were shown, together with some comic slides, and also a set descriptive of a tour in Norway. The entertainment was much enjoyed by the inmates, and another one was promised later in the winter.

**The Photographic Society.**—An ordinary meeting will be held at 50, Great Russell Street, Bloomsbury, W.C., on Tuesday, the 13th inst., at 8 p.m. A paper will be read by Mr. E. H. Maunder, F.R.A.S., on "Photography Applied to Astronomy."

**West London.**—A meeting was held on the 2nd inst., Mr. W. A. Brown, President, in the chair. The first part of the evening was spent in examining an exhibition of apparatus, the work of members. Mr. Rogers showed an apparatus for making lantern slides by reduction, the whole of which, including the dark-slide, being constructed of pine. He also exhibited a tourist's half-plate camera and slides, both the reducing and tourist's camera being constructed by himself. Mr. Winter explained a novel form of walking-stick tripod for hand-cameras, constructed entirely of metal. Mr. C. Whiting exhibited some prints from wet-plate negatives, which had been orthochromatised with erythrosine, also a very convenient revolving cutting-knife for cutting out lantern masks, and a useful developing brush, made of a piece of felt fixed in a wooden handle. The annual exhibition of members' work and conversation will take place on Friday, the 9th, at the Broadway Lecture Hall, Hammersmith. On Saturday, the 10th, there will be an exhibition of the prize slides at 7.30.

## To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance, the *number and full title of the query* referred to.

## QUERIES.

**4430. Enlarged Copy.**—Will some one please inform me how to proceed to take a cabinet negative from a carte-de-visite portrait?—**RING.**

**4431. Argentotype and Sepiatype Papers.**—Can any of your readers give their experience with these papers, saying what the results are?—**W. R. COORFIELD.**

**4432. Mottled Marks on Negatives.**—Can anyone tell me why I have got, in the sky of many of my negatives, curious mottled markings, looking something like network? I use Ilford ordinary dry plates, and develop with pyro, and have had the plates by me some six or eight months. These marks appear on developing, and seem to come whether the plates are developed immediately after exposure or not.—**PUZZLED.**

**4433. Bromide Prints.**—Having developed a number of bromide prints lately, I have several that are not a good colour. Some are too grey, others a greenish-slaty colour, and a few are too black. Can I improve these in any way which will be worth the trouble? Any information will oblige.—**B. T. F.**

**4434. Copying.**—I want to copy some oil paintings and plates in the *Magazine of Art*, using an Instantograph lens. What stop should I use, what exposure should be given, and what light? I do not want to copy them the same size. Please don't refer me to any books. Any other hints about copying will also be gratefully received by—**NIEPCE.**

**4435. Tripod.**—I am in want of a good rigid tripod. Can any reader of the **AMATEUR PHOTOGRAPHER** recommend me a good one? It must be rigid, cheap, light, strong, and well made. It is for a half-plate camera, price not to exceed 12s.—**NIEPCE.**

**4436. To Make Hand-Camera.**—I want to make a hand-camera, one that can be used on a tripod, if desired. Will someone kindly tell me a good way of changing plates without any risk of scratching the film or double exposure?—**E. W. M.**

**4437. Book on Exposure.**—Will anyone kindly inform me if there is any book treating on exposure in the studio? as I find, in treating different complexions, the same exposure does not do. Also the variation in colour of background for same? If no book, I should be glad of information from my more learned brethren. Thanks in anticipation.—**PORTRAITURE.**

**4438. Camera Making.**—I am about to make a half-plate camera, and should be glad of advice as to what style is best, and whether with conical or parallel bellows? Also what form of double back?—**DEVON.**

**4439. Fixing Prints without Hypo.**—On page 719 of "British Journal Photographic Almanack" Dr. Leisegang recommends chloride of magnesium for this purpose. Has any brother amateur tried it on Leisegang's paper? If so, I shall be glad to know what results he got. Dr. L. states that if any be left in the print after washing it will have no injurious effect; is this so? What quantity should be used in place of hypo in making the combined toning and fixing bath, and what is the price? as I cannot find it mentioned in any drug list I possess.—**THE DOOK SNOOK.**

**4440. Vignette Glasses.**—Could you kindly tell me one of these?—**O. APPLETON.**

**4441. Oil for Lantern.**—What oil is best for use in the lantern? What chemicals should I add to it (and in what proportions) to obtain the best light?—**LYTHE.**

**4442. Toning.**—Why does gold deposit? I use—  
Borax ... .. 90 gr.  
Water ... .. 15 oz.  
Gold ... .. 2 drams.  
and always find gold deposit. With acetate of soda I get no gold deposit. Will someone kindly help—**PERPLEXED.**

**4443. Toning Matt Prints.**—I have been printing on matt paper; but find in washing and toning the print washes off in the first washing, or disappears in the toning solution. I only washed in one water, and toned in the ordinary acetate bath. Ought the prints not to be washed, and should another toning bath be used? Any information your readers will be kind enough to give will be very acceptable to—**J. H.**

## ANSWERS.

**4420. Development.**—An instantaneous photograph taken on an Ilford extra-rapid plate—I presume the red labels meant—should appear on plate within 5 minutes, and the development complete within 20.—**HAMISH.**

**4420. Development.**—From five to ten minutes, if properly exposed.—**W. A. J. CROKE.**

**4421. Mounting Prints.**—Make a paste of common starch, and use this for mounting the prints. It is made easily, and suits very well.—**HAMISH.**

**4421. Mounting Prints.**—You cannot have a better, simpler, or more convenient mountant than starch.—**W. A. J. CROKE.**

**4422. Frost on Negatives.**—Place a cardboard covered with black cloth or velvet outside the window, at an angle of 45 degs. Place the camera inside, use *f/20* stop, and give about 5 secs. exposure.—**MEMNON.**

**4423. Camera Adapters.**—The only objection to these is that, unless the camera is so constructed as to alter the position of the tripod top, the adapter makes the camera extremely unsteady, because the greater weight is not over the centre of gravity of the stand. If this is arranged they act all right.—**ISIS.**

**4424. Bromide Paper and Hydroquinone.**—"Bromide" will find a very good formula in *AM: PHOT*: vol. xi, No. 290, page 291, by Mr. Andrew Pringle. I have just been using it with Eastman's B bromide paper. It produces a fine rich black, while the picture comes out regularly and well under control. The formula for 2 oz. developer is

(A.)				
Quinol	...	...	...	4 gr.
Sulphite soda	...	...	...	12 "
Distilled water	...	...	...	½ oz.

(B.)

Sat. solution of washing soda.  
These can be made up in larger quantities. For use, take A, ½ oz.; B, ½ oz.; and water, 1 oz. I should advise development to be stopped at the right depth by throwing away developer and pouring on *without washing*—

Alum	...	...	...	110 gr.
Citric acid	...	...	...	25 "
Water	...	...	...	5 oz.

This arrests the action at once, and keeps the whites pure, but should not be left on too long, as it has a reducing effect. Eastman's B paper is A1.—**ISIS.**

**4424. Bromide Paper and Hydroquinone.**—I always develop Eastman's bromide paper with hydroquinone, and find it works well. I use the same formula as recommended for the Ilford bromide paper for developing their Ordinary (yellow label) plates. After developing, and previous to washing, I immerse prints for a few minutes in solution of ½ oz. citric acid to 5 oz. water, after which I wash and fix in the ordinary way.—**QUINOL.**

**4424. Bromide Paper and Hydroquinone.**—I have not the least difficulty in getting most excellent prints on Eastman's bromide paper, using a hydroquinone developer. If "Bromide" will send me his address I will give him the formula I use. I do not know who invented it, but it is the best developer I know of, and I have tried many.—**CYPRUS.**

**4425. Reduction.**—If the lens is working with *f/16* stop, the increase of focus would make this much smaller, and the exposure would be about 15 secs.—**MEMNON.**

**4426. Perfect Brand of Paper.**—The brand of this paper is called Perfect. I do not know whether it can be obtained in Leeds or not, but I have no doubt it can. Most dealers stock it. Any tone can be got with this paper, of course, a great deal depending on the negatives.—**HAMISH.**

**4427. Building Amateur Studio.**—If "Hereward the Wake" will forward address, I shall be pleased to give directions; but should like to know height of side walls and to top of roof.—**LADY TORFRIDA.**

**4428. Combined Enlarging and Optical Lantern.**—Hume's Cantilever enlarging apparatus is

without doubt the most perfect and compact lantern in the market. I have lately had the quarter-plate size (5½ in. condensers) adapted so as to show lantern slides, by having a 4 in. condenser made interchangeable with the large one, and the base of the lantern lowered, etc., so as to let the light nearer to the smaller condenser. These alterations have been carried out for me by Mr. John Trotter, 24, Gordon Street, Glasgow, and I would recommend "Mahdi" to communicate with him, as he is a practical optician, and understands photography. This limelight combination will cost only about £10.—**ENLARGEMENT.**

**4429. Transferotype.**—Cannot now be had anywhere.—**MEMNON.**

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us **BEFORE TUESDAY MORNING'S POST** if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—**ED: AM: PHOT.**

**NOTE.**—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.

**M. EGBERTON.**—(1) No. (2) One of the small brass finders, which can also be converted into a focussing magnifier, attachable either top or side. (3) Place the prints face downwards in a dish, with water at 75 deg. F., leave for ten minutes, and then change the water every ten minutes; take the prints out, and blot off between blotting paper between each change of water.

**DENMARK.**—Shutters, No. 2; plates, No. 4.  
**E. A. YERBURY.**—We place as follows—5, 6, 4, 3, 1, 2.

**GIULIO FAIDA (Venezia).**—The two lines, A and B, are possibly caused by light let in the hinge of the dark-slide, and the marginal fog by the plates being old. Were they colour-sensitive plates? Please let us have a little more details about them.

**H. S. W. R.**—(1) Certainly; the idea is by no means new. (2) Yes, with lens at *f/8*. (3) Yes; wash before putting in acid, but this acid bath is not necessary when using hydro. (4) No.

**E. CLARKE (Smynna).**—We have received your note with list of 19 hand-cameras, and we will write you, as the list is too long to answer here.

**ART STUDENT.**—No. 3 meter is a reliable instrument, when backed up by the experience you have hitherto had, and does not require much study to successfully work. No. 1 or No. 4, rough surface. The loss of the distance is due to the extra density of the distance in the negative. This may be avoided to some extent by exposing longer, or backing the foreground with matt varnish. The ground opal glass should be close to negative, and light central, about 4 in. off. The use of tin reflectors all round would be of great help. When pointing to the sky it is advisable to use ground-glass, no reflectors will be required, the exposure would be much shorter, but more uncertain to calculate. A good medium can be made by dissolving

Dammar	...	...	...	150 gr.
Turpentine	...	...	...	5 oz.
Benzine	...	...	...	5 "
Oil of lavender	...	...	...	50 drops.

When dissolved, rub on the film with the tip of the finger. The prussiate and hypo will reduce well. Hand-camera No. 1 is good. The above is a good matt varnish also, the amount of benzine determining the degree of matt obtained. Always pleased to help you.

**G. E. WILSON.**—S. L. is decidedly preferable to your present instrument, especially for odd work.

**R. S. VICKERMAN.**—Yes; try the bath instead of the one now in use. If this is not effectual, send us a negative, and we will examine the deposit.

**SCOTEMAN.**—We are certainly in favour of No. 1. It is not too light for rigidity, but do not think you will get quite such a long focus as you require. The half-plate racks out to 16 in., the 7½ by 5 to 17 in.

**R. R.**—We should prefer the doublet. It is a reliable instrument, and well worth the price asked. The one we had was an excellent one.

**E. W. MALE.**—(1) A good deal depends upon the weight of the ribbon, but 11½ in., weighing 23 gr., will burn for 30 secs. (2) No; certainly not.

**A. W. BULLEN and J. H. NUNN.**—Let us know, please, whose paper and what method of developing, etc., was pursued. In the meantime we will test print.

**ABOLUS.**—(1) C, (2) F.  
**FRED MERCER.**—The plates named are in "common" use, and give excellent results in the hands of hundreds of workers, and are quite suitable for your purpose.

**J. W. WESTERN.**—(5) Over-exposed and under-developed. (8) Fully-exposed, fogged in developing. (10) Fully-exposed, under-developed. (11) Fully-exposed, fogged in developing. (6) Slightly under-exposed, over-developed. (13) Over-exposed,

fogged in developing. (14) Ditto. (20) Overexposed and under-developed. You are dreadfully at sea in developing, and if you will call next Monday afternoon we shall be pleased to give you a hint or two.

NOVICE.—Use the same developer as given in your note, but measure out the pyro, add the water, and then one drop of your ammonia mixture, flood the plate with this, and after one minute add another drop, then after another minute another drop, and so on till full density is obtained. Let us see results then.

DAVID JAMES.—Most certainly you would get better results.

ANGLE.—We are always much obliged if "Old Subscribers" will "express their views," and in the matter you call attention to we are very much of one mind, and have followed up your suggestion and others upon the same subject.

T. EDWARDS.—You will note that we have extended the time for sending in prints for the "Seven Ages of Man" Competition.

S. ROACH.—Yes, you can enter them, but they will stand no chance. Try and do something better.

ROYAL NAVY (China).—A, an interesting curiosity; B, very fair; C, good; D, a little too black and white; too much restrainer used in developer; E, very fair, considering the paper; F, good, but print slightly flat—you want a little more chlorate of potash in sensitising liquid; G, good; I, good; J, the best so far; K, very good; L and M, both very interesting, the latter the better of the two; N, excellent; your platinos are too flat. Your experience of spotted plates is not new by any means, and generally arises from the varying temperature and dampness. We always keep our failures as danger-posts on the road to success. We will write you shortly.

SPIKE.—The alba-carbon has been used both for lantern-slides and enlarging, but we know of no place where the transformation could be effected. Send a stamped addressed envelope, and we will write you.

## Monthly Competition.

### No. XX.—PORTRAITURE AND FIGURE STUDY.

Title of Photograph.	Name of Sender.
An Everyday Flora ...	E. Winn
The Stirrup Cup ...	P. Sheard
Rose ...	D. Petty
Fishermen Mending their Nets ...	F. G. Smart
Santa Claus ...	A. R. Dresser
Playmates ...	E. J. Appleby
In the Studio ...	W. A. Southwell
An Hospital Patient ...	R. J. Hillier
In the Conservatory—Feeding the Birds ...	Rev. G. E. Hermon
The First Teetotal Ironworker ...	R. W. Copeman
A Home Study ...	F. W. Bidford
Doctor Sophie K. ...	Miss Beatson
The Woodcutters ...	E. P. Vulliamy
Waiting ...	H. M. T. Tudor
Broom-Maker, Bagshot Heath	E. Dellamotte
His Thoughts are Far Away ...	Rev. A. Burnell
A Young Cyclist ...	Miss S. Bird

Mamma's Darlings ...	J. Frazer
Marbles ...	A. James
A Son of the Sea ...	J. W. Eadie
Ladies of the West Cornwall Golf Club ...	F. B. Smith
A Professor of the Royal Academy of Music ...	G. R. Betjemann
Let me Put It on Straight ...	J. H. Thornton
The Hay Party ...	H. L. Bridger
Begging for a Poor Friend ...	B. Jumeaux
Daddy's Coming ...	Mrs. Malcolm
Honble. Mrs. Benyon ...	Mrs. M. Benyon
On the Wye—What does it Weigh? ...	F. Glazebrook
My Sister ...	W. Smedley

## Holidays with the Camera.

THE following is a list of the competitors:—

### CLASS I. (GOLD "NIEPCE" MEDAL).

Austin, John E. (Maidstone), "On the Yorkshire Coast."

### CLASS II. (SILVER "NIEPCE" MEDAL).

No entries.

### CLASS III. (BRONZE "NIEPCE" MEDAL).

Cobb, Cyril S. (Surbiton), "To Corsica and Back."  
Livingstone, John C. (Edinburgh), "Whitby and its Surroundings."

### CLASS IV. (GOLD "AMATEUR PHOTOGRAPHER" MEDAL).

Galletly, Edwin G. (Edinburgh), "In Normandy and Brittany with the Camera."  
Dresser, A. R. (Bexley), "A Trip in Brittany."  
Fraser, J. (Arbroath), "In the Glens Esk and Prosen."  
Naylor, John (Harrowden), "Chester and North Wales."  
Stow, Rev. Fred. W. (Bedale), "A Winter Outing."  
Taylor, J. Kidson (Buxton), "Connemara."  
Harding, Martin J. (Shrewsbury), "Hand-Camera Studies on Conway Sands."

### CLASS V. (SILVER "AMATEUR PHOTOGRAPHER" MEDAL).

Tresilian, Richard S. (Dublin), "Round About Loch Lomond."  
Jeffrey, Edwin H. (Barnes), "A Short Trip in Holland."  
Corder, A. H. C. (Brighton), "Llangollen and Bettws-y-Coed."  
Newland, Surg.-Gen. A. G. E. (Burma), "A Day in the Nizam's Capital, Hyderabad Decan."  
Ferrier-Kerr, H. (Worthing), "Among the Alps."  
Sheard, Percy (Birstall), "Olla Podrida; or, Holiday Wanderings."  
Eadie, John W. (Airdrie), "Holidays with the Camera."  
White, John (Dublin), "Dublin and Surroundings."  
Clarke, S. Francis (Louth), "Eight Days in Yorkshire with a Camera."  
Tims, John (West Ewell), "Rambles Around Hastings."  
Howie, W. L. (Eccles), "To Ober-Ammergau and Back in 1890."  
Fielden, Captain E. J. (Maida Vale), "Littlehampton."  
Jumaux, Dr. B. (Morecambe), "To China and Back."  
Turner, Alfred (Meriston), "Holidays, 1890."

### CLASS VI. (BRONZE "AMATEUR PHOTOGRAPHER" MEDAL).

Sharland, R. W. (Wandsworth), "A Week at Cheddar."  
Shadbolt, Cecil V. (Chislehurst), "Aberfoyle to Loch Tay, by way of the Trossachs."  
Hammond, C. W. (Halstead), "Holiday in Purbeck."  
Parritt, H. William (London), "Three Weeks in North Wales."

Ellis, Henry (Potter's Bar), "In the South of France."  
Malcolm, Mrs. Louisa (Leeds), "Tour in Jersey."  
Whittard, W. H. (Streatham), "Bye-Paths in the Home Counties."  
Allen, Herbert B. (Nottingham), "From the East to the West of Scotland."  
Leeson, Arthur J. (Birmingham), "In North Devon with a Hand-Camera."  
Chamberlain, J. (Tunbridge Wells), "Littlehampton and District."  
Somers-Scott, T. A. (Dorking), "An Autumn Trip to Rome."  
Putland, Edwin E. (Blackheath), "Around Dartmouth and South Devon."  
Pritchard, Fred. P. (West Hampstead), "Llandaff, Bristol, and Arundel."  
Wain, E. B. (Norton-in-the-Moors), "A Week in the Isle of Man."  
Herbert, William (Cardiff), "Glamorganshire."  
Goodwillie, Henry (Dublin), "Unconsidered Trifles."  
Emanuel, Charles (Hyde Park), "Concarneau, a Photographer's Paradise."  
Davis, T. H. Vere (Brockley), "A Trip to Cornwall."  
Holt, Harry (Liverpool), "Devon, Lake District, Wales, and Yorkshire."  
Longmore, H. A. (Sydenham), "In and About Dunbar with a Hand-Camera."

## Testing and Reporting Department.

	Fee.
1. Testing and Reporting on Lenses ...	2s. 6d.
2. Testing and Reporting on Plates and Bromide Paper ...	2s. 6d.
3. Testing Exposed Plates ...	2s. 6d.
4. Testing Shutters ...	5s. 0d.
5. Testing Coloured Glasses and Media for Lanterns and Dark-Room Windows ...	2s. 6d.
6. Reporting on Apparatus bought through the Sale and Exchange Columns (2½ per cent. on sale price of apparatus minimum) ...	2s. 6d.

NOTE.—In every case a full and ample certificate will be given, particulars of which will be furnished upon application to the

"TESTING DEPARTMENT,"  
AMATEUR PHOTOGRAPHER,  
1, CREED LANE,  
LONDON, E.C.

## Quarterly Examinations in Photography.

### QUESTIONS.

1. Give the salient points to be observed when choosing a camera and tripod.
2. How would you choose a lens?
3. What is the best form of instantaneous shutter, and why?

NOTE.—Answers must be received on the morning of the Monday week following the publication of the question—Monday, the 19th inst. All answers to be preceded by the Question, and to be written on one side of the paper only, and endorsed with the full name and address of the competitor. Answers must not exceed 250 words, unless otherwise stated by the examiners. Marks will be given for all answers, and, when possible, the best three will be published. Three prizes will be awarded at the end of each quarter.

All communications to be addressed:—  
"EXAMINATION DEPARTMENT,"  
AMATEUR PHOTOGRAPHER,  
1, CREED LANE,  
LONDON, E.C.

## Lantern Slide Exchange.

NOTE.—There is NO CHARGE for insertion in this column. All announcements must be received by Tuesday morning.

Will exchange any of my lantern slides for three dozen coloured slides of stories.—A. R. Dresser, Bexley Heath.

Beautiful sets "Gabriel Grub" (by Newton), Holy Land, Switzerland, Egypt, Rhine, America, etc., or exchange other good sets.—G. Franklin, Rickmansworth.

Will exchange from a dozen to twenty slides of Devon and Cornish views for others of an interesting character, of animals preferred.—Harris, Wholesale Stationer, Plymouth.

Will exchange 10 slides of Durham for 10 of English or Scotch Lake District.—Walton, Beechwood Street, Sunderland.

## Sale and Exchange.

**RULES.**—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

**REPORTING UPON APPARATUS.**—The Editor of the AMATEUR PHOTOGRAPHER will be pleased to report, to any intending purchaser, upon apparatus, etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the seller to him to the offices of the AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending buyer to pay a fee equivalent to a commission of 2½ per cent., the minimum being one shilling, upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the seller. As far as possible, the Editor will undertake to send a report within TWO DAYS of receipt of goods.

### DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

Advertisements can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 6d. to cover postage.

**N.B.**—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

"Amateur Photographer," 151 numbers, from 170 to 327, seven missing, also seven odd numbers; for cash, or good selection stereoscopic slides.—E. D., 20, Pepys Road South, New Cross, London.

"Amateur Photographer," etc.—AMATEUR PHOTOGRAPHER, Nos. 260 to 325; "Photography," Nos. 35 to 111, not sold; will accept first reasonable offer.—Holder, 9, Cornwall Terrace, Charlton, Kent.

**Banjo.**—Banjo, 5 strings, beautifully plated hoops and fittings, inlaid handle, ivory keys, grand tone, in splendid condition, leather case, suit lady or gentleman; cost £5 10s.; price 55s.; approval.—H. Baker, 2, Acree Lane, Brixton, S.W.

**Cameras.**—Fallowfield's Facile, cost £4 4s., in first-rate condition; take £3, or offers.—No. 89, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

**Cameras, etc.**—Lancaster's half-plate 1889 Instantograph camera and three double backs only, with waterproof case, all in good order; £2 10s.—A. Spiller, Hillside, Hampstead Hill Gardens, N.W.

Lancaster's Instantograph quarter-plate, perfect, 1890 pattern, six double dark-slides and tripod, no lens; what offers?—George Jackson, 9, Barton Avenue, Urmston, Manchester.

**Cameras, Lenses, etc.**—1890 Lancaster's Instantograph camera, slide, tripod, 7 by 5 R.R. lens, new, 67s. 8d.—R. Henry, 2, Hawthorn Villas, Slad Road, Stroud, Glos.

Optimus half-plate set, long extension square camera, and four double backs; two lenses, 7 by 5 Euryscope and wide-angle; tripod, and leather and canvas cases, nearly new, only used a few times; price £12 10s.—M., 28, Mount View Road, Stroud Green, N.

Quarter-plate portrait lens, 8s.; half-plate landscape ditto, unmounted, 3s. 6d.; quarter-plate Pocket camera (by Rouch) and 6 double backs, 50s.; Adams' Ideal hand-camera, new, £5; 8½ by 6½ rapid rectilinear lens, £2.—Franklin, Station Road, Rickmansworth.

**Developing Tents.**—Marion's square shape, complete with table and sink, cost £4 4s., take £2; Rouch's, complete with tripod, take £2.—No. 89, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

**Hand-Camera.**—Swinden and Earp's quarter hand-camera, perfect, new in August; £5.—Walton, Churchtown, Southport.

**Hand-Cameras, etc.**—No. 3 Kodak, reg. new, bought direct 30th December, loaded with 60 exposures, less six, the only exposures made by it, perfect order; cost £3 7s. 6d.; will take £6 10s. nett.—No. 91, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

**Lantern.**—Mahogany lantern, 4 in. condensers, four-wick lamp, new; cost £4 10s.; price £3.—Edwards, Telegraphs, Belfast.

**Lenses.**—Ross' half-plate rapid symmetrical lens, with diaphragms, complete; £4; bargain.—Barton, Morriston, Elgin.

Quarter Euryscope, f/8, R.R. lens, as new, 19s. 6d.; 7 by 5 R.R., working at f/3, 21s., with Waterhouse stops.—John Slade, Slad Road, Stroud, Glos.

Vevers' quarter rectilinear, 14s. 6d.; ditto half-plate view lens, 7s. 6d.—T. Hall, Pinfold Lane, Lancaster.

Rapid rectilinear lens, half-plate, guaranteed in very finest order, covers plate well to edges, fine definition, moveable hood, Waterhouse diaphragms; take 27s. 6d.; approval.—C. Thurlow, 23, Gotha Street, Victoria Park.

Whole-plate single landscape lens, Iris diaphragm; 17s. 6d.—Walford, 30, Nutfield Road, East Dulwich.

Optimus 7 by 5 rapid rectilinear lens, f/3, a really fine lens for instantaneous effects, covers plate well and very fine definition; approval; take 37s. 6d.—Graham, 119, Willmott Street, Bethnal Green Junction.

**Lenses, etc.**—Very fine R.R. lens, half-plate burinisher, perfect, 22 whole-plate views of Holy Land.—W. Jones, Enfield House, Uffculme, Devon.

Rapid quarter view lens, f/8, with instantaneous time pneumatic shutter; 10s. 6d.—George, 5, Melita Villas, Victoria Road, Charlton.

**Negatives.**—Box quarter-plate negatives, suitable for lantern slides; will lend them.—James Brynkrug, Towyn, Merioneth.

**Sundries.**—Set of brass fire irons, full size, very pretty pattern, suitable for dining or drawing room, nearly new; cost 15s.; price 8s. 6d.; approval.—A. Henry, 4, West Brixton, S.W.

House, well-built modern 8-roomed, for sale, good neighbourhood, handy rail and bus to City, bath, hot and cold water, also dark-room for amateur photographer, sink, water laid on.—Blackmore, 1, Coulter Road, Hammersmith.

## WANTED.

**Cameras, Lenses, etc.**—Good quarter-plate or 5 by 4 camera, by Meagher, Perken, Son, and Rayment, or equal maker, long extension, square bellows, reversing back, all useful movements (brass-bound preferred), one or more double slides, and 5 by 4 Optimus rapid rectilinear lens, by Perken, Son, and Rayment; approval; no dealers.—Full particulars to No. 90, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Stereoscopic camera, pair of lenses, slide, wanted. Four-wick Ramphengos lamp, Kodak, or offers.—Bewley, North Road, St. Helens.

Wanted to purchase, second-hand cameras, lenses, and photographic sundries, for prompt cash. Immediate attention given to all correspondence.—Amateur Photographic Depot, 71, Oxford Street, Manchester.

Whole-plate camera, slides, R.R. lens, tripod.—Patrickson, 28, Burton Terrace, Dewsbury Road, Leeds.

6½ by 4½ square bellows camera, by Watson (Premier), with three or six slides, Dallmeyer's W.A. and R.R. lenses, complete; exchange with cash to value or sell, Thornton's patent 10 by 8 camera, three slides, all improvements, Ross' 10 by 8 rapid symmetrical, waterproof canvas cases, tripod; cost £25.—Particulars to Walton, Churchtown, Southport.

Half-plate camera, rapid rectilinear lens, tripod case, etc., complete; lowest cash on approval; no dealers.—Mrs. East, Queen Street, Louth, Lincs.

Half or whole plate camera and portrait lens; exchange jewellery or cash.—Heyaside, Oldham.

**Enlarging Lantern.**—Lancaster's enlarging lantern, 5 in. condensers.—Freeman, 100, Dalling Road, Hammersmith.

**Hand-Camera.**—Facile hand-camera, good condition, cheap; approval.—Frederick Firth, Woodsey House, Leeds.

Facile hand-camera (with R.R. lens), or Swinden and Earp, must be perfect, and reasonably cheap.—Geo. Waller, 3, Middlegate Street, Gt. Yarmouth.

**Lenses, etc.**—Set, half or whole plate modern R.R. or other good lens, also half-plate burinisher; approval, and no rubbish.—Hounsoms, 21, Francis Street, Reading.

**Magic Lantern.**—Magic lantern, 3½ in. slides.—Lowest price to S. Kirkham, Court Place, Carlisle.

**Set.**—Second-hand photographic apparatus, complete; state original cost; full details.—Douglas, 69, Blenheim Crescent, W.

**Sundries.**—To amateur photographers. Wanted, set of photographs of Thames scenery from Oxford to London, with right to publish in book of views.—For particulars apply to Farrer and Sons, Booksellers, Reading.

## OUR VIEWS.

"To hold as 'twere the mirror up to nature."—Shakespeare.

[Members of the Editing staff are "At Home" on Monday afternoons from Two till Five o'clock, and they will gladly give advice upon all photographic matters.]

WE would call our readers' attention to the fact that two ladies who are practising photography for a livelihood are sadly hampered by the want of a hand camera. Perhaps some of our friends may be able to assist them.

THERE is a very interesting series of Alpine photographs on view in the Public Art Museum, Bradford, and they are attracting much attention. They consist of sixty-seven views taken by Mr. Alfred Holmes, and of them the *Bradford Observer* says:—

"They are at once a tribute to Mr. Holmes' skill in photography and his powers as a mountaineer. His camera seems to have been taken into all sorts of impracticable-looking places, and the result is a series of excellent photographs, some valuable for the facts of mountain form which they record, and others for the charmingly selected views which they represent. Among the former are large ones of mountain summits and *aiguilles*, as well as many smaller ones, all very clear and precise in the rendering of details. The latter include some charming little pictures, of which the Matterhorn, near Zermatt, is one of the most beautiful and delicate. There are also two or three photographs from our own Cumberland mountains."

THE M'Kinley Tariff Act has had some effect on photographic chemicals imported into the United States. There were reductions made on iodine and potash salts, whilst the duty on mercurials and chromates was increased.

LAST week a meeting of amateurs was held at Ilkeston, when the Ilkeston and District Photographic Society was formed. The first President is Dr. Carroll, and the Hon. Secretary, Mr. W. Shakespeare, jun.

SHORT, very short, exposures are the order of the day, and claims have been made which have astonished practical photographers, but last week a contemporary gravely announces that Mr. Masey, who has recently been devoting himself to photographing fishes, has made exposures of "from one-two-thousandth to the one-three-thousandth part of a second!" We should hardly think so short an exposure was necessary to catch a squid jumping out of the water, or even the undulating fins on the edge of a ray's body. Is it

not possible that a figure or two got added during the travels of the story from Mr. Masey to the columns of our contemporary?

IN answer to numerous correspondents who have written to us on the subject, and in deference to the earnest desire of many of them, we have determined that *noms de plumes* shall be admissible for publication in answers in the Quarterly Examination, though, of course, the full name and address of the competitor must also accompany the answer.

AMATEUR photographers when on their travels must be careful in selecting their views, as military authorities are very touchy about localities under their charge. The latest victim of excessive zeal in this connection is Mr. Davis, chief engineer of the *Benbow*. He was "taking" the Selema Creek, when a sentry advanced, peremptorily ordered him to desist, and demanded the officer's written permit for indulging in his harmless amusement. This not being at hand, Mr. Davis produced his card. At this juncture the field officer of the day came up, and ordered Mr. Davis's arrest. The votary of the camera was thereupon marched off to the guard-house, and, though he was not long detained, he had to pay by some slight inconvenience for his passion for the arts. It does look very much like over anxiety when an officer of one of Her Majesty's vessels is arrested for photographing in part of Her Majesty's possessions.

WE have received from Mr. W. H. Kitchen (Cardiff) a photograph of the ceremony of opening the Clarence Bridge, Cardiff, recently, by H.R.H. the Duke of Clarence. The photograph is an enlargement from a quarter-plate hand-camera negative. The portrait of his Royal Highness is admirable.

MR. A. C. FORSTER, of Eaton Rise, Ealing, sends us the following extract from a book published in 1849, which we have pleasure in giving, as it may be of interest:

"Professor Schoenbein, who invented the gun-cotton, is stated in the *Revue Scientifique et Industrielle* to have to a certain point discovered malleable glass! He renders paper paste (*papier-maché*) transparent by causing it to undergo a certain metamorphosis, which he calls catalytic for want of a more intelligible term. He makes of this new paper, window-panes, vases, bottles, etc., impermeable to water, and which may be dropped on the ground without breaking, and are perfectly transparent."

THE question of electric action in films has been raised on several occasions, and the makings seem now to have been obviated by the manufacturers, but in that connection the experiments of Franz von Dobrzynski, of Vienna, may be of some interest, and lead to some experiments on the subject being made in this country. Speaking of his experiments, Herr von Dobrzynski says :—

“I have for several months been engaged in investigating the photographic action of electro-magnetic waves. The electro-magnetic waves were obtained by the method of Hertz. They acted on dry bromide of silver and gelatine ‘Nys’ plates procured from Geissler in Bonn. The plane of the plates either included the axis of the vibrator, or was at right angles to it. The exposure was three hours. No sensitisation of the plates was made. The development and fixation took place in the ordinary manner by ferric oxalate and hyposulphite. The action was visible after development and fixation by the appearance of alternating bright and dark bands across the direction of vibration of the waves, or by the appearance of dark bands in the direction of the vibration. Both kinds of bands could occasionally be observed together. In many experiments the plates were covered with tinfoil. Portions of the coating of the tinfoil were cut away. The tinfoil did not prevent the formation of bands. This points to the fact that the chemical action which here comes into play is not a primary one. The cross bands suggested stationary vibrations. They might be due to reflexion from the sides of the wooden box, by which the plates were protected from the influence of extraneous rays; but they might also owe their origin to reflexion from the side of the room. The only experiment which could be made with a reflecting metal ball was not in disagreement with this view; the cross bands were now more distinct and regular. If this view is correct, it may be concluded that waves of from 0.6 to 20 centim. are effective

—+\*+\*+—

ON Wednesday last week, the Edinburgh Exhibition was closed, and with, we are sorry to say, a balance on the wrong side of the accounts. This is the more to be regretted as it opened with a most promising prospect, and no doubt would, but for unlooked-for circumstances, have proved all that could have been desired. The bad weather, the railway strike, and a gigantic bazaar held in the town during the run of the Exhibition (securing £15,000) were all against the success of the venture. We must, however, express the hope that the next Edinburgh Exhibition will have good weather, and no strikes or giant bazaars running at the same time, and express our thorough sympathy with the guarantors, who will be called upon to make the accounts balance.

—+\*+\*+—

WE have recently had fitted in our offices, for judging purposes, one of Dyson's opaque screens, and we must say that we have not seen a better or more effective one in the course of our experience, and we would recommend those of our readers who purpose providing themselves with a screen to pay a visit to Mr. Dyson before purchasing.

—+\*+\*+—

MR. W. T. TUCKER, of Herrick Road, Loughborough, writes to us to the effect that there is now room for six members in the Lantern Slide Exchange Club, the conditions of which are that the member must be an amateur photographer, send in one slide per month, and pay a yearly subscription of one shilling. Mr. A. R. Dresser is the hon. critic of the Club.

—+\*+\*+—

WE would draw our readers' attention to the “Wanted” advertisement referring to loan of negatives. The negatives are wanted to make slides for use in connection with a mission. We hope some of our readers will be able and willing to assist.

THE question of an International Exhibition of Photography, to cover all the branches of the art-science, to be held in this country, is one worthy the attention of all amateurs and of professionals also, as in such a complete Exhibition there would be not only specimens of the best amateur work on view, but samples of the best professional work to be obtained in all parts of the world, and not only a collection of apparatus, connected with the first processes, but machinery in work illustrating the various processes of reproduction which can be used in illustrations and so on. That such a complete exposition of the various departments of photography has not yet been seen in this country will be generally admitted, and even those exhibitions abroad which have professed to have a scope almost as wide have not by any means filled the bill. Under these circumstances, and considering how great would be the educational value, not only to photographers but to the public generally, of such an undertaking, it is only reasonable to assume that if an attempt were made to bring it to a practical issue it would be widely and strongly supported, the more so as there could be no rivalry, except to show the best work, amongst the various schools which are now distracting the photographer's view. All these styles and methods would stand on an equal footing, and the public would be able to judge for itself as to their relative merits. This point alone is of considerable weight when urged in favour of a world-wide exhibition, for, after all, the public will be the final judge of the artistic virtues put forward by the disciples of either new or old schools, and on its verdict will rest the future survival or dissolution of any of them. Of course, there are many other points to be brought forward in support of those who favour the idea of an International Exhibition of Photography, and for a clear and moderate statement of the case, we cannot do better than refer our readers to Major J. Fortune Nott's article, in the January number of the *Photographic Quarterly*, on “A Proposed International Exhibition of Photography.” The writer of the article, in conjunction with Mr. Maskell, has worked out the details of the scheme and carried it so far that a small but influential Committee has been formed and has already met on several occasions to discuss the desirability and practicability of holding such an Exhibition, so that we may safely say that the foundation stone of the edifice has been laid, and that now is the time for those who feel an interest in the matter and are prepared to do their best to assist towards its ultimate success, to come forward and strengthen the hands of those gentlemen who have discussed, and to some extent drawn up, the outline of a scheme which should receive the hearty support of photographers all the world over. We recommend the following concluding words of the article to the consideration of all those to whom our remarks appeal:—“Of course, there are difficulties in the way, and so there have been in connection with every enterprise of a similar nature; but there are none that cannot be conquered if the enthusiasm of the vast army of photographers, professional, scientific, and amateur, can be aroused on its behalf. The two principal obstacles to be overcome before such an enterprise can be launched are the securing of a suitable site, and the procuring of a guarantee fund to which subscribers of good standing have signed for an amount ample to protect those who become responsible for the initial outlay. Once these two matters are satisfactorily arranged—and they are by no means insurmountable, or if they were no exhibitions would ever be held—all other arrangements would be comparatively easy; and if this one has for an ulterior object the providing funds by the donation of its profits towards the foundation of a Photographic Institute, we venture to assert that our brethren with the camera will do their utmost to further

the scheme of an International Exhibition of Photography, and in that event its success will be assured."

### THE CAMERA CLUB.

In our leading article in last week's number, under the above heading, we stated that the subject being one of considerable interest in amateur photographic circles, we should supplement in a future issue the remarks therein made. In accordance therewith we now fulfil our promise.

As before stated, the Camera Club is a unique institution in many particulars, and its prosperity and rapid rise in popularity are distinguishing features of its comparatively short career, which give the history of the Club a more extended importance than it might otherwise possess. In the numbers of this journal issued during the months of April, May, and June, 1885, the various suggestions made by some of the leading amateurs of the day regarding the necessity for a club or association devoted to the interests of photographers can be read, and with the light of existing circumstances it is amusing to see the modesty of some of the proposals made regarding the scope and limits to which it should be confined. No writer apparently foresaw prosperity, and all are timid when the question of expense is on the tapis, one gentleman even suggesting that an annual exhibition of photographs would be impossible owing to the expense thereof necessitating a larger outlay than the exhibitors could afford. Other questions were also discussed, and difficulties appeared to spring up like mushrooms; for even the situation of the proposed club was not settled without trouble. A lady entered the field, and accused Mr. W. A. Greene of trying to strangle the Club at its birth by making the suggestion that it should be located in some street on the south side of the Strand, and have three rooms. She also foretold dire disaster if the social question involved in the idea of a Club was allowed to prevail. It is to be hoped that this lady's photographs turn out better than her prophecies, for the Association was established as a club, and was domiciled in three rooms in a street off the Strand, Mr. Greene's suggestions being carried out in every particular, except the one that the street should be on the south side, for Bedford Street, the one ultimately chosen, is situated on the north side. It is only another case accentuating the good quality of the advice contained in the remark that we should never prophesy until we know.

The first meeting of the gentlemen who had agreed to take an interest in the Club, assembled at the offices of this paper on the 20th May, 1885. From the number of letters then read, emanating from well-known amateur photographers who approved of the plan and promised it a cordial support, the establishment of the Club was found to be feasible; a start was therefore given it by the appointment of a working committee and the formation of a guarantee fund by which the preliminary expenses were provided, or rather their recoupment assured.

By circular and other means the gentlemen acting on this committee soon procured applications for membership sufficiently numerous to justify them in securing a local habitation for the Club, and what was more to the purpose, in five or six weeks after their appointment they were able to announce the fact that they had enough of the required capital subscribed to warrant them in ordering the furniture and fitting-up a dark-room in a much more luxurious manner than was originally anticipated. This committee completed its work on the 14th November, 1885, when, under the presidency of Captain Abney, the Camera Club was formally inaugurated and started on its career with a very successful conversazione, at which the rooms were crowded. There were 164 members then on

the roll, and they had supplied a guarantee fund amounting to £500. With this comparatively small following a club that has had an almost phenomenal success was formed upon lines and rules which have been followed with more or less fidelity ever since. And now five years later the Club numbers nearly 700 members, and has a balance at its banker's sufficiently large to justify it in procuring and furnishing a building in a central position wherein every possible requirement of a social club will be supplied, in addition to those which enthusiastic photographers also find indispensable.

For this social and financial success the Club is greatly indebted to the shrewd business capacity characterising the majority of those members who have from time to time served upon its committees, and also perhaps in a greater degree to its Honorary Secretaries and Managers. The Club has required able steering through certain shoals it has encountered, and fortunately when difficulties have arisen it has had reliable pilots. Herein lies one of the principal secrets of its prosperity, and we draw attention to it because it may point to weak spots in other societies or clubs, and a profitable lesson can be acquired by an investigation into the working history of the Camera Club. This Club was made into a joint-stock company soon after its inception, but the original company had not a large enough capital or powers; in consequence it was lately wound up and replaced by another one with articles of association formed expressly to suit its needs.

In its social aspect also may be found certain features that can serve as useful models for other clubs and societies. Amusement and its concomitant result, that desirable good fellowship amongst the members which must of necessity make any club more or less popular, is provided by monthly smoking concerts, for which, so far, a programme has always been provided that has succeeded in filling all the available room which has been at the disposal of the Club. Then the scientific or technical education of the members in photographic matters has been fostered by the encouragement of discussions following the reading of papers on Thursday evenings during the winter months by members and others, upon subjects with which they are especially acquainted. The Club has in this way done a great deal of good, and its proceedings have had a very wide interest, for many men noted in science and art as investigators or masters in certain departments have given the Club at these Thursday meetings the benefit of their experiences. A proof of the advantages accruing from the method adopted by the Club to interest its members in the scientific and artistic branches of photography is found in the fact that several of them are now prominent as leaders in certain sections of photographic work, and are ruling spirits in guiding the advances that have and are still being made in the fascinating art.

Once a year the Club holds a Conference of scientific men in the hall of the Society of Arts, at which anyone interested in photography is welcomed, and most able papers have been read thereat. By exhibitions of members' work, evenings devoted to that enjoyment to be derived from the use of the projecting lantern, and in various other ways, the members are kept entertained during the dull seasons of the year. In the summer-time excursions are arranged to certain picturesque or historical places for photographic purposes, and in this way the members meet each other under circumstances that promote friendliness.

For the Club evidently recognises the fact that it is only by such means that unity of purpose and intent can be secured, and in this unity lies that power for good which the Camera Club possesses. It is to be hoped that it may also shortly recognise the fact that this power can be em-

ployed in a much more extended manner than has hitherto been possible, for it can now hardly be gainsaid that some such central power is a *desideratum* of photographic circles, because by its ruling many of the divided interests and opinions that now prevail upon several subjects of importance to the followers of the art-science would receive definite settlement. In this direction the Camera Club, as representing the largest and most influential body of men interested in photography now existing, could, if it chose, make its power one of paramount importance.

## Letters to the Editor.

### PHOTOGRAPHIC ART TENDENCIES.

SIR,—In replying to Mr. George Bankart's letter in reference to my lecture to the West Kent Amateur Photographic Society, I have nothing to find fault with, unless it be the excessively high opinion that gentleman has formed of my teaching, and which he has so courteously expressed; to this I can only say I meant well, and meant all I said. I have to thank Mr. Bankart, however, for pointing out that I did not say quite enough, or still worse, did not express quite clearly all that I intended. Addressing amateurs on photographic art tendencies, I almost based my text on the recent exhibitions, where the tendency in printing is certainly not to autotype, but to platinotype or bromide. Mr. Bankart will probably smile when I tell him I looked upon autotype work as out of the range of most amateurs. Very possibly I do not know all its advantages, which may, and, as he says so, does no doubt supply the gradation of tones I miss in the platinotype and bromide prints. I must be understood, however, as making a contrast between these and albumen prints only, in range of tones, I looking at these three processes as ordinary to the amateur.

In regard to negatives, I quite agree with Mr. Bankart, for although, as I say, I am no photographer, but an outsider, I have worked the old wet-plate process almost as long as he has done, and endorse every word he has said in its behalf, and have even gone so far sometimes as to remark to an amateur—much to his disgust—that those who have never used collodion know nothing about photography.

Where I was wrong in my lecture—and I now see I was very wrong—was to think for a moment that simplicity of means should necessarily lead to excellence in art. I will therefore, Sir, eat my words, and look no more for too high a standard in these touch-and-go times, allowing that those who have not the *longue haleine* will do little in art. In reference to detail, I must assure Mr. Bankart that I do not like it microscopic, but moderate definition in the foreground planes, as I explained at the Society of Arts, on the 17th ult., at Mr. Davison's lecture (see Journal).—Yours, etc.,

PHILIP H. NEWMAN.

January 6th, 1891.

\* \* \* \*

### MR. GRATSCHEFF.

SIR,—In your issue for Friday, December 19th, a slight error has been made with regard to the office held by Mr. V. Gratscheff in the Imp. Russ. Tech. Society. The presidential chair is filled by His Excellency M. M. Descheroff. Although Mr. Gratscheff obtained many votes for the presidency, his official duties in connection with the Ministry of Ways and Communications deterred him from accepting the same. He is, however, a member of the Council.

As your assertion might lead correspondence into the wrong channel, I beg of you to make the necessary alteration in an early number of your publication.—Yours truly,

C. T. CHESTERMAN.

\* \* \* \*

### PHOTOGRAPHIC TONALITY.

SIR,—Your paper is always eagerly watched for on Thursday night, and I never fail to obtain several hours' enjoyment in reading every word, and there is hardly a page which does not contain some useful and instructive lesson. I was, however, sorely exercised as to the meaning of the article (Jan. 2nd) by Mr.

T. L. Buck under the above title. In the first place, Sir, allow me to inform you that I am not a member of the "Photo-aesthetic-naturalistic-impressionistic-fuzzigraphic Club;" therefore I was obliged to turn to a much-read work for the meaning of the word "tonality," and found (Dr. Emerson's "Naturalistic Photography," p. 26) that "the correct meaning of tone is the amount of light received upon the different planes of an object." Thus, having got hold of what may be the meaning of tonality, I again read the above article, and should be very much obliged if Mr. Buck will give a little help to a seeker after truth in "tonal values."

Of course, I agree entirely with the first two paragraphs; the third made me scratch my head and think; the fourth paragraph, about development, made me light my pipe, put my elbows on the table, and think how much to blame I must have been to work for so long in such a stupid way. On concluding the article, however, I began to doubt the truth and logic of the arguments, and finally ended in a big maze of doubt and dismay. In the second paragraph Mr. Buck says: "I freely admit that we labour under a great disadvantage, so far as regards the ordinary dry-plate, which is not corrected for colour, seeing that it is so much more sensitive to the blue than the red end of the spectrum;" and again, further down, he says that slow development produces a wretched tonality by allowing those parts of the plate "acted upon by the blues and greys to gather a density out of all proportion to their tonal value, and keeps the very parts of the plate least acted on, i.e., by the reds, yellows, etc." from having the energetic accelerating they need, etc. Then he tells us to "cut exposures short" and use a developer with energetic accelerator. Now, Sir, Dr. Emerson: "Develop slowly," and again, "Develop all plates slowly, as the student has far more command over his work."

If, as we must all admit, the blues act more energetically than the reds and yellows, we shall require to give a much longer exposure to the latter to get their true tonal values, yet Mr. Buck says, "Cut exposure short," so as to get true tonal values. And again, short exposure tends to increase of contrast or actually to decrease of gradation, because the lower tones of the subject are unable to impress their image upon the sensitive film, and the resulting pictures are hard and too black and white, no matter what method of development is used, whilst over or full exposure tends to a far softer and more harmonious gradation, when carefully developed.

The letter by "Isis," in your issue of 9th inst., seems to me to be utterly without point so far as his example goes, it only proves that his friend knew absolutely nothing about development, and had got hold of the rule "Develop slowly, adding your accelerator by degrees," and totally disregarded the equally important rule, "Use your brains." The subject given, "a striking and somewhat dark foreground," with a bright distance, is one in which there is an extreme contrast, which is accentuated by the sensitive salt of silver, and therefore a method of development must be adopted which will reduce contrast, and this can only be done by the use of brains in exposure and in development. To take an analogous subject, which may be met with any day just now, viz., a mass of black in the foreground with white snow in the middle and far distance, we have here a subject in which there is infinitely less gradation than in the view mentioned by "Isis," but surely the "use of brains" would tell anyone to give a long exposure so as to obtain detail in the black foreground, and let the high lights or bright distance take care of itself. Now we want to reduce contrast, consequently we reduce the oxidising agent and increase the accelerator as pointed out in your leading notes on snow scenes. I may be wrong, Sir, and I shall be glad to have my errors pointed out by "Isis," or Mr. Buck. Till they convince me, however, that I am wrong, I shall continue to develop slowly and use my brains.—Yours, etc.,

GRADATION.

\* \* \* \*

**Mending Vulcanite or Ebonite Trays.**—These exceedingly handy but somewhat fragile dishes may frequently be made serviceable, when not too badly broken, by the use of Proutt's elastic glue, a stick of which may be purchased at any shoemaker's furnishing shop for one penny. The pieces should be placed together, and the glue applied like sealing-wax over the join outside as well as inside. A knitting needle heated in a gas flame will be found useful in spreading the wax neatly. The writer has in his possession and constant use a tray which was broken five years ago, and which has been mended over and over again in this way.

## The Universal Developer.

### THE ILFORD HYDROQUINONE FORMULA.

THOSE of our readers who have the AMATEUR PHOTOGRAPHER for 1888 and 1889 will find numerous communications about hydroquinone, and also the expression from many a worker that it would be "the developer of the future." The introduction of eikonogen, however, called off to some extent the notice of amateurs from hydroquinone, although many operators and experienced hands still adhered to the latter for lantern work and bromide papers. Many of the disadvantages ascribed to this reducing agent were caused by ignorance of the best method of using it, and also from unsuitable formulæ for its preparation.

To the practical worker who cares but little for experimental and theoretical photography, but looks more to obtaining successful results from every exposure, and artistic prints from his negatives, the simplification of formulæ and reduction of the necessary stock solutions—which, speaking from our own experience, have a great tendency to accumulate—come as a perfect boon. The formula just issued by the Britannia Works Company for their well-known "Ilford" preparations is simplicity itself, and has been worked out in the form of two solutions, as follows:—

No. 1.			
Hydroquinone	..	..	160 grains.
Bromide of potassium	..	..	30 "
Sulphite of soda	..	..	2 oz. (avoir.)
Water, to	..	..	20 "
No. 2.			
Soda hydrate	..	..	100 grains.
Water, to	..	..	20 oz.

The directions for use, too, are extremely simple, and hardly likely to be bungled over by the veriest tyro:—

- For "Ilford" negative plates use equal parts of Nos. 1 and 2.
- For "Ilford" bromide papers, use one part No. 1, one part No. 2, one part water.
- For "Ilford" Alpha paper, use one part No. 1, half a part No. 2, two parts of water.
- For "Ilford" Special lantern plates (for black tones), use equal parts Nos. 1 and 2.
- For "Ilford" Alpha lantern plates (for warm tones), use one part of No. 1, half part No. 2, two parts of water.

We venture to add the following notes on the above which may be taken as applying to all hydroquinone developers.

In the case of over-exposure, it is advisable to add a few drops of a 10 per cent. solution of bromide or a few drops of acetic acid, or for landscape work where over-exposure is suspected, development should be commenced with an old once-used developer, and then when all the details are out, the old developer should be poured off and a fresh unused developer applied. It is very curious that increase of the hydroquinone or increase of the accelerator seems to have but little effect on the final result; though increase of the accelerator or No. 2 solution causes development to be more rapid, and increase of the hydroquinone and lessening of the alkali tends to produce more delicate details in the high lights, and the development is slower and more under control. With many plates a peculiar grey surface fog is apparent when using hydroquinone, especially when using fresh solutions, but this fog almost entirely disappears in the fixing bath and is harmless in printing. On the Continent the use of the acid fixing bath is almost universal after hydroquinone, and its action, which is that of tanning,

hardening, and clearing the film, is certainly beneficial. There is one important point which must not be disregarded, and that is, the colour of the reduced silver image is a grey black, and consequently less non-actinic than the brown deposit caused by pyro.

We have tried the formula as recommended above for the new lantern plates (see AMATEUR PHOTOGRAPHER, December 29, 1890, page 457) and for the bromide paper with excellent results, the image in each case being a pure black, with no tendency to rustiness or blocking up of the shadows. In making the solution of hydroquinone, it is advisable to dissolve the sodium sulphite in the water, and then add the hydroquinone last.

## Reviews.

*The American Annual of Photography* (New York: The Scovil and Adams Co.)

This old friend of photographers is once more to hand, and keeps up its character of being one of the best printed and got up annuals to be purchased. The articles are as numerous and interesting as ever, and there are as usual plenty of illustrations, though it is to be regretted that, with the exception of two, they are all process-block reproductions. The chief article, and the one which will probably excite the most interest, is "Portraits of Daguerre," which is illustrated by no less than eleven different portraits of that great discoverer, one from a daguerreotype by C. R. Reade, now in the possession of Mrs. S. M. Valentine, having never before been published. There are two very good reproductions of photographs of lightning, one giving distinctly the dark lighting about which there has been so much discussion since photography first showed it. Another illustration, a nice piece of composition, shows three children in an old boat which is high and dry on the grass; they have rigged up a mast and sail, and one sits in the stern with a spade for a rudder, while another manages the sail, and the third is fishing over the side. The title of the picture is "Sailing the High Seas Over." The articles range over all the topics connected with photography—from "A Trunk for Photographic Tourists" down to "A Plea for Imperfection." In the latter article Mr. F. H. Wilson says:—

"The brush and the pencil are amiable wanderers, only too vague in our trembling hands. But the camera is an instrument of precision with an inclusive grasp. Its tendency is to give you a lot for your money; and if it is not judiciously repressed, it will make the summer woods look like one bewildering scatterment of detailed leaves, and will reproduce the peachy cheek with the texture of cork and the speckles of the sparrow's breast. It is too powerful for picture-making at its full force, for there must be a little mystery about art; its forte is really, when the perfected lens is focussed mercilessly and stopped down, the scientific diagram, not the artistic picture. Its tremendous truthfulness is exceedingly valuable in its way, but it must be a trifle tempered where some trace of pleasantness as well is desired. Focus is perhaps the main point—this including the abuse of small stops. Many a picture would have been a very pleasing thing to look at—composition, lighting, subject, all good—if the fiend at the photographer's elbow had not suggested an extra turn towards accuracy of the focussing screw, and then slipped the smallest stop into his hand to complete the ruin. The ideal position of the lens is about that where a good hand-camera worker usually carries his—at neither extreme, where there is the maximum of depth, with nothing too sharp at any one plane of the field."

Amongst workers of this country who have contributed articles are Messrs. W. K. Burton, C. H. Bothamley, A. R. Dresser, W. J. Harrison, A. Pringle, and J. Traill Taylor.

## Composition, and Light and Shade.

*Selected and arranged for the use of Photographers, from "Burnet's Essays," with Introduction and Notes.*

By H. P. ROBINSON.

### CHAPTER II.

"COMPOSITION is the art of arranging figures or objects, so as to adapt them to any particular subject. In composition four requisites are necessary;—that the story be well told; that it possess a good general form; that it be so arranged as to be capable of receiving a proper effect of light and shade; and that it be susceptible of an agreeable disposition of colour. *The form of a composition is best suggested by the subject or design, as the fitness of the adaptation ought to appear to emanate from the circumstances themselves: hence the variety of compositions.*

The point of time being fixed upon, the action, expression, and incidental circumstances oblige us often to determine on a particular arrangement, that we may be enabled to place the most interesting objects in the most prominent places. Unless our attention be directed to such arrangement in the first instance, we shall often be obliged to put an emphasis on an insignificant object, or throw into repose an interesting point of the action, when we come to consider their relation to a good effect of light and shade.

To secure a good general form in composition, it is necessary that it should be as simple as possible. A confused complicated form may hide the art, but can never invite the attention. Horace, in his Art of Poetry, inculcates the same doctrine, "*Denique sit quod vis, simplex duntaxat et unum.*" Whether this is to be produced by a breadth of light and shade, which is often the case with Rembrandt, even on a most complicated outline, or by the simple arrangement of colour, as we often find in Titian, or by the construction of the group in the first instance, evident in many of Raphael's works, must depend upon the taste of the artist: it is sufficient to direct the younger students to this particular, their minds being generally carried away by notions of variety and contrast.

In giving a few examples of composition, I have confined myself to the four simple and principal forms; not only from their being most palpable, but also from their possessing a decided character, which is at all times desirable. To those who imagine that such rules tend to fetter genius, I shall merely quote Sir Joshua Reynolds, whose works, if properly understood, render all other writings on the subject of painting superfluous,—"*It must, of necessity, be, that even works of genius, like every other effect, as they must have their cause, must likewise have their rules; it cannot be by chance that excellencies are produced with any constancy or any certainty, for this is not the nature of chance; but the rules, by which men of extraordinary parts and such as are called men of genius work, are either such as they discover by their own peculiar observations, or of such a nice texture as not easily to admit being expressed in words; especially as artists are not very frequently skilful in that mode of communicating ideas. Unsubstantial, however, as these rules may seem, and difficult as it may be to convey them in writing, they are still seen and felt in the mind of the artist; and he works from them with as much certainty as if they were embodied, as I may say, upon paper. It is true, these refined principles cannot be always made palpable, like the more gross rules of art; yet it does not follow, but that the mind may be put in such a train that it shall perceive, by a kind of scientific sense, that propriety which words, particularly words of unpractised writers such as we are, can but very feebly suggest.*" *Sixth Discourse.*

To assist in putting the mind in such a train is all that these examples aim at; and to render apparent to the young artist what he will find wrapped up in theoretical disquisition.

The specimens here given merely happened to be in my possession: there are many others that will serve the student, perhaps better, for illustration, which he ought by all means to procure, or make sketches of, as it is only by rendering himself master of the subject, that he can hope to avoid the commonplace effects which swim upon the surface, and, being palpable, are adopted by every one whose judgment cannot carry him into the intricacies of the art.

Concealing the art is one of its greatest beauties; and he best can accomplish that who can discover it under all its disguises. I ought, however, to caution the young artist on this head, not to be too fastidious in trying to conceal what can be obvious only to a small number; for, in endeavouring to render his design more intricate, he may destroy character, simplicity, and breadth; qualities which affect and are appreciated by every one."

Nothing could be more simple, clear, and condensed than the way in which Burnet states his case for composition, its objects and elasticity. This will be found to be characteristic of his writing throughout. He points out that in a pictorial composition (1) the story must be well told, that is, that the artist must have a meaning in his work, and the intention should be evident; (2) that the composition should be arranged in a good general form; and (3) that it should admit of a pleasing effect of light and shade. He adds a fourth necessity which photographers may regard as a negligible quantity, namely, that it be susceptible of agreeable colour.

It is becoming the fashion with those who appear to be deficient in imagination to deride the pictorial representation of a story and to contemptuously call such pictures "literary art." One recent writer has even gone so far as to say that art is lost as soon as it is given any moral or direct didactic aim. A reply to this fallacy is not necessary, or it may be pointed out that if it were true then painters of all ages have been absolutely wrong. It is also sometimes objected that any rules for the arrangement of the forms, and, as it must follow, any selection according to the best accepted arrangement of forms, in a picture must tend to uniformity, mechanical treatment, and a divergence from nature, which should be the inspiration of all art. It is forgotten that these rules are based on the works of the closest of all observers of nature, the great masters of the art of painting—those who are masters of both what is called, for convenience, "high" and "low" art. That there is a similarity in the methods of arrangement—which will be shown further on—in the compositions of the great Italian schools and the Dutch is the greatest proof of their truth to nature, and that there is more in them than those who take a superficial view of art, and object to these quasi-laws, are capable of seeing. The happy quotation from Sir Joshua Reynolds should make it evident that they would have no power to "fetter genius," or, indeed, those who have much lower art qualifications than that much abused word implies. In addition to the last paragraph on concealing the art I should like to quote C. R. Leslie on the same point,—

"The axiom that the most perfect art is that in which the art is most concealed, is directed, I apprehend, against an ostentatious display of the means by which the end is accomplished, and does not imply that we are to be cheated into a belief of the artist having effected his purpose by a happy chance, or by such extraordinary gifts as to have rendered study and pains unnecessary. On the contrary, we always appreciate, and therefore enjoy, a picture the more in proportion as we discover ourselves, or are shown by others, the why and the wherefore of its excellences; and much of the pleasure it gives us depends on the intellectual employment it affords."

Another inducement to the study of this subject is that it

greatly tends to the elimination of chance. It may stimulate the student to read the dictum of Ruskin, "Nothing is more strange in art than the way that chance and materials seem to favour you, *when once you have thoroughly conquered them*. Make yourself quite independent of chance, get your result in spite of it, and from that day forward all things will somehow fall as you would have them."

(To be continued.)

## Chemistry for Photographers.

By C. H. BOTHAMLEY, F.I.C., F.C.S.

(Continued from page 14.)

EXPERIMENT 91.—Place some clear transparent "soda crystals" (washing soda) on a large watch-glass, weigh the glass and its contents, and allow them to remain exposed to air for some time. Do the same thing with some transparent crystals of sodium sulphate. In both cases the crystals will become white and opaque, and on again weighing the watch-glasses and their contents it will be found that there has been a considerable loss of weight, owing to the fact that the salts have given off part or all of their combined water. The soda crystals have changed from  $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$  to  $\text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O}$ , and the sodium sulphate from  $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$  to  $\text{Na}_2\text{SO}_4$ .

Salts which behave in this way, giving off their combined water when merely exposed to the atmosphere, and losing their crystalline form, are said to *effloresce* and to be *efflorescent*.

Salts and other compounds which absorb water from the air when exposed to it are said to be *hygroscopic*, and if they absorb so much water that a liquid is formed, they are said to be *deliquescent*.

EXPERIMENT 92.—Place on separate watch-glasses some caustic soda, caustic potash, calcium chloride, zinc chloride, and potassium carbonate. Weigh them, and expose them to the air for some time. All these compounds will deliquesce, *i.e.*, will absorb so much moisture from the air that a liquid will be formed, and if the watch-glasses are then weighed, they will be found to have increased considerably in weight.

A **BASE** is a substance which interacts with an acid and forms a salt, but the term is commonly restricted to oxides or hydroxides that have the power of neutralising acids, and the free metals are not spoken of as bases. The metal in a salt, however, is frequently called the *basic constituent* or *basic radicle* of the salt.

### WATER.

We have already met with evidence as to the qualitative composition of water. We have obtained from it oxygen and hydrogen by the action of the electric current, and we have produced it by the combustion of hydrogen in oxygen or in air. By no known process can anything besides oxygen and hydrogen be obtained from pure water, and from these elements alone we can form water. It follows that water is a compound of oxygen and hydrogen, and Expt. 26 has shown us that the *volume* of the hydrogen is almost exactly double that of the oxygen.

In order to determine quantitatively the composition of water, we may either ascertain the *volumes* of hydrogen and oxygen which will unite to form a given mass of water, or we may ascertain the *weight* of the oxygen and of the hydrogen contained in a given weight of water. In the first case we are dealing with the *volumetric composition*, and in the second with the *gravimetric composition*.

The volumetric composition is determined by bringing together accurately measured volumes of carefully purified

hydrogen and oxygen, causing them to combine, and then measuring the volume of any gas that is left uncombined. It is found as the result of a large number of experiments that two volumes of hydrogen combine with one volume of oxygen, and if the gases are mixed in any other proportion part of one of them will be left in the free state after combination has taken place.

The gravimetric composition is determined by passing pure and dry hydrogen\* over heated copper oxide (Expt. 49) previously weighed with the greatest accuracy. The water that is formed is condensed and collected in tubes containing pumice stone and phosphorous pentoxide. This collecting apparatus is weighed before and after the experiment, and the increase gives the weight of the water that has been formed. The copper that is left in the hot bulb or tube is allowed to cool, and is weighed; the difference between the weight of the original copper oxide and the weight of the reduced copper is the weight of the oxygen in the water that has been formed. The difference between the weight of the water that has been formed, and the weight of the oxygen in it is obviously the weight of the hydrogen that it contains. Numerous experiments lead to the result that in every 100 parts by weight of water there are 88.89 parts of oxygen and 11.11 parts of hydrogen, or in eighteen parts of water there are sixteen parts of oxygen and two parts of hydrogen. The formula of the compound is  $\text{H}_2\text{O}$ .

Pure water is a tasteless, odourless, neutral liquid, which in small quantities seems to be colourless, but when seen in large masses has a distinct bluish tint. Although liquid at the ordinary temperature, it is readily converted into a solid (ice) at a moderately low temperature, and into a gas (steam) at a moderately high one. The relations of water to heat are, in fact, of considerable practical importance.

If we take a measured volume of warm water and surround it by a freezing mixture, the water gradually cools, and, like all other liquids, as it cools it contracts. It goes on contracting until the temperature has fallen to  $4^\circ\text{C}$ . ( $39.2^\circ\text{F}$ .), and then, unlike any other liquid, though the temperature continues to fall, it ceases to contract, and actually begins to expand, and goes on expanding until the temperature has fallen to  $0^\circ\text{C}$ . ( $32^\circ$ ). At this point, under normal conditions, the water freezes, *i.e.*, passes from the liquid to the solid condition. At the moment of solidification there is a sudden and very considerable expansion, ten volumes of water forming very nearly eleven volumes of ice. This great expansion takes place with enormous force, and is the cause of the bursting of water pipes, etc., during frost. The injury does not take place, as is commonly supposed, during a thaw, but the ice that is formed plugs up the rent that has been made, and it is only when a thaw melts the ice that the mischief is discovered.

From the fact that water contracts when it is heated up to  $4^\circ$  from a lower temperature, or when it is cooled down to  $4^\circ$  from a higher temperature, it follows that a given mass or quantity of water occupies a smaller volume at  $4^\circ$  than at any other temperature, and hence this point is termed the *point of maximum density of water*.

If we take a quantity of ice, and heat it in a suitable vessel, the temperature rises to  $0^\circ$ , and then the ice begins to melt. So long as any ice remains unmelted, and the whole mass is thoroughly stirred, the temperature remains constant at  $0^\circ$ , and all the heat that is supplied simply does the work of converting the solid ice into liquid water without raising its temperature. The heat thus used up is said to become *latent*, and is called a *latent heat of fusion of ice*.

\* The hydrogen is purified by passing it successively through solutions of lead, nitrate silver sulphate, and caustic potash; it is dried by passing it through long tubes containing solid caustic potash and then through tubes containing phosphorous pentoxide.

The quantity of heat required to change a kilogramme of ice at  $0^{\circ}$  into a kilogramme of water at  $0^{\circ}$  is 79 thermal units, or, in other words, would raise the temperature of 79 kilogrammes of water by  $1^{\circ}$ .

As soon as all the ice is melted the temperature of the water gradually rises, and the liquid contracts up to  $4^{\circ}$ , and then expands as the temperature rises, giving off an increasing amount of vapour, until at  $100^{\circ}$  the water enters into ebullition, or, in other words, steam escapes in bubbles from all parts of the liquid. If the steam can escape freely, the temperature of the water and of the steam just above it remains constant until all the water boils away, and the effect of supplying more heat is to make the water boil faster without raising the temperature of either it or the steam. The heat supplied does the work of converting the liquid water at  $100^{\circ}$  into gaseous water, or steam, at  $100^{\circ}$ . It becomes latent, and is called the *latent heat of vaporisation* of water. When the steam condenses back to a liquid, the latent heat of vaporisation is given out again, and since it is very large in amount this explains why scalds from steam are always much more severe than scalds from hot water.

The exact temperature at which water boils depends upon the pressure of the surrounding atmosphere, and is higher the higher the pressure, a difference of 27 mm. in the height of the barometer, making a difference of  $1^{\circ}$  C in the boiling point. Since the pressure at the top of a mountain is lower than that in the valley, it follows that a higher temperature is required to make water boil in the valley than at the top of the mountain.

Certain other conditions also affect the temperature at which ebullition takes place. If the water is in a perfectly clean glass vessel with a smooth internal surface, two or three degrees higher is required than if it is in a metal vessel, or a vessel with a rough surface. If the water is quite free from dissolved gas (if, for instance, it has been heated for some time just below the boiling point, so that the gas has been expelled), and in a clean smooth vessel, regular ebullition does not take place, but the steam is generated in sudden and even explosive bursts, which may become dangerous. It seems that the bubbles of steam will form only on the points of a rough surface, or round small bubbles of gas which may be escaping from the liquid. Regular ebullition is secured by placing in the liquid small pieces of platinum wire or foil, or short pieces of capillary glass tube sealed up at one end. If the nature of the liquid and other circumstances permit, small pieces of filter paper serve the same end. The air absorbed by the surface of the platinum or contained in the capillary tubes, or the rough surface of the filter paper, furnish the necessary nuclei on which the bubbles of steam can form.

(To be continued.)

## Photographic Work for the Winter Months.

By T. PERKINS, M.A.

### CHAPTER II.

#### OUT-DOOR WORK—SCIENTIFIC.

In the last chapter I pointed out certain classes of subjects for artistic photography, for which the winter months are as suitable as, and in some cases more suitable than, those periods of the year when the camera is most frequently seen; but, after all, the number of photographers who are capable of producing artistic work is so small that, as it has

often been said before, the majority of workers would do best if they devoted their energies to the other side of photography, namely, the scientific in some one or more of its branches; and for much work of this kind the winter months are admirably adapted. And foremost among the divisions of scientific photography, I should, on account of its unfailing charm and interest, place architectural work. There can be no doubt that there is much of this remaining to be done, much which ought to be done without delay, for every year, in buildings as in other things,

"The old order changes, giving place to new."

And if we would preserve records of things which exist now, but which will soon exist no longer, no time is to be lost. Negatives should be taken from which permanent prints may, when needed, be made, and when properly mounted and described might be carefully packed in damp-resisting cases, to be deposited in the new Pompeii which, let us hope, may not be simply the dream of a brilliant writer, but may take some practical form before this century has closed.

Now, no doubt, one of the drawbacks of winter from a photographer's point of view is the increased exposure rendered necessary by the weaker light, yet for photographing buildings an increase of the exposure to ten or twelve times its summer duration is no great drawback; sometimes it is a positive advantage. On some occasions, when moving figures have been more than usually troublesome, and it was impossible either to induce them to stand still or to use a shutter, I have put in the smallest stop, giving a long exposure, and allowed the figures to do as they liked. This can be done, of course, much more successfully in winter, when the light allows with  $f/64$  an exposure of fifteen or twenty minutes to be given. The same plan, too, may be adopted if branches of trees are blowing about; but of course wind causes far less motion of trees in winter than in summer, as the leafless branches offer far less resistance to the wind than the heavily-laden boughs of summer.

The absence of foliage, too, often enables us in the winter to get a picture of a building which in summer is almost concealed by trees, or if not actually concealed, so heavily shaded by the leafy branches that much of its beauty cannot be well brought out. No one can have devoted himself much to photographing the country churches of England without finding trees growing in and around the churchyards much in the way, and possibly feeling sometimes inclined to repeat, with application to those who planted them, sundry lines from the thirteenth Ode of Horace's second book. The yews and other funereal evergreens are as troublesome at one season as another, but the elms, which seem in some places to delight to gather round the churchyards, as if to gaze upon the spot where so many trunks of their kindred, cut into coffin planks, are reposing, lose their leaves in winter, and open out a view of the church which it would be impossible to get in the summer. I believe it may be taken for granted that sunshine is necessary for the most successful representation of the exteriors of churches, especially if there is much carving on the walls, for the contrasted light and shade brings the carving out more forcibly, but it is, of course, possible to have the light too brilliant, and the fainter light of a sunny winter's day will often be found just what we need. The lesser altitude, too, of the mid-day sun is also a fact that we may take advantage of; in the summer a picture that for other reasons we must take at noon may be lit too vertically, so that far too heavy shades are caused below some projecting cornice or string-course. The south porch of a church, for instance, will

generally be found to be better lighted in the winter than the summer, for the rays of the sun penetrate further into the recesses, and, reflected from the floor, light up the ceiling of the porch better. The same characteristic of the winter sun is of use in interior photography; for many purposes perhaps we should be inclined to choose a summer day when the light is good but the sun is not actually shining, but cases sometimes arise in which we may be glad to have spots of actual sunlight, provided it is not too strong, to fall on arch or pillar and give greater relief to the picture: the light from a low sun will often be more suitable than the light from a high one. Once again, the presence of snow on the ground outside may be put to good use in photographing a church with a dark wooden roof. How often it happens under ordinary circumstances that it is impossible to get sufficient detail in the roof without utterly over-exposing the walls and pillars. Now the diffused light reflected from a fall of snow outside sufficiently thick to cover the ground penetrates into the dark corners of the roof, and reveals to the eye details probably never so well seen at any other time, and enables the lens to impress them on the plate. In fact, the sheet of snow outside acts much as the sheet of cardboard or linen which we are recommended to use when taking portraits in an ordinary room. This is a fact well worth bearing in mind, and if any have failed to obtain satisfactory detail in the dark roof of some church, although the other parts of their picture have been successful, it would be well for them to take advantage of a fall of snow this winter for another exposure.

There is another style of work which I am sure would be of great use and interest which can only be done in the winter; that is, the production of a series of prints showing the manner of growth and branching of trees. What the bony framework of the skeleton is to the human figure, that the trunk and branches are to trees; what the study of anatomy is to the figure painter, that the study of the forms of the wooden framework of trees is to the landscape painter. It is, indeed, sometimes said that it is not the business of the painter to so paint the landscapes that one who examines them can say, "That is an elm, that is an oak," but this is true only so far as it asserts that the painter must not neglect the effects of mist or distance or lighting in his endeavours to emphasize the fact that this or that tree in the middle distance is of a certain kind. No doubt, as we look at a woodland landscape in nature, the first thought that arises in our mind is not, "These trees are beeches; these, firs." But we enjoy the harmony of colour, the balance of the composition. But if an artist undertakes to represent the scene, unless he is able to paint it entirely on the spot, a thing rendered difficult by light and effect, he is likely to fall into mistakes unless he has some knowledge of the manner in which trees grow. He will possibly combine the colouring of one kind of tree with the form of another, or even may fall into more serious blunders, and, like many of the old masters, draw such trees as not only never existed but by no possibility could ever have existed. It may be said the artist may go out into the woods and study for himself without the intervention or aid of the photographer. True, but yet the photograph will be of use; it represents on a flat surface an exact image of the tree as seen from the point of view where the camera was placed, all the perspective, all the foreshortening being accurately and easily done. The photograph can then be studied at leisure, and in comfort, by the cosy fireside on a winter evening—a much more pleasant process for the artist than sitting down on a winter day and studying the original in the open-air.

And how much may be learnt by studying a good

photograph—first and foremost the angles which the main branches make at different heights from the ground; the tendency which one tree shows to split up at a certain height into a number of large limbs, so that the trunk, as it were, ceases to exist, while in another the trunk runs up to a great height, shooting out branches right or left; then the curious fact will be noticed that as long as no branches are shot out the cross section of the trunk remains about the same, but that as soon as a branch is shot out the area of the cross section of the trunk is diminished, so that the sum of the areas of the cross sections of the trunk and branch just above the fork is about equal to the area of the cross section of the trunk alone below; and how a similar law holds good throughout the whole tree, a law which we see artists often, through ignorance of it, disregarding. Then we shall notice the characteristic way in which the bark of different kinds of trees breaks up. What, for instance, can be more unlike than the bark of the oak, the beech, the sycamore, and the birch? Then, again, a photograph will show how the growth of a tree is modified by its surroundings—the rock that shelters it from certain winds, the presence of other trees around it which tend to check a lateral outgrowth, and to draw the trunks upwards in their search for air and light. In fact, the number of characteristics of the growth which a carefully selected set of photographs will reveal is well-nigh infinite. Here is work sufficient to occupy the photographer, who lives in the midst of woodland scenery, all the still, bright days of many a winter. And such work will be really useful both to himself and others; he may learn much from his own prints, and if he can reproduce and lend them, others may learn much from them too. I can conceive no better form of early study for one taking up the art of drawing woodland subjects from nature than copying in pencil the accurate representation which photography can give of the anatomy of tree forms. Of course, it will be impossible to copy all the finer branches and twigs, but the main branch work may be and should be carefully copied. Photographs of the same trees from the same points of view taken when spring has begun to clothe the branches with leaves, and when full-leaved summer in its glory has come, will be found useful additions to the series.

For work such as has just been described, the winter months alone are suitable, but there are other kinds of work for which, if winter is not absolutely necessary, yet it is suitable, and that is for securing geological studies. There probably is no subject on which the general public have such erroneous ideas as rock forms. Stones and rocks are irregular in shape; that is the first observation made, and often the last one too; and from this one observation the general conclusion is drawn that rocks may be of any shape. Look at the paintings of the early Italian masters; whenever they want to represent in their pictures a background of rock or mountain, what monstrosities do we behold—"impossible" rocks, as Ruskin calls them in his "Modern Painters," unless my memory plays me false. The forms of rocks depend on their structure; the soft red sandstone will not form overhanging sea cliffs like the harder crystalline rocks, the granite appears in rounded bosses and blocks, very different from the sharp-edged masses of limestone. The pendant stalactite is found alone in water-worn caves formed of rock whose main constituent is carbonate of lime. The bases of hard cliffs against which the stormy sea hurls, and over which it drags the rounded pebbles, have their angles ground down and polished. The masses of rock in the gorge of a mountain stream are likewise rounded, and sometimes in the valleys which once were filled by glaciers, the bosses of rock are smoothed and planed and scored by the old ice plough which thousands of years ago

moved slowly over the valley bed. Into what errors artists have fallen from ignorance of these laws and causes. How unlike anything in nature are the arched rocks which painters at one time so much delighted in. How incongruous and out of place are many of the rock forms we meet with in conventional landscape. How much the painter may learn from photographs in this respect.

The influence of photography upon artists is, perhaps, greater than many suppose. Compare the work of the modern landscape painter with that of the painter of the classic landscape of former times, and the greater truth and realism and naturalism of the modern artist is at once apparent. This no doubt is partly due to greater love of nature and more reverent study of her beauties, but I think that photography has had something to do with it. Even the much despised topographical photograph has educated the eye of the public, and people are beginning to expect greater truth in the matter of form from the painter and draughtsman, and hence those who can lay no claim to the title of artist themselves, may do good work by educating the eye of the public to appreciate accuracy, and those who have the power of producing technically good negatives and prints, and who live by the seaside, or by the bank of mountain streams, or even by the side of more slowly flowing rivers, may advance the cause of art. The windings of a river, the form of the banks on either side are not mere matters of chance, but depend on the nature of the soil, the speed and volume of the stream; and these characteristics it is peculiarly the function of photography to seize upon and represent with accuracy. Much of such work may, of course, be done in the summer, but many there are who during the summer months will prefer to devote themselves to other branches of the art or science of photography, and these will find not a few days in the winter which allow of some of the useful work above described being done, not only with profit to themselves and others, but with also no small pleasure to themselves. There are, however, not a few days in winter when weather renders all out-door work impossible, but for these dull wintry days photography will supply employment of many kinds, some of which will be described in the next article.

(To be continued.)

## Photo-Micrography.—II.

BY ANDREW PRINGLE.

### MICROSCOPES, AND PHOTO-MICROGRAPHIC APPARATUS.

THE essentials for a "stand" to be used for our work are, mainly, steadiness and accurate fitting of the "adjustments." It is practically essential, further, that the stand be supported on its "feet" in such a way that the tube can be turned to the horizontal position, for the horizontal position of the optical axis of the entire micrographic system is infinitely preferable to the vertical position. There are, perhaps, a few cases where the object, being liquid or in a liquid, must be kept horizontal, but with all my experience I have never yet had to deal with an object that required to be kept horizontal. The apparatus I use, however, is quite fitted for the vertical position, without alteration, if such necessity arises.

There are many microscopes on the market very well suited for ordinary photo-micrography, and some of the stands sold as staple articles by the best opticians may be accepted as equal to the very finest work. For instance, the best model of Messrs. Powell and Lealand, No. 1 or No. 2, is as good as a stand can be, not specially made for

our purpose. I have used with great satisfaction the "Wales" pattern stand of Messrs. Swift, and Mr. Charles Baker's "Nelson" model. Dr. Van Heurck, of Antwerp, who goes into the most critical work with enormous magnifications, swears by a stand of Messrs. Watson, while others who do good work prefer a stand of Mr. Beck's make to all others. The particular model is not so much the point as steadiness and good fitting, especially of the fine adjustment. Moreover, all these opticians sell entire photo-micrographic apparatus, each one fitting a camera to his own favourite stand, and having examined nearly all the apparatus put forward for this purpose, I can say that good work may be done with any of them, the very best work with some.

The essence of a photo-micrographic apparatus is a camera with a plate to receive the image projected by the optical apparatus of the microscope. Until lately the habit has been to adapt a camera to some existing form of microscope, but during this year a "new departure," as a kindly critic at the Royal Microscopical Society termed it, has been made by Messrs. Swift and myself, in creating a microscope for the purpose of photo-micrography. This instrument has for its chief features an unusually long and strong body bearing the tube, and a strong rigid support for the eye-piece end of the tube. The latter I believe to be the prominent and most valuable feature in the design; at all events, by its means we have secured by far the steadiest instrument I have ever seen. I would give a figure of it, but the block would be too large for this page. The price of this instrument is large, but not exorbitant by any means, when we take into account the universality of its motions and the extreme accuracy of its fittings. Mr. Baker has, however, constructed for me an instrument more suited to my means, and embodying the leading ideas of the Swift instrument. I figure this instrument (fig. 1), in the hope that on examining the cut the reader will understand the lines upon which it is made.

It will be observed that here we have the long body and the support for the eye-piece end of the tube.

A perfect instrument, such as the best model of all good opticians, comprises: Coarse and fine tube adjustments, mechanical and rotating stage, coarse and fine adjustment to substage, also rotating (sometimes) and centering (always) motions to substage. I consider it necessary to have a good length of draw-tube, and I like this to be worked with a rack; the use of this will be found when we come to use certain "apochromatic" objectives. The tube of the instrument should be of fairly wide bore, but need not be so wide as to cause inconvenience in adapting eye-pieces to it.

The camera may be of the simplest kind, either wooden or bellows body; but it must have a considerable stretch from front to back, 40 ins. to 60 ins.; 40 ins. will be enough if the ocular is to be used, 60 ins. will be required if otherwise. No "swing-backs" nor rising fronts are needed. The dark-slide must go into position very easily, preferably by a spring catch. A ground-glass is needed, and a piece of plate glass with a few diamond lines on the front face. A focussing glass is set to focus on these lines; the focuser may be a Ramsden or a Zeiss Aplanat, made for the purpose. Some means must be provided for making a light-tight connection between the front of the camera and the ocular end of the microscope. On the front of the camera a metal cylinder may project (like a lens tube without the glasses), a hood of velvet may be passed over this and over the tube; or the cylinder may go inside another slightly larger cylinder on the end of the tube. Inside the camera there should be a flap shutter operated from the outside; by this the exposure is started and stopped.

The base of the whole system is a very heavy plank of

teak, several inches thick, accurately planed and smoothed. Towards one end of this is another solid table turning on a pivot near the centre of gravity. The pivot consists of a strong clamping-screw. On this table the microscope and the illuminating arrangements are firmly clamped down, and the clamping-screw clamps the whole to the base. The camera raised to the proper height is also by itself clamped to the common base, but I like to have a small amount of traversing motion for the rear end of the camera. This is obtained by a clamping-screw and a slot. The front of the camera bearing the projecting hood has a few inches of motion backward and forward.

In order to manipulate the fine adjustment when we are beyond arm's reach of the fine adjustment screw, several means are used. The device known as Hooke's joint is affected by some, but on the whole I prefer a pulley passing round the milled head and stretched over two other pulleys, one of which is operated by a rigid rod fitting the axle of the pulley by a square fitting. This is difficult to describe,

one line; plate parallel with object and perpendicular to optical axis; centre of field projected on centre of plate.

To find and fix true position for the whole system: Place the camera in the central position, which should be marked or fixed by a stop. Place an objective (say 1 in.) in the tube, a condenser with a small aperture in the substage, the light as nearly in position as possible by guess. Focus the pinhole aperture in the condenser, centre the same by the centering screws. Get an image of the light on the field by moving the light about; focus, and centre (by moving it) this image of the light. (If an oil lamp is used, turn the flame edge to the condenser. There will then be a streak of light down the centre of the field.) Once more focus the pinhole aperture, push the turntable to its central position, project the image upon the camera ground-glass, the centre of which must be marked; move the microscope till the image of the aperture falls exactly on the centre of the ground-glass. Now project the image of the flame (by focussing it) on the ground-glass, and by moving the

FIG. 1.—MY PRESENT INSTRUMENT.

but will be understood at once from fig. 1, or, better, from seeing an example.

The entire apparatus may be mounted at the proper height for the standing or for the sitting position of the worker. I always sit, and I consider sitting a steadier position than standing, and for critical adjustment of focus and "corrections" steadiness is necessary. Moreover, a low table or trestle is likely to be steadier than a high one.

In practice, in order to search for, examine, centre, and focus the object, the turning-table is turned out from the centre of the system; for this the clamping-screw is loosened, the square fitting of the focussing-rod disconnected, the camera-front pushed back if necessary; the turntable is then swung out so that the ocular points towards the operator. Light, condenser, object, objective, and ocular are then all in position for centering, focussing, correcting, etc. When these operations are performed, the turn-table is pushed back to its original alignment, where it is kept by a stop.

During exposure it is absolutely necessary that the following be the state of affairs: Light, optical axis of microscope and condenser, and centre of ground-glass all in

lamp, if necessary, cause its image to fall centrally on the ground-glass. Now clamp the microscope and light in position. All is now ready for work.

All may doubtless be done without any apparatus, except a microscope, a lamp, and a camera; but if we do not fix our entire arrangement in some way, this centering has to be gone through each time that we begin to work. I have seen very good work indeed, and pretty high-power work too, done with loose pieces of apparatus, but to succeed in this way requires more than ordinary patience and skill.

NOTE.—In the cut (fig. 1) the instrument is represented a left-handed. This is due to a misunderstanding which there is not time to correct.

**New Mezzotint.**—The capital picture by Mr. Jas. Sant, R.A., entitled, "A Thorn Amidst the Roses," has been reproduced in mezzotint by Mr. Scott Bridgwater. It will be remembered that the original is in the possession of the Manchester Corporation, a fact of which they may well be proud. Mr. Sant's genius is shown strikingly in the mezzotint, which does great credit to Mr. Bridgwater. The principal Painter in Ordinary to the Queen may congratulate himself upon so accurate an interpreter of his subject. Proofs and Indian prints will soon be procurable from Messrs. Dowdeswell's.

## Notes for Novices.

### RATIO APERTURE OF STOPS OR DIAPHRAGMS.

IN our last note we briefly considered the determination of the ratio value of the diaphragm apertures, and we now proceed to consider their influence on the exposure. This is by no means a difficult subject to calculate, but one often bungled over by the novice. Briefly stated, the rule is that the exposure with any two diaphragms varies as the square of the number expressing their ratio aperture. Let us take an example or two, to make this still more easy of comprehension. We have been using a lens of  $10\frac{1}{2}$  in. focus, with  $f/16$ , and find that it is desirable to use a smaller aperture diaphragm, viz.  $f/22$ , so as to obtain increase of sharpness; and to find the exposure with this aperture we square the two numbers 16 and 22.

$$16 \times 16 = 256$$

$$22 \times 22 = 484.$$

Therefore the exposures are as 256 : 484, or as 64 : 121, or practically as 1 : 2. It is therefore extremely easy to calculate the relative exposures with all the diaphragms of our lenses in the same way, and we construct the following little table for convenience:—

Ratio Aperture.	Relative Exposure.
$f/6$ .. .. .	36 = $\frac{1}{2}$
$f/8$ .. .. .	64 = 1
$f/10$ .. .. .	100 = $1\frac{1}{2}$
$f/11$ .. .. .	121 = 2
$f/16$ .. .. .	256 = 4
$f/20$ .. .. .	400 = $6\frac{1}{4}$
$f/22$ .. .. .	484 = 8
$f/32$ .. .. .	1,024 = 16
$f/40$ .. .. .	1,600 = 25
$f/45$ .. .. .	2,025 = 31
$f/50$ .. .. .	2,500 = 39
$f/64$ .. .. .	4,096 = 64

We thus get a series of big numbers which might puzzle some, so we reduce all the factors, and make  $f/8$  our unit. That is, we reckon that if the exposure with  $f/8$  be 1 sec., the other diaphragms will require an increase of exposure which is expressed in our third column above. The same rule applies whether we use a lens of 5 in. focal length or one of 22 in. focal length. We take no note of the increase of focal length, and perhaps increase of the size of plate, and merely consider the increase and decrease of the ratio aperture of the diaphragm.

### THE RATIO APERTURE NOT CONSTANT.

It must not be considered for one moment that the ratio aperture is an invariable constant quantity which cannot alter—practically it alters with every alteration of the distance of the object focussed, but when this object is near, as in reducing, enlarging, portraiture, or copying, we must again calculate out our ratio aperture from the new focal length. This is an important point too frequently overlooked—as a glance down our Query columns will at once show—as we find a query such as the following: What will be the exposure required with a half-plate R.R. working at  $f/8$  when reducing from a half-plate to lantern size? We have taken this as a sample. We do not for one moment say this actual query appeared, but many have like it. Now just let us see what actually takes place. We suppose that we are using, as the querist says, “a half-plate R.R.” Now the diameter of such a lens—we mean the actual glass of the front lens—is  $1\frac{7}{8}$  ins. (this is taken from actual measurement), the focal length is  $8\frac{1}{4}$  ins., the aperture of the largest diaphragm, that is, the fixed diaphragm in the lens tube, is  $f/8$  or  $8\frac{1}{4} \div 8 = 1\frac{1}{8}$  ins. But this is only  $f/8$  for the equivalent focus or focal length, therefore we have to recalculate the ratio aperture from the increased focus of the lens consequent on the racking out of the lens. Let us see what the racking out of the lens is. The amount of reduction of a half-plate to lantern size is practically half, therefore the increase of focal length of the lens is from  $8\frac{1}{4}$  to  $12\frac{3}{4}$ , therefore to find the ratio aperture of our fixed stop we must divide  $12\frac{3}{4}$  by  $1\frac{1}{8}$  in., and we find that  $f/8$  is now  $f/12$ . By measuring the diameter of the other diaphragms, and dividing the amount thus found into the new focal length, the ratio values will, of course, bear the same relative value one to another as at first, but the ratio aperture of each is diminished. This rule applies to every instance where an object is photographed which

is not situated at infinity, but this increase of focal length may be disregarded practically when the object is distant more than fifty times the focus of the lens.

We often see the statement of a portrait taken with a single or double lens working at  $f/8$  when actually, from the size of the portrait, it is obvious that the sitter and lens were comparatively near, and consequently the lens was working at a very much smaller aperture. This increase of focal length and consequent decrease of ratio aperture of diaphragm must be taken into account when working from published tables of exposure for portraits, enlargements, and reduction.

## Notes from the Liverpool Centre.

(By our District Editor.)

I HAVE still another death to record, that of Mr. MacDonald Bell, one of the best, as he was one of the most well-known, members of the Liverpool Society. He will also be widely known, at least by repute, to readers of the AMATEUR PHOTOGRAPHER. Mr. Bell's forte was lantern-slide making—a department in photography in which he was excelled by few. He died on Sunday night last after a short illness.

As the time draws near, the volume of correspondence and the enormous amount of interest in regard to the Liverpool (1891) Exhibition increases. The applications for space in the show, I understand, both for pictures and apparatus, point to an exceedingly large and successful function. It is hoped that, to keep pace with this and progress in other departments, headway will be made in the matter of cheap railway fares to the Exhibition, particularly, of course, for gentlemen of the photographic cult.

At the time of writing—Wednesday night—appearances indicate that there will be a big gathering at the Birkenhead Society's rooms to-morrow, when Mrs. George Thompson and Miss Thompson give their soirée and evening of general entertainment. Several gentlemen of acknowledged standing are to give short lantern exhibitions, as I think I have already intimated.

There was a profitable and instructive meeting at the Walton Association's quarters last Wednesday night, when members contributed to the discussion on the methods of intensification and reduction.

Of the new perfect dissolver by Archer, I have a few words to add. The ingenious contrivance is not christened yet, so I cannot, therefore, give its name. However, it is a dissolver for single lanterns, and has nearly the same effect as is the case in a double lantern. It is practically a frame for two slides at the back, having in front a piece of ground-glass or celluloid. The picture on the screen is dissolved by its agency, unseen, the whole being simply worked by a quadrant lever.

Another novelty of the same go-ahead firm is the “Ideal” single lantern, focussed with a camera-like bellows, and ranging up to 100 feet. The whole of the front can be removed, thus allowing for the use of scientific apparatus, and the bellows front is worked by a rack running the whole length of the lantern, in addition, of course, to the short rack on the object lenses. The instrument is elegantly and exceptionally substantially made.

## Societies' Meetings.

**Barnstaple and North Devon.**—The ordinary monthly meeting was held on the 7th inst., the subject before the meeting being “Notes on Exposure and Development,” by the Vice-President (Mr. W. Ridd). The lecturer's remarks were ably illustrated by diagrams on the black-board, and at the conclusion several plates which had received widely different exposures were developed. These, by the skilful manipulation of the demonstrator, were made to produce negatives, which, for printing value, were hard to distinguish one from the other, showing the great latitude of exposure possible on a dry-plate, if only intelligent development be employed. It was decided that the Society should undertake the photographic survey of Barnstaple and district, the Council to draw up a scheme for same, and lay it before the next general meeting. It was also thought desirable that a beginners' class should be formed in connection with the Society, and the matter was referred to the Council for consideration.

**Blackburn and District.**—Thursday, the 8th inst., was a lantern evening. Major Baron presided. It was resolved to meet

on Thursdays instead of Tuesdays. One new member joined. Major Baron will give his paper on "Stereoscopic Photography," on Thursday, the 22nd of this month.

**Brixton and Clapham.**—At the meeting on 8th inst. Mr. H. M. Smith gave an interesting address on "Film Photography."

**Cambridge.**—A large number of people assembled in the rooms of the above club on the 5th inst., when Mr. H. Smith gave a demonstration on the Kodak, films, etc.

**Croydon.**—A large number of members assembled on the 5th inst. to witness the first public performance of the new oxy-hydrogen lantern which has been constructed by the energetic Hon. Secretary, Mr. G. R. White. The instrument gave the greatest satisfaction, the lighting being even and the definition very distinct. Over 200 of the slides of members were passed through the lantern. The forthcoming meeting will be on Monday, 19th inst., when Mr. A. R. Dresser will discourse on "Hand-Camera Work," illustrated by lantern slides and enlargements.

**Croydon Microscopical.**—At the meeting on the 9th inst., Mr. E. Lovett (President) in the chair, Mr. A. W. Clayden, M.A., F.C.S., etc., gave a very interesting paper on "The Method Adopted for Taking Photographs of Clouds for Meteorological Purposes." A specially constructed camera, exhibited by Mr. Clayden, carried, in front of the lens, a square of dark-coloured glass, and the photographs were taken from the reflecting surface, set at an angle of 33 degs. A great many slides taken by this method were exhibited on the screen, consisting of fine specimens of cirrus, cumuli, and other clouds, and were noticeable for their brilliancy and depth.

**Darlington.**—The judging of the photographs sent in for competition took place on the 12th inst. with the following results:—Class I. (open to members of the society only): (1) Mr. T. Howlett; (2) Rev. C. G. Davis. AMATEUR PHOTOGRAPHER Bronze Medal for best single picture in the class was won by Mr. T. Howlett with a picture entitled "The Loose Shoe." Class II. (open to all amateurs): (1) Mr. T. Howlett. AMATEUR PHOTOGRAPHER Silver Medal for best single picture in this class was won by Mr. Edmund Barker, of West Hartlepool ("Aberdovey, North Wales"). Mr. Howlett exhibited the best picture, but as it had been shown before, it was not eligible to compete for the medal. Lantern Slide Class: (1) Rev. C. G. Davis (winner of Silver Medal in AMATEUR PHOTOGRAPHER open competition held lately). The medal granted by *Photography* for best single slide was won by Mr. T. Howlett. The judges were Mr. Edgar G. Lee (Hon. Sec., Newcastle-on-Tyne Photographic Society) and Mr. J. S. Sinclair, of this town.

**East Southsea.**—The members met on the 6th inst., when the following officers and committee were appointed for the ensuing year. Mr. J. Cleminson, President; and Messrs. J. Boyle and Israel Harding, V.C., Vice-Presidents; Mr. C. R. Wright, Treasurer; and Mr. E. J. Fielder, Hon. Secretary. The financial account of the society for the short time of its existence showed a balance on the right side.

**Enfield.**—The ordinary meeting of the Club was held on the 7th inst., the President (Mr. D. G. Pinkney) in the chair. The President read a paper on "Eikonogen," and afterwards gave a practical demonstration with this developer as compared with hydroquinone. A number of slides by members were then exhibited, and a flash-light picture of those present was taken by another member, Mr. R. B. Lodge.

**Hackney.**—The ordinary meeting was held on the 8th inst., the President (Dr. Gerard Smith) in the chair. Mr. Dean showed some prints on Alpha paper, with tones ranging from red to blue. Mr. A. Mackie gave a demonstration of the "Colloio-Bromide Process." Prefacing his demonstration with a short history of the process and its discovery, he made the working of it clear to the non-workers of this charming process. After coating a plate, he proceeded to expose it for about one second by magnesium ribbon, and develop it by a modified alkaline developer, and fix by ordinary fixing bath. He further illustrated the process by explaining the composition of the emulsion, method of preparing it, etc. Lantern slides made by this process were shown on the screen, which were the work of Mr. Mackie and Mr. Hunt.

**Ikeston.**—A photographic society for the borough and district of Ikeston was formed on Thursday evening, the 8th inst., when Dr. Carroll, the medical officer of health for the borough, was elected President; Mr. Geo. Woolliscroft (engineer), Treasurer; and Mr. Wm. Shakspeare (journalist), Honorary Secretary. Rules were adopted, and a Committee formed, and it was arranged that on the following Thursday Mr. G. Woolliscroft should give an address on "Apparatus."

**Ireland.**—An ordinary meeting was held on the 9th inst., Prof. J. A. Scott, M.B., Vice-President, in the chair. The Boston Camera Club set of lantern slides, entitled "In and Around Columbus," were exhibited, and were highly appreciated.

**Lewisham.**—The social meeting and loan exhibition of this Club was held on the 9th inst. The President (the Rev. J. Morley Wright) presided, assisted by the Vice-President (Mr. Alfred H. Miles). The exhibitors included the members of the Club and some of the lead-

ing firms. Messrs. Marion and Co. exhibited Slingsby's flash-light apparatus, six taking groups and one picture of the entire audience (about 250). The programme included a slide exhibition, at which eighty-four slides by members, and the same number from the Editor of the AMATEUR PHOTOGRAPHER, were passed through the lantern, which is a splendid instrument, built on the latest scientific principles by one of the members of the Club, Mr. R. W. James. A good programme of music and recitations was provided, as also a liberal supply of refreshments.

**Lewes.**—An ordinary meeting was held on the 6th inst., the President in the chair. Mr. A. E. Venn was elected a member. The evening was devoted to an exhibition of slides, over 200 being passed through the lantern. An exhibition of members' work, with lantern entertainment and concert, will be held on the 28th inst.

**Morley and District.**—January 7th was a lantern evening, when members and friends had the pleasure of seeing the "White Mountain" slides, which were highly appreciated by all present. In addition to the slides there were on view a set of AMATEUR PHOTOGRAPHER Competition pictures, "Inland Scenery," which were greatly admired.

**North Middlesex.**—At the annual general meeting, Mr. Humphries, F.S.A., in the chair, the following officers were elected for the ensuing year: President, J. Humphries, F.S.A.; Vice-Presidents, W. T. Goodhew, H. Walker; Curator, F. Piper; Council, C. Beadle, H. Beckett, F. Cherry, F. W. Cox, C. Gill, J. C. Lathbridge, W. A. Lavanche, C. R. Martin, G. C. S. Mummery, F. L. Pithes, G. Saville, H. Smith; Treasurer, J. W. Marchant; Hon. Secretary, J. McIntosh (14, Lowman Road, Holloway, N.)

**Notts.**—The first meeting of the year was held at the new rooms in Market Street, on the 5th inst. The business of the evening consisted of a motion by Mr. R. S. Armitage, seconded by Mr. J. Anderson, to admit lady amateurs to the Society, and another proposition that a cordial invitation be given to the Camera Club to join the Association; these were both carried unanimously. In committee, on the motion of Mr. Burrows, it was decided to set apart a whole week for the production of lantern slides of local views for exchange with kindred societies throughout the principal capitals of the world. The official meeting having closed, Mr. S. Wells, the President, again took the chair at the "smoking concert" with which the members inaugurated the new year.

**Sheffield.**—The ordinary monthly meeting was held on the 8th inst., Mr. B. J. Taylor in the chair, when it was announced that the winners of the President's prizes were as follows: First, Mr. E. Beck, with a picture entitled "With the Morning Tide"; second, Mr. Thos. Hibbert, "Cloud Effects." It was arranged that an exhibition of prize lantern slides should take place at the next monthly meeting. A resolution was passed instructing the Secretary to write to Mr. John A. Hodges, London, to offer the support of the Society to endeavour to get the same concessions from the railway companies which are now enjoyed by the fishing clubs all over the country, after which Messrs. Hibbert and Furniss gave a splendid two-man lantern exhibition of their own work, including some grand snow scenes (taken during a recent heavy storm) in Endcliffe Wood, Western Park, etc.

**Southsea.**—The first ordinary meeting of the year was held on the 7th inst., Dr. C. H. Newby in the chair. This was a lantern evening, and Messrs. W. and A. West, hon. members of the Society, exhibited about 100 slides, chiefly of yachts racing, men of war, sailors drilling, etc. The views on the Clyde were particularly noticeable for the fine (natural) cloud effects.

**Staff. Potteries.**—A lantern entertainment was given in the National Schools, Norton-le-Moors, by the Society, on the 8th inst. A number of local views and portraits were shown, together with sets describing "A Trip to Paris" and "Irish Life and Humour." During the evening music enlivened the proceedings. The room was crowded, and the proceeds have been given to the building fund of the above schools.

**West Kent.**—An ordinary meeting was held at Sidcup on the 7th inst., the President (Mr. Andrew Pringle) in the chair. Mr. Pringle presented his silver medal to Mr. E. J. Crowe for a very fine set of twelve lantern-slides; and the society's silver medal for best paper read before the society to Mr. J. Reeves, won by him after a very keen competition. The remainder of the evening was spent in passing through a number of members' lantern-slides. Next meeting will be held at Bexley, January 21st.

**Yorkshire.**—The usual monthly meeting was held on the 9th inst., the President, Dr. Tempest Anderson, in the chair. The Hon. Secretary, Mr. H. R. Moiser, read a paper on the subject of "Platino-type Printing," rapidly sketching the early history of the process so long ago as the year 1832, when Sir John Herschel experimented in this direction. The process, as finally elaborated, is due to Willis, who in the year 1880 perfected his method of hot-bath development. The minute details of the method were fully explained and especial attention was directed to points of manipulation on which difficulties were likely to supervene.

## To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance, the *number and full title of the query* referred to.

## QUERIES.

4444. **Enlargement Retouching.**—Will some reader kindly give me directions and let me know the materials required for touching up bromide enlargements?—**ENLARGER.**
4445. **Enlarged Negatives.**—Will someone kindly inform me what plates and developer to use for making enlarged negatives? Will ordinary plates do, and what is about the exposure? I have an oil enlarging lantern.—**ENLARGER.**
4446. **Matt-Surface Paper.**—Will any practical worker who has used Watson's new matt-surface paper kindly inform me what are the necessities for turning out a good print? I find it almost too sensitive, and with my best negatives a great portion is a mere mass of brown colouring by the time the denser parts are sufficiently printed. Also in the toning it loses so much colour that I am at a loss to know how to use it.—**CLIFFORD BIARRITZ.**
4447. **Bromide Paper and Hydroquinone.**—I see that "Quinol," in answer to Query 4424, says: "I use the same formula as recommended for the Ilford bromide paper," etc. Would "Quinol" oblige me by giving the formula?—**MUWA.**
4448. **Toning Obernetter Paper.**—In toning this paper with a bath made up of 1 oz. hypo, 1 gr. chloride of gold, and 10 oz. water, sometimes I find it will not act properly. After long immersion the prints refuse to tone, remaining a dull brick red and facing very extensively. Can any one explain the reason of this, or suggest a better toning bath which would produce warm sepia shades without such loss of density?—**CORNWALL.**
4449. **Hand-Camera.**—I shall be glad if any one can tell me what hand-camera would be the most suitable for the following purposes: (1) For taking objects in motion (e.g., railway trains, etc.); (2) for taking portraits; (3) with a lens and adjustment, ensuring a good and reliable focus; (4) with stops to the lens, if possible; (5) the hand-camera must be inexpensive.—**THE REDAN.**
4450. **Developing Bromide Prints.**—Should I use fresh developer for each bromide paper, or can it be used more than once?—**PHIM.**
4451. **To Mount Eastman Transparent Films for Enlargements.**—Would some one kindly tell me how to mount Eastman transparent film as used in the Kodaks, for enlarging from?—**J. S. C.**
4452. **Bromide Paper.**—Will any one kindly inform me on which make of bromide paper the finest results can be obtained—Eastman's, Morgan and Kidd's, Fry's, or Ilford's? I have only used Ilford slow, which, I fancy, gives rather harsh results. Am I right?—**NEMO.**
4453. **Enlarging.**—I have purchased one of Lancaster's enlarging lanterns, 8 in. condenser, which I purpose using in my dark-room. Will some reader kindly give me a few practical instructions for using the same? What kind of paper is best, and what developer? Also say if there are any books published on enlarging. I may say when the lamp is lighted there is a little light escapes from the chimney and under the lamp. Would this be injurious to the paper if the rays do not fall on it? Any information will be gladly received by—**WILL.**
4454. **Exposure.**—Will some kind reader give me correct exposure by his meter, as, having exposed by my meter, I have got under-exposures? Actino-

meter number 60, plates 11, subject 1, *f*/32. Would Mr. Watkin kindly oblige?—**J. K. G.**

4455. **Lantern Slides.**—I have some lantern slides (34) which appear of a whitish colour by reflected light, but transparent by transmitted light. Would some one be so good as to inform me how these can be made? Is it a bleaching process? Would you please explain?—**H. E.**

4456. **Shutter.**—Where can I obtain a shutter for hand-camera that requires no setting?—**INKY-FINGER.**

4457. **Oxy-Benzine Light.**—Will any one who has used the oxy-benzine limelight kindly give me any information about it? Can a better light be obtained than with hydrogen? Is it safe to use? Is much more oxygen required?—**T. C. W.**

4458. **Combination Rectigraph.**—Will some one who is using Lancaster's combination Rectigraph patent half-plate lens, No. 376 C, please to state if it is a reliable lens, and what kind of results he gets from it at each of the three angles? I should like to see prints, if possible, of each angle, as I was thinking of getting one, and have not a catalogue of any other make to choose from.—**AMATEUR.**

4459. **Hand-Camera, Loan of.**—Being desirous of making a hand-camera carrying twelve plates in sheaths I should be greatly obliged if any gentleman would be kind enough to lend me working sketches of one, and of which every care would be taken.—**ARTHUR BEARD.**

## ANSWERS.

4430. **Enlarged Copy.**—Copy it full size first, and then enlarge the resulting negative. This is the most satisfactory method.—**MEMNON.**

4431. **Argentotype and Sepiatype Papers.**—Argentotype is merely a fanciful name given to Fry's make of bromide paper, and equally good results can be had on this as on any other make. Sepiatype also gives good results of its kind.—**MEMNON.**

4432. **Mottled Marks on Negatives.**—The marks may arise from many causes. (1) Not rocking the plate during development. (2) Putting into an alum bath immediately after development. These are the most likely causes. The others would not be under your control.—**OSIRIS.**

4433. **Bromide Prints.**—Bleach the prints in a solution of cupric chloride, as suggested in the "Dictionary of Photography." Wash well, and redevelop with hydroquinone.—**MEMPHIS.**

4434. **Copying.**—It is impossible to give full directions in these columns. For oil paintings you must use colour-sensitive plates, and illumine the object by yellow light, or else use a yellow screen. Use the largest stop that will give you good definition. Utterly impossible to give any idea of exposure, as this varies with the light, plate, colour of object, stop, and distance of object. If you will send addressed envelope to the Editor, I shall be pleased to give you further help.—**MEMNON.**

4434. **Copying.**—You should place in a good diffused light, and see that there are no reflections from the surface of the object. If the picture is painted with strong contrasts, expose in clear daylight from half to two seconds, but by gallight the exposure varies from two and a-half to five minutes according to illuminating power. You will find it much easier to focus if you turn the picture upside down.—**JOHN H. MONTAGU.**

4435. **Tripod.**—Mr. William Whiteley sells a pine sliding stand, very light, quickly adjusted, no loose screws, and perfectly rigid, for 11s. 6d.—**JOHN H. MONTAGU.**

4435. **Tripod.**—You want too much for the money. All the qualities you want cannot be had under 21s.—**KUKLOS.**

4436. **To Make Hand-Camera.**—Shew's Eclipse changing-box is the only one which would answer your requirements.—**KUKLOS.**

4437. **Book on Exposure.**—There is no book on the subject, and it would be impossible to give any actual help within the limits of an answer.—**MEMNON.**

4438. **Camera Making.**—Square bellows, back extension, swing back from centre, rising and falling front. The best form of slide is that made by Skinner, of Dereham, to be seen at Mothersill's, in Southampton Row.—**MEMNON.**

4439. **Fixing Prints without Hypo.**—I have tried it with so far good results. The formula is:—

Chloride of magnesium ... 15 grms.  
Alum ... 2  
Water ... 100 cc.

No one has tried it in place of hypo in the fixing bath. It can be very easily made, according to Mr. Wall, by dissolving about 120 grains of heavy calcined magnesia in 1 oz. of pure hydrochloric acid diluted with water. Perhaps he could tell you more about it.—**MEMNON.**

4440. **Vignette Glasses.**—There are two kinds—the French, made with tissue paper; or the ordinary, made of flashed orange glass, the centre of which is cleared with hydrofluoric acid.—**OSIRIS.**

4441. **Oil for Lantern.**—What lantern, dark-room or projection? Use the finest crystal Al paraffin, and dissolve 1 oz. of camphor in a pint.—**MEMNON.**

4442. **Toning.**—Gold always will deposit to some extent with the borax bath, and nothing will prevent it. Filter it out, and add a little more gold and borax.—**OSIRIS.**

4443. **Toning Matt Prints.**—Print deeper. Use a weak gold bath, or one that has been used for some time for ordinary prints. The ordinary baths are too strong. Wash well, and then tone.—**MEMNON.**

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us **BEFORE TUESDAY MORNING'S POST** if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—**ED: AM: PHOT.**

**NOTE.**—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.

**A. W. GOTTLIKE.**—The meaning of the paragraph is that no competitor, having won a bronze medal in a monthly competition, will be able to take a second bronze; he can only then compete for the silver medal.

**VERITAS.**—The hand-cameras you mention are good, but we should prefer No. 1 in the list you give.

**T. GLAZEBROOK.**—The only stipulation is that all the work is done by the competitor. See declaration on entry form.

**J. GRANT.**—The plates you mention are good, and will produce good negatives.

**PHIM.**—An endeavour is made to publish the *Reporter* by the first of the month, but the desire to get the latest items sometimes prevents this.

**J. C. H.**—The camera you mention is a very good one. The latter lenses would be the better; the manufacturers would pair them for you.

**SPIKE.**—They are quite as rich as any others at the price. Our choice is 3, 4, 5, 1, 6, 2.

**CORNWALL.**—Let us have the lenses up at your earliest convenience, and we will see what we can do.

**E. DICKSON.**—No. 2 is the best for portraits, No. 1 for architectural. The front or back combination would cover half-plate. 3 and 4: The latter set is superior. 5: No, you want no other lens at present. 6: A good instrument for the money. Always pleased to help you.

**ROGO.**—The diaphragms are numbered on a system introduced by Mr. T. R. Dallmeyer, in which the figure obtained by dividing the focal length by the aperture is squared and divided by ten. Your diaphragms marked  $7.5 = f/8$ , or U.S. 4;  $10 = f/10$ , or U.S. 5.6;  $15 = f/12$ , or U.S. 9;  $25 = f/16$ , or U.S. 16;  $50 = f/22$ , or U.S. 30.25;  $100 = f/33$ , or U.S. 68.08.

**HY. LEACH.**—Certainly, use a *nom-de-plume* if you like. See page 51, this week, for rules. Pleased to welcome you, and wish you success.

**J. E. R.**—We should very much like to see the "Holy Land" views, and shall be much obliged if you will send them on.

**T. D'AUBAN.**—The lines are obtained by using what is called a "lineature," or "line screen," which is a sheet of glass ruled with parallel or transverse lines; this is placed either in front of the plate in the camera, or placing it behind a transparency in front of the camera. One of the best books on the subject is Wilkinson's "Hand-book on Photo-Engraving, etc.," to be had from our publishers, price 5s. The subject is too copious to treat here.

**S. W. P. COWAN.**—Will answer next week.

**HIPPED.**—Add 40 gr. of quinol to the 10 oz.

**CHESHIRE.**—(1) Quite as good as can be expected for the money. (2) Yes. (3) A, the plate is over-exposed and under-developed; the print, under-printed and over-toned. B, over-exposed and under-developed; the stains are probably due to insufficient fixing. Still, you cannot be surprised at such poor results for first attempts. Let us see some more work in a month. Send good as well as bad work.

**THEA.**—You have got complete reversal of the image, which may be caused by two things—one, great over-exposure, which seems likely to be the cause in this case; and, secondly, by contamination of the developer with some hypo.

**A. RUSSELL.**—The interior suffers badly from halation. You ought to have backed your plate. It would have been better to have placed your camera exactly central with chancel arch and east window, and your camera was not quite straight. A little use of the swing back would have obviated this. The plate was well exposed.

**CLIFFORD D. FOTHERGILL (Biarritz).**—Your note to hand; we will reply next week.

**HENRY DUPUY.**—(1) Very fair. Print a little too dark. (2) Under-exposed. Coat the back of plate with matt varnish, and paint over rock on left with gamboge water-colour. (3) Good. Considering that you are only a beginner your work shows very good promise. Be a little more careful in trimming and mounting prints. What developer are you using—is it hydroquinone? Shall be pleased to see some more of your work.

**DERWEN DOTHU.**—We should place them in the following order, though any of them are good—5, 2, 3, 4, 1, 6.

**LIONEL THIRKELL.**—Certainly, it would produce such negatives. See our comments on competition pictures in the *Photographic Reporter*. It is possible, but awkward, to use it in the hand.

**BEGINNER.**—In answer to your first question, we should leave them in the order in which you have placed them. We should have no preference in regard to your second question.

**M. EGERTON.**—(1) Five or six times. (2) Perken Son, and Rayment sell them. (3) Lancaster's have a good form for both kinds of light; Perken, Son, Rayment. (4) Platt's; the Ludgate. (5) Mr. Cameron, architect, Inverness, is the patentee. (6) No.

**G. E. HERMON.**—The smaller would be the more convenient, and we should advise taking 1 and 2. In the event of your electing to take the larger we should recommend B for general work. In Italy, yes; we cannot speak as to the other.

**C. S. COBB.**—May we cut up one of the films to test? It looks rather like a deposit caused in the manipulations in some way.

**LEO.**—You did not mark your prints; we have done so. (1) You have no pure whites nor blacks in the print, consequently the same looks too grey and flat; it is a good subject. (2) About one inch of the foreground could be cut off with advantage; the print is again too flat and grey. (3) This is better; a better point of view is half-way up bridge looking to the left. (4) Good; here there is also too much foreground. You certainly want a little more artistic training before entering a competition. You have good apparatus and ought to turn out good work. Send us some more work in about six weeks.

**F. G. SHEFFIELD.**—No. 2 plate. We cannot understand your paper taking so long to tone; we can generally tone it in fifteen minutes. Write us again on this point, telling us exactly how you go to work. Almost all your prints are too dark. (1) Fair; what is the matter with the albumen of this print? (2) Too dark. (3) Nothing in it. (4) Bad; the black leaves at the top quite spoil it. (5) No principal object; the eye wanders all over it, wondering why it was taken; the print is again like No. 1, covered with millions of cracks. (6) Very fair; the foreground might well have been lighter. (7) Would have been good if the camera had been level and the paper had not shifted in printing, and had been mounted more carefully. (8) Very fair. (9) Good. (10) Nothing is sharp anywhere, and the print looks washed out; it could be made a picture. (11) Not at all bad for an evening effect, but everything has a double outline. (12) Good. (13) The vignetting spoils this. You must do better work before you can exhibit, and be more careful in printing and mounting.

**H. R. S.**—(1) A. Mercury bichloride, 10 gr.; bromide of potash, 10 gr.; water, 1 oz. B. Ammonia, 1 dr.; water, 7 dr. Stick to this. (2) Certainly; every negative should be varnished. (3) We take you at your word. You have got more money than wit. Keep your lens and your money. A good worker will turn out good work with a poor lens; you have got one of the finest lenses made. (4) Yes, all the detail, except in the heaviest shadows, should be so visible. You did not give us your address, so we cannot say whether you are in town or country; anyhow, we shall be pleased to see you any Monday, with specimens of your work, or, if you will send us some prints, we shall be pleased to give you some hints, and an idea whether you would stand a chance.

**J. F. HEWITT.**—Do not trouble yourself; with the quantity you use there is no waste. We frequently have to use 9 ft. per light for a two hours' show. How the professionals manage we don't know.

**SLEWON.**—The rule you want is as follows:—

Let  $D$  = the distance of object,  
 $f$  = the focus of lens,

$$\frac{D}{f} = \frac{f}{x}$$

or, as  $D - f : f :: f : x$ .

Or, as the distance of the object (measured from a point one focal length in front of the centre of the lens) is to the equivalent focus, so is the equivalent focus to the extra focal length required. In your case,

$$36 - 5\frac{1}{2} = 30\frac{1}{2}.$$

$$:: 30\frac{1}{2} : 5\frac{1}{2} :: 5\frac{1}{2} : x = 1\frac{1}{2}\text{ in.}$$

Practically to take an object at 3 ft. the distance between lens (optical centre) and sensitive surface must be  $5\frac{1}{2} + 1\frac{1}{2}\text{ in.} = 6\frac{1}{2}\text{ in.}$

**G. H. PRESTON.**—(1) Yes, it is a good instrument.

(2) Yes. (3) The angle included would be 66 deg.

(4) The Iris are more convenient.

## Quarterly Examinations in Photography.

### QUESTIONS.

- Describe the methods for testing a lens for chromatic and spherical aberration, the aberration of form, the aberration of thickness, and the aberration of position of lenses.
- What is the meaning of the terms chemical and visual foci? Explain the principle of constructing an achromatic doublet from two uncorrected lenses, if this can be done?
- What is a "flare" and a ghost, and how are they caused?

(Latest Day for Answers—January 26th.)

### RULES.

- Answers must be received on the morning of the Monday week following the publication of the question.
- All answers must be preceded by the question, and should be written on one side of the paper only.
- A *nom de plume* may be used, but in every case the full name and address must also be given.
- Answers must not exceed 250 words, unless otherwise stated by the examiners.
- Those desirous of competing must apply to have their names entered, as these examinations are intended to encourage the study of the theory and practice of photography. Authorities upon photographic matters and contributors to the photographic journals will not be allowed to compete.

Marks will be given for all answers, and when possible, the three best answers will be published. Three prizes will be awarded at the end of each quarter.

All communications to be addressed:—  
"EXAMINATION DEPARTMENT,"

AMATEUR PHOTOGRAPHER,  
1, CREED LANE,  
LONDON, E.C.

## Lantern Slide Exchange.

**NOTE.**—There is no CHARGE for insertion in this column. All announcements must be received by Tuesday morning.

Will exchange twelve coloured views, "Heroes of the Lifeboat," twelve coloured views, "Old London," and thirty-six plain slides of views in Kent, for amusing or comic slides for children.—Crossley, Rodley, Leeds.

Will exchange a dozen architectural or landscape slides for the same number of figure studies.—H. A., 71, Paulet Road, Camberwell.

Have a dozen river scenes which I should like to exchange for same number of animal studies.—D. Williamson, 156, Amhurst Road, N.E.

## Sale and Exchange.

**RULES.**—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny Stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

**REPORTING UPON APPARATUS.**—The Editor of the AMATEUR PHOTOGRAPHER will be pleased to report, to any intending purchaser, upon apparatus, etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the seller to him to the offices of the AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending BUYER to pay a fee equivalent to a commission of 2½ per cent., the minimum being one shilling, upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the SELLER. As far as possible, the Editor will undertake to send a report within TWO DAYS of receipt of goods.

### DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

Advertisements can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 6d. to cover postage.

**N.B.**—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

**Camera.**—Camera for sale, nearly new, cheap have no use for it.—Mrs. Elder, Diamond Cottage, Balcombe.

**Cameras, etc.**—Half-plate camera (Wood, Cheap-side), no lens, three double backs, waterproof lock-up case, tripod (in case), and stand; £3; cost more than double.—Brown, 176, High Street, Camden Town, N.W.

**Cameras, Lenses, etc.**—1890 Lancaster's Instantograph camera, slide, tripod, 7 by 5 R.R. lens, new, 67s. 6d.—R. Henry, 2, Hawthorn Villas, Slad Road, Stroud, Glos.

First-class quarter-plate camera, reversing swing-back, rack adjustment, double extension, six double dark-slides (two spare fronts), Optimus rapid rectilinear 5 by 4 lens, two-fold tripod, waterproof case, lamp, folding rack; £29.—Burton, 53, Jasmine Grove, Anerley.

For sale, Underwood's quarter Instantograph camera, Ross' landscape lens, Lancaster's Universal tripod, changing box, two dark-slides, developing dishes, etc.; price £3; deposit.—Willis, 26, Duke Street, Chester.

Whole-plate Blicliff, three double backs, Optimus lens, Kershaw shutter, tripod, waterproof case, holds the lot; £12; on approval. Wanted, Shew's hand-camera.—Robert J. Evans, Cromac Works, Belfast.

Thornton's 10 by 8 camera, Ross' rapid symmetrical 10 by 8, tripod, etc., cost £24; good square bellows, 6½ by 4½, taken in part exchange, Watson's Premier preferred; approval; particulars.—Walton, Churchtown, Southport.

Watson's whole-plate Premier camera and tripod, three double slides, R.R. and W.A. lenses and accessories, new last year; offers wanted. Enlarging apparatus, 75 candle-power lamp.—W. Jones, Enfield House, Uffculme, Devon.

Lancaster's 1890 half-plate International camera, lens, and tripod, two dark-slides, little used; £4.—McGibbon, Chemist, Roinburgh.

Half-plate bellows camera and lens, rack movement; 35s.—Holt, 85, Church Street, Church.

**Hand Cameras, etc.**—Fallowfield's Faeile hand-camera, very latest pattern, cost £6 10s.; R.R. lens, four stops, covered morocco leather, only three months old, guaranteed perfect as when new; price £5.—Replies to No. 94, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

New 5 by 4 Shew's Eclipse hand-camera, with three double backs and Wray's 5 by 4 R.R. lens, with rack adjustment and Shew's Eclipse shutter; cost over £8; price £5.—No. 99, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

**Lenses.**—Ross' half-plate rapid symmetrical lens, with diaphragms, complete; £4; bargain.—Barton, Morriston, Elgin.

Quarter Euryscope, f/6, R.R. lens, as new, 19s. 6d.; 7 by 5 R.R., working at f/8, 21s., with Waterhouse stops.—John Slade, Slad Road, Stroud, Glos.

Levi's portrait lens, 15s.; lantern objective, 10s.; Lerebours and Secretan's quarter-plate portrait lens, 20s.; quarter-plate portrait lens, 15s.—F. R. Upcott, 135, Brigstock Road, Thornton Heath. (Can be seen at the offices of the AMATEUR PHOTOGRAPHER.)

Sell Lancaster's whole-plate Instantograph lens and stops; 25s.—Vicarage, Kirby Grindalythe, York.

Morley's whole-plate landscape lens, 10s.; also 5 by 4 wide-angle rectilinear, by private maker, 26s.—Bennett, 43, Mitchell Street, E.C.

Half Optimus rapid rectilinear lens and Self portrait, covers half-plate sharp; 28s.—2, College Street, Northfleet, Kent.

**Sundries.**—Set of brass fire irons, full size, very pretty pattern, suitable for dining or drawing room, nearly new; cost 15s.; price 8s. 6d.; approval.—A. Henry, 4, West Brixton, S.W.

For sale, complete enlarging set, Marion's 7 in. condensers, 15 by 12 and 17 by 23, dishes, lens, and sundries, price £5; also Optimus detective camera, Euryscope lens, six double backs and stand, price £5; approval; deposit.—Barrow, Argyle Terrace, Belgrave Road, Leicester.

"Photographic Quarterly," first four numbers; what offers?—Green, 29, Woodbridge Road, Ipswich.

AMATEUR PHOTOGRAPHER, 269 to 325, clean, best offer.—Dunn, 9, Whitebaugh Terrace, Paisley.

AMATEUR PHOTOGRAPHER, 140 numbers, also half-

plate camera; will exchange the lot for quarter-plate camera.—J. Graham, New Lanark.

For sale, quarter-plate apparatus, frame, and dishes for cash, or will exchange for Stirn's improved Secret vest camera, frame, and dishes, else for something useful. — Apply, B. Dry, 3, St. Margaret's Street, Canterbury.

### WANTED.

**Burnisher.**—Half-plate burnisher; exchange handsome pair of opera glasses in case.—D. White, Stores, Ardington, Wantage.

**Cameras.**—Half-plate camera, square swing-back, etc., must be good and cheap, for cash and miscellaneous collection of lantern slides.—J. Harriman, Henley-on-Thames.

**Stereoscopic camera,** Chadwick's preferred.—No. 93, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Half-plate camera, complete; exchange 8-air musical box, with bells, value £3.—Frederick Sharpe, Oakham.

Quarter-plate Le Merveilleux camera (Lancaster's); exchange for Griffith's guinea and half detective camera; letters only.—John T. Roberts, Market Vaults, Abergele, North Wales.

**Camera, etc.**—Watson's Acme camera, 7½ by 5, complete with turntable and tripod.—No. 98, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

**Cameras, Lenses, etc.**—Half-plate camera, R.R. lens, tripod, three double backs, etc., complete.—Rosenath, Enfield.

Half-plate camera and lens, in exchange for good 5-stringed banjo, black walnut neck, sycamore and ebony veneered finger board, nickel silver rims and brackets, ivory keys, Roger Head, complete with Dallas's banjo chart, in waterproof case, equal to new.—No. 98, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

10 by 8 modern camera, slides, and 9 by 7 Eury-scope.—D. Jack, 15, South Frederick Street, South Shields.

Half-plate camera, with double extension, usual adjustments, and slides; lens optional.—Alpha, 2, Halford Terrace, Richmond, Surrey.

**Lenses.**—Cabinet portrait lens (by Ross, Grubb), must be in good condition.—L. Pabst, Clifden, co. Galway.

Half or full plate, good, cheap lens.—C., care of Neelds, 121, High Street, Peckham.

Ross' whole-plate rapid symmetrical, cheap.—Vicarage, Kirby Grindalythe, York.

Lenses, 7 by 5 Optimus Eury-scope; exchange 10

by 8 camera, double slide, all improvements.—Dukes, Llangadoc, South Wales.

**Lens, etc.**—Quarter-plate fixed focus lens and shutter.—T. James, 60, Broad Street, Worcester.

**Magic Lantern.**—Magic lantern, 3½ in. slides.—Lowest price to S. Kirkham, Court Place, Carlisle.

**Negatives.**—The loan of negatives, scenes in connection with haymaking, to make lantern slides, for a charitable object; all carriage paid, or messenger sent to London Hon. Sec.—No. 97, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

**Sets.**—12 by 10 modern set, complete, with first-class R.R. and W.A. lenses.—State full particulars and lowest cash price to No. 92, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

**Sundries.**—Part I of "Encyclopedia of Photography." Red Hill Cottage, Chislehurst, Kent. Vols. ii. and iii. of "Camera," good condition, clean, for cash.—Edward Lee, 13, West Hillary Street, Leeds.

Cases for storing quarter-plate negatives.—Hewerton, Hill Top Lodge, Ulverston.

Commercial man (with some knowledge of photographic apparatus), travelling through principal towns, to call on photographic dealers, on commission.—No. 95, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

**Tripod.**—Tripod, for half-camera, cheap.—F. J. Thornton, 15, Bromley Road, Beckenham.

**CORRESPONDENCE SECTION.**—Anyone wishing to communicate with Contributors can do so by forwarding such Communication in stamped envelope under cover to the Editor, **Amateur Photographer**, 1, Creed Lane, Ludgate Hill, London, E.C.

### SPECIAL COMPETITION,

ILLUSTRATING THE

### "SEVEN AGES OF MAN,"

As described in Shakespeare's Play "AS YOU LIKE IT" (Act II, Scene VII.)

FIRST PRIZE ... ..	GOLD MEDAL.
SECOND " ... ..	SILVER MEDAL.
THIRD " ... ..	BRONZE MEDAL.
FOURTH " ... ..	CERTIFICATE.

**CONDITIONS.**—That the Photographs shall be from life, in the costumes and with the surroundings of ordinary daily life. Photographs in which the subjects have been "got up" will be rejected.

The prints may be by any process. The prize photographs will become the property of the Proprietors of the **AMATEUR PHOTOGRAPHER**, who will have the right to call for the use of the negatives.

All the work must be done by the Competitor. The photographs are to be mounted, and the title, with quotation from the play

neatly written or printed upon the mount. Each photograph is to be numbered in the order of the "Ages."

All contributions must be received on or before Saturday, 28th February, 1891, addressed:—"Seven Ages of Man,"

EDITOR:—AMATEUR PHOTOGRAPHER,  
1, Creed Lane, London, E.C.

### "AMATEUR PHOTOGRAPHER" MONTHLY LANTERN SLIDE COMPETITION.

Prizes:

SILVER AND BRONZE MEDAL AND CERTIFICATE.

	LAST DAY.
LANDSCAPE, SEASCAPE, AND RIVER SCENERY .. ..	Jan. 22nd.
Second Competition.	
PORTRAITURE AND FIGURE STUDIES. . . . .	Feb. 19th
Third Competition.	
ANIMALS AND INSTANTANEOUS PICTURES. . . . .	Mar. 19th.
Fourth Competition.	
ARCHITECTURE (INTERIOR AND EXTERIOR). . . . .	April 16th.

The Competitions will be resumed in September.

**CONDITIONS.**—Each competitor must send in two slides. Any competitor winning a Silver Medal will be disqualified from entering the subsequent Monthly Lantern Slide Competitions. The winner of Bronze Medal or Certificate can only compete for the higher prize or prizes in subsequent competitions.

The awards will be published in the **AMATEUR PHOTOGRAPHER**, and a general note given upon each competition.

The slides of competitors which do not gain a prize will be divided into three classes, according to merit, and the competitors' names, etc., published in the *Photographic Reporter*.

All slides entered for competition to become the property of the **AMATEUR PHOTOGRAPHER**.

**NOTE.**—The slides will be passed through the lantern at the Office of the **AMATEUR PHOTOGRAPHER** on the Monday evening in each month immediately after the date upon which the slides have to be received.

Particulars as to admission, and entry forms, may be had by forwarding stamped directed envelope to

THE EDITOR,  
"AMATEUR PHOTOGRAPHER,"  
1, CREED LANE, LONDON, E.C.

### "AMATEUR PHOTOGRAPHER" MONTHLY PHOTOGRAPHIC COMPETITIONS.

THE Proprietors of the **AMATEUR PHOTOGRAPHER** offer, Monthly, two prizes consisting of a

SILVER AND A BRONZE MEDAL (WITH RIBBON AND CLASP), for the best and second-best photographs sent in to each of their Monthly Competitions. The subject of the Competitions will be as follows:—

No. 21.—ANIMALS AND INSTANTANEOUS SUBJECTS ... ..	Feb. 2.
" 22.—SNOW AND HOAR FROST ... ..	Mar. 2.
" 23.—INLAND SCENERY ... ..	April 2.

Only one print is to be sent in; the negative of the prize pictures shall be at the service of the Proprietors, and all the prints sent in shall become the property of the Proprietors of the **AM. PHOT.**

All photographs for any of the above competitions will be acknowledged in the columns of the **AMATEUR PHOTOGRAPHER**.

All photographs criticised, and several reproduced every month, in the *Photographic Reporter*.

Entry forms on receipt of stamped addressed envelope. Apply to the Editor **Amateur Photographer**, 1, Creed Lane, Ludgate Hill, London, E.C.

## OUR VIEWS.

"To hold as 'twere the mirror up to nature."—Shakespeare.

WE have just received a communication from Mr. S. G. Buchanan Wollaston advising us that a photographic exhibition will be held at the Crystal Palace from the 13th of April to the 2nd of May. The exhibition will be chiefly devoted to photographs, lantern slides, and transparencies. It is expected that some of the manufacturers will take stalls for the exhibition of their goods. Further particulars will shortly be announced. We feel that it will give much satisfaction to many of our readers who are either professional or amateur photographers, to learn that the Crystal Palace Company have again arranged a photographic exhibition. We hear that the exhibition will be under the management of Mr. Wollaston.

A PHOTOGRAPHIC exhibition is shortly to be held at St. Petersburg, on, we understand, a very extensive scale.

THE Hon. Secretary of the Camera Club, Mr. George Davison, has kindly forwarded us a copy of the preliminary notice of the 1891 Photographic Conference. It will be held, as heretofore, in the theatre of the Society of Arts, on Tuesday and Wednesday, April the 7th and 8th, under the presidency of Captain W. de W. Abney, C.B., R.E., D.C.L., F.R.S. On the evening of Monday the 6th, a smoking concert will be given at the club-house, and an exhibition of members' photographic work will be opened. On Tuesday the 7th, papers will be read in the afternoon from 2 to 5.30, and in the evening an exhibition of lantern slides will be given. On Wednesday the 8th, the reading of papers, etc., will be continued at 2 p.m., and at 7.30 the members will dine together. We would especially call attention to the fact that all photographers are invited to attend and take part in the discussions upon the papers read during the Conference at the Society of Arts. The complete programme will be issued at a later date.

WE shall hope to be in a position next week to publish the awards in connection with the "Holidays with the Camera."

THE slides contributed to the AMATEUR PHOTOGRAPHER Monthly Lantern-slide Competitions will be passed through the lantern at our offices on Monday next, commencing at 5 p.m. Competitors are invited to attend, and will be admitted upon presentation of visiting card.

THE President (Herr C. Srna) of the Vienna Club of Amateur Photographers has sent us a reply to a letter

published in our issue of the 2nd inst., upon the Exhibition. It is to be regretted that the prospectus does not clearly set out that the photographs exhibited must be the sole work of the exhibitor. In this country it is well known that until the AMATEUR PHOTOGRAPHER insisted that all photographic work should be done by the exhibitor, many called in the aid of professionals, not only to retouch, but to develop, print, tone, etc. We may add that the writer of the letter complained of is not an Englishman, hence he has some slight difficulty in expressing himself in our language. He is an amateur photographer of very considerable ability, and his photographs have at different times received high commendation.

IN the last issue of the AMATEUR PHOTOGRAPHER we made an appeal for a hand-camera for two ladies who are practising photography. We are very pleased to state that Messrs. Talbot and Eamer, of 7, Exchange Street, Blackburn, have written to us: "We have pleasure in presenting the ladies with one of our 'Talmer' hand-cameras, and have sent same to you this day, carriage paid." We shall be delighted to forward the "Talmer" hand-camera to our correspondents, who are at present residing at Avignon, France, and we are sure that they will suitably acknowledge, and be very grateful for, Messrs. Talbot and Eamer's useful present.

THE question of copyright in photographs having recently attracted much attention amongst amateurs, it may be of interest to our readers to know that the only portrait of himself in existence, when Father Damien died, was a photograph not from life, but from a drawing. This fact was not generally known, however, and the photograph in question was copied, reproduced, and published in a whole host of newspapers in due course. Directly after publication, however, the man who had made the original drawing came down upon the proprietor of every newspaper which had infringed his copyright. He, it is said, imposed his own terms, asking as much as £50 in some cases, and the money was paid because it was felt to be cheaper to pay even £50 than to go to law with a virtual certainty of being defeated.

THE recently-formed Dunedin Photographic Society declines to have professionals as ordinary members, or to take any part in the business of the meetings, but, thinking at the same time that mutual benefit might be derived by the occasional association of the two, it allows professionals to be honorary members, which permission has

been taken advantage of by several professionals in the city. The rule runs as follows:—

"The Society shall consist exclusively of amateur photographers and honorary members. The designation 'amateur photographer' shall not apply to any person who sells any print or negative of his own or his employes' production, or does any photographic work for any remuneration whatever. But it may apply to a dealer in photographic apparatus or material, who is not disqualified by the sale of his own or his employes' work."

THE Putney Amateur Photographic Society is enterprising, to say the least of it, and has had a handbill printed and circulated all over its district, calling attention to the claims of the Society in the following terms:—

"PUTNEY AMATEUR PHOTOGRAPHIC SOCIETY.—President, the Hon. Baron Pollock; Vice-Presidents, Mr. T. Gilbert, Rev. L. Macdonald; Council, Mr. Charles Ballard, Mr. E. V. Barrett, Mr. W. H. Congreve, Dr. J. F. Farrar, Mr. W. F. Gorin, Mr. J. C. Leman, Mr. M. G. E. Manifold. A society under the above title has been formed in this district. The meetings are held fortnightly, on the second Wednesday and last Saturday in each month. Annual subscription, 10s. Ladies and gentlemen desirous of joining are invited to communicate with any member of the Council, or with Chas. Ballard, Hon. Secretary, 46, Erpingham Road, Putney."

HERE is a great opportunity for those of our readers who like scientific experiment and investigation. We have all heard of spirit photographs, and many of us have either made them or got them when we did not want them, but now we have Prof. Russell Wallace writing in the American review, *The Arena*, as follows:—

"Perhaps the most remarkable series of experiments ever made on this subject are those carried on during three years by the late Mr. John Beattie, of Clifton, a retired photographer of twenty years' experience, and Dr. Thomson, M.D. (Edin.) a retired physician, who had practised photography as an amateur for twenty-five years. These two gentlemen performed all the photographic work themselves, sitting with a medium who was not a photographer. They took hundreds of pictures, in series of three taken consecutively at intervals of a few seconds; and the results are the more remarkable and the less open to any possible suspicion, because there is not in the whole series what is commonly termed a spirit photograph, that is, the shadowy likeness of any deceased person, but all are more or less rudimental, exhibiting various patches of light undergoing definite changes of form, sometimes culminating in undefined human forms, or medallion-like heads, or star-like luminosities. In no case was there any known cause for the production of these figures. I possess a set of these remarkable photographs, thirty-two in number, given me by Mr. Beattie, and I was personally acquainted with Doctor Thomson, who confirmed Mr. Beattie's statements as to the conditions and circumstances under which they were taken."

THE Eisteddfod, which is to be held next July at Blaenau-Festiniog, will prove a little more attractive for amateurs than previous meetings have done. The Bards are holding out inducements to amateur photographers to visit their lovely country. There is to be a competition open to amateur photographers, and a silver medal will be awarded for the six best photographic views (half-plate) of North Wales scenery. The judge is Mr. J. Oswell Bury, Wrexham, and further particulars may be obtained from Mr. H. Hughes, Eisteddfod Secretary, Blaenau-Festiniog.

THE Adelaide Amateur Photographic Society is by no means behind the times, so far as experimental photography is concerned. At a recent meeting Mr. Clough gave an exhibition of flashlight photography with magnesium powder. The plate exposed was then developed and gave a negative of good printing density, showing fair detail. At

the same meeting the subscription was reduced from £1 to ten shillings.

MAJOR E. J. BECHER, R.A., writing in reference to our note of last week about the adventure of Mr. Davis, Chief Engineer of the *Benbow*, at Malta, says:—

"It may interest your readers to know that officers of all mail steamers have been requested not to allow passengers to take photographs of any British fortress."

THE entry forms for future Monthly Competitions will, we hope, be ready during the course of next week, when copies shall be forwarded in answer to the numerous applications we have received since our list was published.

THE secretaries of clubs would do well to send in applications for the loan of our Monthly Competition prints, several of which have just returned from circuit. There are available amongst others, "Inland Scenery," "Seascape and River Scenery," "Landscape with Figure," "Figure Studies," and "Instantaneous." The "Travelling Student-ship" prints are still available.

THE employes of Messrs. Percy Lund and Co. spent a very pleasant evening together on Saturday last, on the occasion of their annual social gathering. After partaking of tea at five o'clock, a couple of dramatic sketches, "Wanted, a Servant" and "The Lost Umbrella," and a comedietta, "Outwitted," were performed, and the remainder of the evening was divided between songs, recitations, and games of various kinds.

THE members of the photographic society in connection with the Friends' Meeting House, Stoke Newington, held their annual conversazione on the 14th. A very pleasant time was wiled away by means of the lantern, through which about 200 slides, made by the members, were passed. They included views in America, Norway, Sweden, Italy, and England. There were a considerable number of prints hung around the walls.

MR. TEBBUTT, the famous amateur skater, who has just returned from Holland, is an enthusiastic photographer, and during his recent skating tour he carried a hand-camera with which he secured a number of photographs of skaters in the various attitudes common to that class of persons, some of which are very amusing.

THE death of Surgeon-General T. Graham Balfour, M.D., F.R.S., honorary physician to the Queen, recalls to our recollection the fact that in his address as President of the Royal Statistical Society, 1889, he devoted a large portion of his attention to a criticism of the "Recidivist" system, which owes much to photography as a means of the identification of criminals. It may be remembered that Dr. Balfour was one of the deputation who had the advantage of a full exposition of the Bertillon system from the Chief Commissioner of the French police.

**New "Constable" Etching.**—The well-known picture, "The Jumping Horse," by John Constable, R.A., which now hangs in the Diploma Gallery, Burlington House, has been admirably etched by Mr. William Hole, R.S.A., and prints are promised shortly by Messrs. Dowdeswell's. Despite the difficulties presented in this picture, the etcher has reproduced the distinguishing features of the picture with much fidelity. The sky is particularly admirable.

## ECONOMICAL DEVELOPING DISHES.

SUCH dishes as described in the preceding article, namely, those made by folding the four edges of sheets of paper or cardboard, and securing the corners by means of clips, may be very advantageously fashioned out of sheet tin. As a tray made of such material would be more permanent than those previously alluded to, it is worth while, if possible, to solder the corners, instead of merely holding them together by means of clips. In the employment of tin or other metals it is a *sine qua non* that they be enamelled or painted, to prevent the solutions from attacking them. A tin dish such as above referred to, coated with Aspinall's white bath enamel, will stand most acid solutions and also weak alkaline ones. After a while—from six to twelve months—the dish will need a fresh coat.

In place of making a metal dish, the amateur may often profitably adapt one intended for other purposes. For instance, there are frequently various forms and sizes of flat rectangular baking dishes to be obtained at oil shops and hardware stores at prices far below that of ordinary porcelain or vulcanite. The writer has one of such before him which just takes a half-plate. The cost of this, made in tin, was twopence-halfpenny. A farthing's worth of paint will make it for many purposes quite as serviceable as one costing three times the price.

As a further instance of the way various articles can be utilised in the interest of economy, at a recent demonstration on enlarging, some 15 by 12 bromide prints operated upon were, after development, acidified in a red enamelled tea-tray costing fourpence-halfpenny. A porcelain tray sufficiently large would run into five or six shillings.

What is oft-times a very convenient makeshift is to employ the ordinary cardboard boxes in which dry plates are usually sold. In order to do this, the porous cardboard must, of course, be rendered impervious to liquid. Various means of accomplishing this may be adopted, each particular method having its advantages and also its disadvantages. The simplest procedure of all is to saturate the cardboard tray with wax or grease.

A piece of ordinary composite candle, or the grease from a child's night-light, is melted, the box to be operated upon is warmed, the melted grease is run into it and caused to saturate all parts of the inside. As soon as it is cold, which will be a matter of seconds, the dish may be used. The above is so primitive a procedure that little surprise will be felt by the reader on being told that in use such a dish is none too satisfactory. Many of the solutions are apt to attack the grease, the acid ones least of all. Moreover, unless carefully handled, the dish is very short-lived, the corners giving out very easily. Still, this employment of grease is often a most convenient expedient. It takes but little time, and the materials are always available.

In a recent number of the AMATEUR PHOTOGRAPHER, paraffin wax for waterproofing cardboard dishes was advocated in the following terms: "Cut some paraffin wax into pieces the size of a nut, place on bottom of dish, and by means of a flat iron, used hot, but not too hot, melt them, and work the wax into corners and bottom; repeat this three times. Be careful not to scratch the dishes when in use" ("Aletes," p. 460, vol. xii.)

There are several other far more durable preparations available, which are better than either of the two foregoing, but which have the drawback of not being so easily procured nor so simply applied. First of these is the following: Heat coal-tar in bain-marie to 100 deg. F.; to this add the best vulcanised rubber in shreds, in such quantity that when dissolved the resulting mixture shall be of the consistency of thick treacle. A very similar preparation to the above is that which goes by the name of Brunswick

black, which probably contains wood-naphtha and coal-tar. The above will stand acids, ferrous oxalate solution, and weak alkalies.

Another useful and always available article is what is known as sealing-wax varnish. This is made by breaking a stick of good-quality red wax and covering the pieces, previously placed in a bottle, with methylated spirits; in a short time the wax will be found to have got quite soft. The bottle being now well shaken, the wax becomes thoroughly incorporated with the spirit. On applying the mixture to cardboard, wood, glass, etc., the alcohol speedily evaporates, leaving a thin film of sealing wax adhering to the material operated upon. There are two main objections to this varnish; in the first place it is apt to crack and either scale, or allow a leakage; secondly, all solutions containing alcohol, ether, chloroform, or similarly acting solvent would attack the wax. But in spite of these weak points, the above is a most useful and handy preparation for the worker to have by him; it will keep almost indefinitely in a well-corked bottle.

Perhaps the best solution for making a dish water-tight is the following:—

Asphaltum .. .. .	4 oz.
Mineral naphtha .. .. .	10 „
India-rubber solution .. .. .	4 drm.

The rubber solution referred to is that used by cyclists to repair their tires. Those who prefer can make the solution for themselves, as follows:—

India-rubber .. .. .	1 drm.
Mineral naphtha .. .. .	1 oz.

Dissolve the former in the latter.

It is here necessary to give a serious caution to all who contemplate using the foregoing formulæ, inasmuch as mineral naphtha throws off a highly inflammable and dangerous vapour; certainly no light should be in the same room where the naphtha is being manipulated. It will be within the memory of our readers that the disastrously fatal fire near Smithfield was caused by the careless use of the above compound.

The mixture when the ingredients have been well incorporated may be applied by means of a brush or floated over the article it is desired to coat. The amateur need not, of course, confine his attention to utilising old plate-boxes, but avail himself of any cardboard box lids which he can lay hands on, these may be procured for the asking at any draper's or fancy shop. For large sizes, wooden box lids can, with a little ingenuity in stopping the cracks where the pieces join, be most successfully coated with the above, and will result in the production of very serviceable trays.

The hints we have given by no means exhaust the subject, and we may in a subsequent number further supplement them.

## Letters to the Editor.

### THE VIENNA PHOTOGRAPHIC EXHIBITION.

SIR,—In the AMATEUR PHOTOGRAPHER for January 2nd I find an anonymous letter. This communication is calculated to discredit our this year's exhibition, while attacking that of the year 1888.

Under other circumstances I should not answer such an attack, but naturally, Sir, we are by no means indifferent as to your opinion of our doings. Further, we desire to convince you and all English professionals and amateurs that our exhibitions are based upon a firm foundation. This year our exhibition will be confined to strictly artistic pictures, and is intended to show whether photography has an artistic side at all or not, and also how far at present photography has advanced in regard to picturesque effect and artistic conception.

Photography, which hitherto has always been regarded by

painters with an evil eye, they altogether denying the possibility of artistic effect in it; photography, I say, has recently (in no slight degree, through the influence of amateurs) assumed a more artistic tendency, and the Club of Amateur Photographers in Vienna, inspired with the thought of proving the possibility of artistic work, issued the invitation to take part in an exhibition founded on the above-mentioned idea. It was impossible that jurors who are themselves photographers should declare the proof that the exhibition is intended to bring simply and solely because that would be judging of their own hobby or profession. In order to get an incontestable opinion on the point, it was necessary to choose as jurymen only artists, *i.e.*, painters, etc., as they alone, as opponents of photography on principle, seemed called to pronounce on the possibility of art in photography.

Thanks to the indefatigable efforts of Imperial Councillor Professor Fritz Luckhardt, the club has succeeded in forming a jury of painters, etc., who will do their duty most conscientiously, and who are free from prejudice for or against photography.

Professor Luckhardt, himself an eminent photographer, was chosen for the purpose of explaining certain appearances caused by the nature of photography itself. On the jury he will be a technical adviser, and is certainly a person to inspire every amateur and professional of whatsoever country with the fullest confidence. It is self-evident that, in judging the pictures, the artistic idea, the conception, the posture, etc., will be determinative. That our exhibition programme does not contain the demand that the exhibitor should be the producer of the picture, merely proves that from the very first we deemed this a matter of course.

Experience and the most extensive technical knowledge must go hand in hand with artistic perception to achieve what is called art in photography, and, therefore, we almost feel ashamed of asking the competitor how much of it he has done himself; but, nevertheless, have determined to do so.

In this sense we understood our programme, and considered a passage requiring an express declaration as to how much of the work the exhibitor himself has done as a degradation, nay, well nigh as an insult for amateur and professional alike.

Your correspondent seems only to desire to wilfully distort a slip of the pen in the German circular. Another assertion of his, namely, that the Exhibition was planned to exclude professionals, is not correct; for the English programme (the first to be printed and sent out) does not contain any such passage, nor was such a thing mentioned by the Exhibition Committee. The English programme is headed "International Photographic Exhibition, etc.," which wording clearly proves there was no intention of excluding the work of professionals.

But the accusations against our exhibition of 1888 I emphatically declare to be untrue, for it will not do for men who hold the first position here as photographers, and who belonged to the jury then, men such as Professor Dr. Eder, Professor Luckhardt, Government Councillor Volkmer, etc., to be accused of partiality.

To your correspondent's quoting the well-known American amateur, Mr. Stieglitz, as a judge of Continental affairs, I raise no objection, for a lengthened stay here fits him for it.

A letter just to hand, dated New York, December 8th, 1890, says of our exhibition, "I congratulate you on the jury; it pleases me. The exhibition will doubtless be one of the most important."

To bring this last about is not in our power, but in that of the exhibitors.

Hoping that nothing may mar the harmony which has hitherto existed between English editors, amateurs, and professionals on the one hand, and Austrian disciples of Daguerre on the other, I am, Sir, yours truly,

CHAS. SERNA (President).

Club of Amateur Photographers, Vienna,  
January, 1891.

\* \* \* \*

#### EDINBURGH EXHIBITION.

SIR,—In your report, January 9th, of the Edinburgh Exhibition, your district editor is very severe on the silver-medal picture in Class XX. In his opinion, it is "by no means a pleasing picture, being hard and unfeeling in tone," but he further adds, however, that the jurors' decision is "in all respects" superior to his. May I say that the decision of the jurors has only confirmed the opinion of the first seascape painters of the day, Mr. Henry

Moore, A.R.A., who considers the picture in question one of the finest he has ever seen. As to not having sent in the original negative, if the enlargement was in all respects worthy the first place it would show very little nobility on the part of the jurors to withhold the medal for so small an oversight. But the original was sent in with the enlargement. The fault was not mine.—Faithfully yours,

F. H. WORSLEY-BENISON.

\* \* \* \*

#### PHOTOGRAPHIC TONALITY.

SIR,—I should not have troubled you again on this subject but for the letter in your last issue, from which it would seem that, however many hours your correspondent may spend each week in perusing the AMATEUR PHOTOGRAPHER, he either devoted a very small fraction of his time to Mr. Buck's article and my letter, or, as is very likely, we have not made ourselves sufficiently explicit. In order to remedy this defect, let me begin by assuring "Gradation" that the question is not, as he seems to think, primarily one of slow *v.* fast development, on which footing alone he treats it, but of reducer *v.* alkali. To show that "Gradation" has been, if he will permit me to say so, somewhat careless in arranging his data, I have merely to point to his eulogium (a thoroughly well deserved one, by-the-by) of your formula for snow scenes, by which he plays my hand for me. Had he referred to the formula he would have seen that although the alkali is present in full strength, *i.e.*, about the usual proportion to the ounce of solution, the pyro, on the contrary, is reduced to 1/15th or even 1/20th of the ordinary amount to start with. So that a development with strong alkali and weak reducer need not be a fast one. Now I will ask "Gradation" a question. Has it ever occurred to him that during the time a plate is being exposed, there arrives a moment when the worst lighted details are sufficiently impressed upon the film? Well, then, that is the moment of correct exposure. Now there can be no doubt that anything short of or beyond this is detrimental. I also maintain that for every make of plate, the normal developer is adjusted to suit this absolutely correct timing, so that any tampering with the constituents will spoil the gradation of a plate exposed in this manner. Now does "Gradation" see what Mr. Buck and myself meant by "cutting exposure short," just sufficient," etc.? Your correspondent ignores correct timing. He can think of nothing but under and over exposure! Should these things be? Why detract from the beauty of many properly timed plates, because, forsooth, you are afraid you may have over-exposed? This system of long timing is the curse of the day. For my part, I have suffered so much from it that I would sooner run the risk of spoiling six plates by under-exposure for the sake of one correct and technically perfect negative, than I would have all the seven over-exposed, made presentable (or even good) but not what they should have been. I am far from believing in slow development; for instance, the snow scene formula has yielded me a splendid negative where there was great range of distance and contrast, even without snow. I have also done very well with the "building-up system" used by the Rev. Mr. Hare in his silver medal pictures in 1885. In the latter, the pyro and ammonia are each divided into three equal parts. You commence with one-third of each and add the remainder, in the case of correct exposure, by equal thirds till you arrive at the normal strength. This is a capital method in cases of uncertainty, as errors can easily be corrected and the first application contains only the proper proportion of pyro to ammonia. But I say again, away with the system of starting with full strength pyro and weak alkali, except in two cases—over-exposure, or where the subject is one on which for my part I should never dream of wasting a plate, *viz.*, a flat, dull, uninteresting view with no contrast even to the eye, and consequently no beauty. Contrast, even violent contrast, is of the very essence of artistic work, but not exaggerated, as "Gradation" would have it.—Yours, etc.,

ISIS.

SIR,—Through serious family sorrow, I am unable now to reply to "Gradation's" letter, but will gladly do so as soon as possible.—Yours faithfully,

THOS. L. BUCK.

**Circulating Photographic Club.**—Mr. J. T. Cook, of Edina, Stoney-gate, Leicester, wishes us to state that he has a vacancy for one member in a Circulating Photographic Club of which he is Secretary, and will be glad to hear of anyone desirous of joining.

## The Construction and Use of Photographic Lenses.

BY CLEMENT J. LEAPER, F.C.S.,

*Instructor in Photography, City of Dublin Technical Schools.*

### CHAPTER II.

#### THE GRINDING OF A LENS.

To effect this, the edges of the flat surface of the glass disc, as supplied by the manufacturer, are gradually ground down by pressing the disc against an iron tool having a radius of curvature equal to the lens, both surfaces being supplied with emery and water; and the glass having been thus brought to the requisite form, is finally polished as highly as possible.

The plant required to carry out lens-grinding consists of a lathe, grinding patterns, emery, pitch, putty powder, and sheet brass.

Patterns in boxwood are first turned to the approximate curve of each surface, a pair being made for each side of the lens, viz., a concave or hollowed-out pattern and a convex or sphere-like pattern fitting into it. It follows from this that four patterns are required for each lens.

These patterns are next handed to the iron founder with instructions to make malleable iron castings of approximately the same form, and these rough castings are then brought to exactly the same curvative as the lens itself.

To carry this out, a piece of sheet brass is flattened, and the arc of a circle of the same radius as that of one surface of the lens is traced on it. The brass is then very carefully cut along the line, and the two patterns so obtained are worked into one another with emery and water until they exactly fit. The hollow or concave iron casting having been chucked in the lathe, the depression is smoothed out in the usual way, the convex brass pattern being applied to it from time to time to see if the work is progressing satisfactorily. The convex iron casting is then similarly treated, the concave brass pattern being employed to test the correctness of the curve. Finally, the concave and convex castings are ground one into the other until they fit.

The emery employed in the preliminary grinding is what is known as "coarse forty hole," and after having been used, as will be described further on, the residue is put in a beaker with water, and stirred up. After settling for half a minute, the water carrying the finer particles in suspension is poured into another vessel, and after settling therein for one minute, the liquid is poured into a third vessel, in which it is permitted to settle for five minutes, the operation being repeated at intervals of ten, twenty, and sixty minutes. By this means emery of seven grades of fineness will be obtained and of much more uniform quality than that procurable commercially.

To grind the patterns into each other, one of them is screwed to a flange fixed to a post about 3 ft. 6 in. high, and a little of "forty hole" emery spread over it with the fingers. The other pattern is then worked over it, the working being always spirally towards the edge so as to carry away any grit or dirt.

The patterns are then cleaned out, and the working repeated with successive grades of emery until the patterns are quite bright and an accurate fit.

The patterns should be a little larger than the lens to be ground, otherwise the surface of the margins of the lens would not be spherical.

The patterns being ready, a circle half an inch larger than the lens is to be cut from the glass disc, and one side of this disc having been attached with a little melted pitch to a stout brass plate, the other side is worked circularly with coarse emery over the pattern until it approximately fits it.

To do this the disc fixed to its plate is taken in the right hand, and moved about in the patterns six times in a circle and two or three times in different directions. Great care must be taken in doing this not to use undue pressure, never to go beyond the edge of the pattern, and to keep the emery damp.

When the glass touches all points on the surface of the pattern, the emery is changed for finer and finer kinds, and the smoothing continued until all lines and markings have disappeared.

As the shape of the pattern is changed somewhat by the grinding, it is necessary from time to time to bring it back to its original form by applying the pattern of opposite curvature to it and grinding the two together.

To see if the lens is fit for polishing, the surface must be very carefully examined with a magnifier, and if any scratches are noticed the entire operation must be repeated.

Assuming that one side of the lens is ready for polishing, the disc is detached from the brass support and another piece of brass turned in the lathe to approximately the curve of the face just finished. In this the curved face is cemented with melted pitch, and the series of operations repeated for the other face, using another tool corresponding to the second radius of curvature.

To polish the lens, a piece of very fine woollen cloth, three-quarters of the diameter of the lens, and the length of the pattern, is cemented to the latter with a very little pitch dissolved in turpentine. Some very fine putty powder is moistened and rubbed into the cloth, and the lens, held very firmly and quite flat, is moved to and fro over this, giving the lens at the same time a movement of rotation after each stroke. By repeating this operation for from two to six hours, the opalescent appearance left by the emery will gradually disappear. When finished, the surface should be quite smooth, free from scratches, and reflect light brilliantly.

The final operation consists in centering. To do this, a hollowed-out piece of wood is chucked in the lathe, and the lens fixed to it with a layer of pitch, both surfaces being slightly warmed to cause them to adhere. A candle flame is then placed at about three feet in front of the lens, on looking at which two images of the candle flame, one erect and the other inverted, will be seen. If on slowly rotating the lens these images remain stationary, then the lens is centrally placed with reference to the axis of rotation of the lathe; if they move up and down, the lens is not centered. In the latter case the lens is moved in the soft pitch until the desired result is attained. When this is done, very cold water is poured over the pitch to harden it, and the edges of the lens are cut down so that the axis of revolution of the lathe is the centre of the circumference of the lens.

To effect this, a piece of wood capable of up and down motion is fixed in the slide rest, the upper edge of the wood being faced with copper. This edge is then brought in position beneath the lens, and gradually raised until it touches the margin. The lens being meanwhile caused to revolve, and both surfaces being supplied with emery and water, the circumference will be gradually ground down, and when this has taken place evenly all round, the operation is complete.

Generally speaking, a pair of lenses are cemented together with Canada balsam. To do this, the concave surface of one of the lenses is gently heated, and a little balsam put upon it. The convex and corresponding surface of the other lens, having also been slightly warmed, is then pressed in contact so as to squeeze out the excess of balsam, the two surfaces being meanwhile moved over each other so that their axes coincide.

The final mounting in a brass tube does not call for any detailed description.

## Studies in Art for Photographers.

BY REV. F. C. LAMBERT, M.A.

### CHAPTER I.

A VERY slight knowledge of any language soon leads us to the conclusion that what at first seems nothing better than a hopeless confusion is capable of being considerably simplified as soon as a few general principles are observed. And, although these rules of syntax, etc., are observed again and again to vary, yet the variations are either very slight or are attributable to some systematic disturbing element.

It is only in comparatively recent years that any serious attempt has been made to discover and formulate a logical basis for the grammatical rules and forms of language.

Up to the present time I have failed to find any work which attempts to find a logical, scientific, or any sort of explanation as to why certain forms, arrangements of masses, grouping of colours, etc., give us satisfactory sensations, and why others are not so agreeable.

Whether this has been done I know not, but there is no reason why it should not be attempted. Possibly at this very early stage of our art studies, any further enquiry in this direction would fail to interest. But I will ask my readers to bear in mind from the first this one idea, viz., if so many different workers in art, in the majority of cases quite unknown to and independent of each other, have usually selected from nature similar arrangements of parts, disposition of mass, etc., in preference to any other, or in preference to "taking things as they come," it cannot be unreasonable for us to suppose that there must be a reason of some sort for this similarity.

Before we enter upon any detailed reference to the grammar rules of art language, it will be as well that we come to some general agreement as to what we mean by such words as laws, rules, etc., when we are free to choose for ourselves. Once again we may refer to spoken language. I make no secret of my entire ignorance of, say, the Hottentot language. But I will make bold to guess that those who have studied that (or any other spoken) language will tell me that the native Hottentot, quite unconsciously to himself, follows certain general arrangements of the parts of his sentence, that his fellow men use the same arrangement, and that experience shows that any great divergence from this general arrangement detracts from rather than adds to the force and vigour of what he has to say. In some such sense artists, quite apart from any imitation, find themselves best able to express their pictorial ideas by following certain general methods of selection, and arrangements of parts. We are pleased to apply the term rule, law, or canon of art to express the general custom of those who are best able to express their thoughts to us by means of their craft.

A poet or a musician will now and again boldly fashion a new sequence of words, or strike a strange chord of sounds, when the exigencies of the case require some such exceptional treatment—but unless it be done for a purpose of sufficient importance to justify divergence from the accepted usage, his compeers will be more disposed to accredit him with eccentricity rather than ability.

Another matter must be also kept in mind during the course of our joint studies, viz., that although we may be speaking of this or that rule or method being used, by no means must it be concluded that the worker sets himself the task of doing this or that according to rule. Rather may we say that, having regard to the work in hand, he found that he could best treat his subject in such and such a way, and it is *we* who observe that he saw fit to use a method similar to some other worker. This is not a

difference without a distinction. On the contrary, it is a point worthy of careful notice, and for this reason, viz., that if we set about making a picture as we would a pudding—*i.e.*, by following a certain recipe or code of rules—we may perhaps succeed fairly well with the pudding, but I have serious doubt as to the success of the picture. In speaking or writing we do not say to ourselves "remember the rule of relative pronouns! forget not the verb and its subject!" but, following rather the pleasanter course of reading our best writers and thinking their thoughts, we presently learn to find utterance of our thoughts in the sentences and phrases unconsciously snatched from those whose word painting clings to the eye or the ear.

So precisely may we, by studying the best works of the best workers, gradually find ourselves using ways and methods which the experience of our elders has tried and approved.

The object of these hints is not to create or set out this or that code of rules, and then say to the photographer, "Here is a recipe, follow it, and art is yours," but rather to say that fairly intelligent examination of those pictures, which most men agree in pronouncing noteworthy, shows certain methods and arrangements more or less common to all the workers. These methods have, at any rate, something like a consensus of opinion and practice to support them. Therefore until we can find more direct or more powerful ways of expressing our thoughts we shall be unwise to ignore the results of collective experience. It is not a wise proceeding to kick over the ladder until we are safely landed at the top, or, at any rate, have found something as good or better to hold on to.

It has been argued again and again that rules of art, study of composition, etc., are each and all quite unnecessary, conventional. Once again we will drag in our language simile (which by this time is almost worn to a skeleton with much rough usage). If a man is to make himself "understood of the people" he must be so far conventional as to use words known to his hearers, and to arrange them in sentences somewhat after the manner of his countrymen. It is in no way forgotten or ignored that true art is founded on nature, nor must it be forgotten at any time that true art is not simply repeated nature. Selection and arrangement are the very breath of graphic art, as ideas are the soul of all language, be it language, of words, of music, painting, sculpture, or the drama. Sir Thomas Browne has said, "Nature is not at variance with art, nor art with nature. Art is the perfection of nature. Nature hath made one world and art another. In brief, all things are artificial, for nature is the art of God."

It is manifestly out of our province just now to take any account of the various *isms* of the day, beyond saying that wholesale reformers are seldom wholly in the right, although they may not be wholly in the wrong. But for the exponents of any *ism* to claim that the sum total of past experience is utterly wrong, and that their particular *ism* is the seed of perfection is on their part a cruel act, *i.e.*, placing us on the horns of a dilemma; for their first claim is too bad to be true, and the second is too good to be true.

Until we can have the second without the first we may more wisely follow in our fathers' footsteps—on the one hand, assuring ourselves that if we fail to see merit in those works which are honoured by the majority of sober men, the fault lies with us rather than these works; on the other hand, giving every dutiful attention to those whose appreciation of these works has gone hand in hand with a world's esteem.

Bulwer Lytton had no particular *ism* in view when he penned these words, "Art is the effort of man to express the ideas which Nature suggests to him of a power above

Nature, whether that power be within the recess of his own being or in the great First Cause of which Nature, like himself, is but the effect."

## Instantaneous Photography.

By W. JEROME HARRISON, F.G.S.

### CHAPTER XI.

THE SENSITIVE PLATE UPON WHICH THE IMAGE IS TO BE IMPRESSED BY LIGHT.

#### II.—THE SUBSTANCE SENSITIVE TO LIGHT.

*Influence of Light upon Matter.*—It is probable that every kind of matter is more or less affected by light; but upon most substances the action of this physical force is so slow, or concealed, that we do not notice any change, or if a change be noticed, it is not assigned to its true cause.

When a lady returns from "a run on the beach" in June sunshine, with a bronzed skin and faded ribbons, she assigns these phenomena rightly enough to the vigorous radiations from the solar orb, which have added colour to her epidermis and subtracted it from the aniline dye in the silk; but the photographer who grumbles that the plate-maker is "sending plates of only half the rapidity I had from him formerly," is often slow to recognise the fact that it is to a chemical change (produced by sunlight) in the glass forming the roof of his studio, that the longer exposures he has been forced to give are due. Attention was forcibly drawn to this matter by Mr. Gaffield more than twenty years ago, when he pointed out that the oxide of manganese which is commonly used to correct the green colour of ordinary glass, itself becomes pink under the long-continued action of light. Almost any sheet of window-glass which is removed after long use will show, when carefully examined, a decided coloration, as compared with the margins, which have been protected from light by the rabbet. Sometimes the action of light is to *print* a distinct copy of any picture long exposed in contact with glass, upon the vitreous material. We once saw a remarkable example of this kind exhibited by Mr. George Mason, of Glasgow.

As early as the commencement of the Christian era, we find Pliny stating the fact that yellow wax was bleached by the action of light; and both Greeks and Romans knew well that certain precious stones, and almost all paintings, suffered change by long-exposure to sunlight.

#### *Both Physical and Chemical Changes Produced by Light.*

—Some of the effects produced by light upon matter are of a purely physical nature; the substance suffering change in certain of its properties, but remaining of the same chemical composition. Thus ordinary yellow phosphorus turns red in sunlight; sulphur dissolved in carbon bisulphide becomes insoluble, and settles on the sides of the bottle in which its solution has been exposed to light. These two elements undergo a physical change only.

But in most cases the light produces a *chemical* change in the matter upon which it acts. The ferric oxalate with which the paper used in the platinotype process is coated, loses some of its oxygen when exposed to light, and is reduced to ferrous oxalate; these two substances constituting the faint image which is seen when such paper is removed from the printing frame.

A mixture of hydrogen gas and chlorine gas explodes when exposed to sunlight, the result being the formation of the compound gas called hydrochloric acid.

In every large laboratory there is a special "dark cupboard" reserved for substances—such as certain compounds

of mercury, copper, chromium, lead, etc.—which are well known to be affected and changed by exposure to light.

*Certain Silver Compounds most Sensitive to Light.*—For our special purpose—the securing of photographs in the fraction of a second—we must find substances which are not merely affected by light, but which are acted on by it "instantaneously."

For this purpose all research has shown that certain compounds of the metal silver with the three non-metallic elements, chlorine, iodine, and bromine (called collectively the *halogens*) far surpass every other known substance.

*Silver Nitrate* (commonly called *lunar caustic* by surgeons) is a compound of silver, nitrogen, and oxygen; its chemical formula being  $\text{AgNO}_3$ . That famous alchemist, Albertus Magnus, who flourished in the thirteenth century, mentions that the skin turns black when rubbed with this substance. For certain diseases silver nitrate is or was the only remedy. But the skin of the unlucky patients who are obliged to imbibe this drug soon becomes discoloured—of a bluish-black tint—or it gets into the outer tissues of the body and is affected by light.

Readers of Wilkie Collins' powerful novel "Poor Miss Finch" will remember the great use he makes of this fact.

The very first experiments ever performed in photography were done by the aid of silver nitrate. Schulze used it in 1727, and Thomas Wedgwood about 1790 to 1800, in the way we have already described. But although silver nitrate blackens slowly when spread upon paper, or mixed with an organic substance, and exposed to light, it is not nearly sensitive enough for direct photographic processes. But as a means of producing other and more sensitive compounds of silver, the nitrate is invaluable, and tons of it are used every year by the plate-makers. The pure or *recrystallised* silver nitrate must be employed.

*Sensitiveness to Light of Silver Chloride.*—Every molecule of the white solid called chloride of silver contains two atoms, one of silver and one of chlorine; chemists, therefore, write its formula, shortly,  $\text{AgCl}$ .\* Masses of silver chloride occur as a mineral in certain rocks; and the substance in this state is known to miners as *horn-silver*, from its waxy, translucent appearances. Horn-silver is found in the Hartz mountains of Germany, and it appears that the miners of this district noticed that the lumps of horn-silver blackened or became discoloured on the outside when they were brought out of the dark mine into sunlight. The old German alchemist, Fabricius, recorded this fact about the year 1556.

Just two centuries later, an Italian—Professor Beccarius, of Turin—noted that silver chloride which had been produced artificially (as by the mixture of solutions of common salt and silver nitrate) was changed in hue from white to violet and brown, by exposure to the sun's rays.

In 1802 our great English chemist, Davy, remarked that paper, or leather, coated with silver chloride, was more sensitive to light than the same material coated with silver nitrate.

*Light, Unaided, cannot Act Photographically.*—Perfectly dry silver chloride placed in a glass tube from which the air has been removed is *wholly unaffected by light*. But if a drop of mercury be placed in the same tube, the silver chloride speedily darkens in sunlight. How is this? It means that light is not able, unassisted, to separate the two elements (the silver from the chlorine) of which the silver chloride is composed. But the mercury pulls or attracts the chlorine, and with its aid the light is able to effect the decomposition. We may, therefore, style the mercury a *sensitiser*, since it makes the silver salt sensitive to light.

\* *Argentum* is the Latin name for silver, whence  $\text{Ag}$  = Silver.

Under ordinary conditions the moisture always present, and the paper, etc., upon which the silver salts are spread, act as weak sensitizers, and enable light to effect a decomposition or separation of the metal from the non-metal, altogether or in part.

*Talbot Discovers the Use of Silver Nitrate as a Sensitizer.*—Fifty years ago nothing was, of course, known as to this need for the presence of a "sensitizer." But, somewhere about the year 1837, Henry Fox Talbot found that by having a *slight excess* of silver nitrate upon a sheet of paper coated with silver chloride, the sensitiveness of the latter substance to light was increased a hundred-fold.

(To be continued.)

## Photographic References.

BY MAJOR J. FORTUNÉ NOTT.

### FOCUSSING.

(Continued from page 28.)

ATTENTION has already been drawn to the fact that every camera intended for all-round work should be so constructed that the back frame can be given a vertical swing. This is a most important movement in focussing, and in a somewhat lesser degree so is the movement known as the horizontal swing, for it is one to which frequent resort has to be made by skilled photographers. But better advice we consider cannot be given to any one who is only just mastering the rudimentary details of photographic manipulation than to recommend him to work without resorting to the use of these movements, and at first to confine himself to focussing as well as he can with the back fixed in its ordinary place, taking care, of course, to see that it is in the correct vertical position that will keep all lines in natural perspective.

There are, however, frequent occasions when the vertical swing must be used, especially when photographs of architectural subjects are required, for in order to get in elevated parts of the buildings, it becomes necessary now and again to give the camera a slight upward tilt which it can at once be seen causes the perpendicular lines to converge. Now, by a judicious movement of the back the ground-glass screen can be brought into a position wherein the convergence produced by the tilt given to the camera is entirely overcome. Or, again, in portraiture or in outdoor work where any object in the near foreground slopes towards or away from the camera, so that its various parts are not equally distant from the ground-glass screen, and therefore cannot be brought under ordinary conditions into the same focus. While reliance should be placed wherever possible upon the stops to overcome as far as it is desirable this awkward difficulty in focussing, nevertheless resort may be necessary to the conveniences of the swing-back, and it therefore behoves the photographer to thoroughly understand its manipulation and the effects produced by its movement.

Its use can easily be discovered by giving the subject some careful thought. As the rays of light from all objects in the field of view must be of equal length to be in identically the same focus, it follows when they are not in the same plane, and a sharp definition is required, that by a proportionately equivalent swing being given the ground-glass screen when its central part is in correct focus—so that the portion reflecting the image of the nearest object is slightly removed and the opposite part whereon the image is represented of the most distant part of the building or sitter is brought nearer—an equalisation of the length of rays at the

extreme points to those impinging on the plate from the central points is accomplished. This rule, it can be seen, applies equally to cases wherein this approaching or receding of the planes of the picture result from the tilting of the camera and in this way destroying the parallel that should exist between the object, say a building and the ground-glass screen.

The rules governing these movements apply almost equally to both the horizontal and the vertical swing, for the one is applicable to cases in which the upright lines of the picture are not in correct parallelism with the axis of the lens, and the other where the horizontal lines approach or recede in too sharp a manner for any correct focus to be obtained without the aid of a corresponding swing being given to the focussing screen.

It has already been pointed out that the swing in the back of a camera should be from the centre, the construction giving a somewhat similar movement in one direction to that to be seen in an ordinary toilet mirror. When this is not provided for, the correct adjustment can only be made in a tentative way, inasmuch as the centre of the plate where the focussing point is situated is affected when the back is swung in either direction, and in order to obtain the correct adjustment a series of experimental movements have to be made, as no correct point exists for comparison. In very few forms of portable cameras made in England can these movements of the swing-back be performed in the most perfectly satisfactory manner. They should be as easily controlled as the focussing adjustments of the lens, and in the perfect camera of the future this will be provided for.

In some forms of camera a movement is provided whereby the front part holding the lens can be given a vertical swing. This is very rarely necessary, but may now and again be used by a very skilled operator. By its use the front can be moved into a parallel position with the back after it has been swung, with a similar result to that produced by an extended rising of the front.

It must not be forgotten when the employment of the swing-back is considered desirable, in order to bring different planes of the picture into focus, that a small stop introduced into the lens will frequently accomplish the desired result, and this method of doing the work when the increased exposure it necessitates is possible, is the one that should always be preferred. The other method, a very few experiments can soon demonstrate, produces distortion, owing to the shortening or lengthening of the oblique lines. The perspective is falsified and the whole scene is given that defect artists recognise as being out of drawing. This defect in some instances can totally destroy the value of an otherwise perfect photograph, for, instead of conveying an idea or impression of truth, the scene is converted into a caricature. The peculiar effect an excessive amount of swing can create becomes painfully apparent if a close view of an animal, say a horse or a cow, is taken from a position in which the animal is almost facing the camera, and the swing is used to bring the tail and the head into focus. The distorted picture resulting from this method of procedure can have but one useful feature about it, the practical object lesson to be gained from its careful scrutiny.

In concluding this part of the subject we wish to draw attention to the following features in connection with this important matter of focussing. It is often better to get the principal objects in the picture smaller than desired if the use of the swing-back, or other dodges to procure correct definition, can in this way be obviated, and to trust to a subsequent process, known as enlarging, to give size to the picture. It is, therefore, better to work the lens at its focal distance whenever possible, and if lenses of different focal

lengths are procured, this method of procedure can easily be adopted, for the lens can be suited to the scene. The following table gives the distances at which all objects are in their best focus when the optical centre of the lens is fixed at its correct focal position with respect to the ground-glass screen :—

Focal Length of Lens.	Distance at which Objects become in Focus.		
6	..	..	90 ft. 6 in.
7	..	..	140 " 7 "
8	..	..	160 " 8 "
9	..	..	180 " 9 "
10	..	..	200 " 10 "
11	..	..	220 " 11 "
12	..	..	241 " "
13	..	..	326 " 1 "
14	..	..	351 " 2 "
15	..	..	376 " 3 "
16	..	..	402 " "

These measurements have been calculated from the "Tables of Conjugate Foci," by Mr. J. R. Gotz, and are made for lenses working with full apertures; of course, by the use of stops different planes of the picture can be brought into an equally effective focus as those in the central parts of the field of view when seen with the open lens.

(To be continued.)

## The Stereoscope.—XVI.

BY VALENTINE BLANCHARD.

THE Graphoscope is an instrument tolerably well known, and is much more frequently seen than the ordinary stereoscope. The reason for this is not very far to seek. It serves a two-fold purpose. It is a compact little easel for the exhibition of photographs of moderate size, and is furnished with a large magnifying lens; but it is a stereoscope as well, as will be seen by an examination of fig. 15. When used as a stereoscope, the large lens, which is arranged to readily slide up and down the two brass rods which support it, is neatly folded away underneath. The diagram shows the instrument arranged as a stereoscope, but a close inspection will reveal the rods hinged at their base, and carrying the large lens which is snugly stowed away below the base-board.

The Graphoscope, unfortunately, is very rarely seen as shown in the illustration. The demand for the stereoscopic portion is so slight that it is generally folded down out of the way, and the brass rods, with their burden, are uppermost, and a cabinet portrait of some pet celebrity is usually in position on the easel ready to be looked at.

In view of the probable demands on the stereoscopic portions of the instrument, which the rapidly-increasing revival of the stereoscope is likely to bring about, I have thought it expedient to make a drawing of the Graphoscope for ready reference, as without doubt only a few slight alterations in construction would make it readily available for viewing stereoscopic pictures much larger than those usually produced.

Let us now proceed to examine the improvements really needed. To begin with, the hood to the eye-piece, as shown on the Holmes stereoscôpe, in fig. 14, page 29, is an absolute necessity, for no stereoscope can be regarded as complete without this addition. Secondly, the eye-piece should be made to slide up and down, and would only need an arrangement of rods similar to that employed to carry the large magnifying glass, but could be hinged so as to fall down in front, and it would not then interfere at all with the rods that are made to fold underneath. This is quite

a slight matter of detail, and would give little or no extra trouble to the manufacturer. Thirdly, the easel, with its ledge to support the picture, should be made to slide up and down at will; and, of course, the frame carrying the ground glass should be considerably increased in size so as to make it available for transparencies of much larger proportions than those of the present regulation dimensions.

Reference has already been made to a modern French stereoscope of gigantic proportions, but on the general lines of the American stereoscope so frequently referred to. This instrument was shown by Mr. W. England at one of the technical meetings of the Photographic Society, and attracted considerable attention, both for its peculiar construction and the unusually large photographs shown in it. Some of the pictures were larger than whole-plate; indeed, one slide, a full-length portrait, was not less than ten inches high, though the width was not probably greater than six inches. Still, owing to the length of the focus, they appeared very slightly enlarged. The general opinion

FIG. 15.

expressed at the meeting was that, as the pictures were so slightly magnified, there was no inducement to adopt such a clumsy instrument. There was, however, one clear gain which specially struck me. The defects due to the grain of the paper, or blemishes in the negative, and, more than all, the patent results of over retouching, were so reduced in importance as to be scarcely visible. With short-focus eye-pieces the defects of every kind are painfully apparent. I felt, therefore, the new instrument had at least one distinct advantage over the old-fashioned instruments. Being specially struck with this fact, I determined to make a more careful inspection of the leviathan stereoscope, as it may fairly be called. An opportunity has recently been furnished me through the kindness of Mr. England, and I am now able to give a more complete description of the instrument. There are several points of great novelty about it, and, as the ideal stereoscope is probably in the womb of the future, some amateur mechanic who may read these lines may get an idea from the French instrument to help him on in his efforts to make the perfect one so much desired.

The shape most certainly cannot be recommended, for though it somewhat resembles the American stereoscope on the stand, as shown in fig. 14, still, imagine a machine more than two feet long resting on a slender stand! It looks much more like some deadly instrument of destruction—a Gatling gun, or a new-fashioned mitrailleuse—than such an instrument of peace as the stereoscope. The good points,

however, could easily be incorporated with the best portions of the Graphoscope, and, therefore, it is needless to dwell further upon the form, and to deal instead with those portions worthy more serious consideration.

The eye-piece is distinctly novel. It is made of semi-lenses two inches square, so that the original disc could not have been less than five inches in diameter. The great point of novelty, however, is contained in the fact that there are two sets of semi-lenses, one above the other, making four prisms in all. With the single set the focus is considerably over eighteen inches. The second pair are neatly framed, and made to fit very exactly over the others, and are held in their groove by small buttons. The combination produces a focus of about twelve inches. Only a very dull light was available when I examined the pictures through both single and double prisms, but I saw no trace of a chromatic edge to the outlines anywhere. The arrangement for focussing is very ingenious. The cross-bar which carries the picture is attached to an endless chain, which works in a groove cut in the long bar proceeding from the eye-piece, and is held in position by two spiked wheels, one at each end of the instrument. The wheel nearest the eye-piece has a milled head, in the turning of which the cross-piece is smoothly dragged up and down at will. The spikes fit into the links of the chain, and no effort is required in racking the picture forward or backward. Indeed, there is no jerkiness whatever, and this is more than can be said of most of the American instruments.

A stereoscope of such extensive range is rarely needed, and is not likely, therefore, to be very popular, but, on the other hand, instruments of short focus, besides magnifying every little defect in the picture, undoubtedly tire the eyes much sooner than those of longer focus, and at the same time limit the amount of separation between the pictures. For instance, with a stereoscope under six inches in focus it is difficult to increase the distance between the objects in the two pictures beyond  $3\frac{1}{4}$  inches, whereas with one of eight inches they may be separated to a distance of  $4\frac{1}{4}$  inches without any trouble whatever. I am at present busy with experiments on both whole and semi lenses of various focal lengths, and hope to give the results in the next chapter.

*(To be continued.)*

## Round and about the Clubs.

### THE WEST LONDON PHOTOGRAPHIC SOCIETY.

WHEN one, on either pleasure or duty intent, visits an exhibition of the work of the members of any society, he is prepared, and generally expects, to find the walls covered with "pictures" of varying beauty, with a fair sprinkling of those which may reasonably be described as mediocre. It is only natural to expect that, amongst a large and promiscuous collection of amateur workers in the photographic art, a proportion, greater or less, will be found of those who have not yet become adepts in working or selection, or who will never become so, on the principle that artists, like poets, are born, not made. On these grounds it came as a pleasant surprise to find at a society's exhibition that the great majority of pictures, from the points of view both of selection and treatment, and that few, very few, are of such a character as to be passed over without a second examination.

We must, therefore, congratulate the members of the West London Photographic Society upon the high average of the pictures hung upon the walls of their new premises—the Lecture Hall, Broadway, Hammersmith—at the exhibition recently held. There were several points to be remarked with respect to the exhibition as a whole; the first, and perhaps the most striking, being the almost entire absence of albumenised silver prints; another was the comparatively large number of prints upon home-sensitised paper; another, the taste shown in

mounting and framing the pictures; and yet another, the great fascination which cloud-studies seem to have exercised on many of the exhibitors.

The number of pictures hung was considerable, and it is impossible to do more within the limited space at our disposal than notice a few of them, prefacing our remarks by a statement of the fact that in the competition for which the prints were entered, there was no classification, and that the judges—Messrs. Gale, Wellington, and L. Clark—were at liberty to award medals to such of the pictures as they considered deserving. The first picture we have to notice is a half-plate platinum print, "Hoar Frost," by Mr. J. J. Adams, which was a clever treatment of a somewhat difficult subject. Mr. Chang showed a nice little picture, "The Mansion," which was somewhat poetical, for, to use an hibernicism, all you could see of the mansion was the lodge at the entrance gates. Mr. L. C. Bennett took a bronze medal for a platinum print, "A Nocturne," showing a ship, with a moon just peeping out of dark clouds behind it. He also showed three clever little river and cloud studies—"Below London Bridge;" "After the Storm," another cloud effect; a charming little view, "At Brentford." Mr. J. M. Dickens exhibited three portrait enlargements, which, however, looked suspiciously like enlargements from copies of good cabinet portraits. Mr. G. F. Blackmore's "Work for Daylight Flies" is evidence that he is a disciple of the naturalistic school, whose followers, by the way, do not seem to be very numerous in West London. "Seeking the Shade," by the same gentleman, is a charming little picture—a bit of river with trees on the banks, with cattle standing together in their shade. Mr. Blackmore takes a bronze medal for "Where Duty Calls," which may be described as a somewhat peculiar picture; there is a beach with cliffs at the back, the tide is out, and a boat lies left high and dry by the tide, and men are walking down to it. We devoted some considerable time to the study of this picture, but have not yet been able to decide what it all means. Mr. S. E. Kellow has two pretty little quarter-plate platinum prints of Charlton and Frognall. Mr. T. S. Hazeon and Mr. W. S. Rogers have artistic ideas of very much the same calibre, for both of them send in the same study—three old trees growing together on the bank of a stream, the latter gentleman giving his picture the title of "Companions." The picture, however, is a very pretty one. Mr. Hazeon sends in two flash-light pictures of scenes in a Greek play, which he calls "A Sicilian Idyll," but we cannot congratulate him upon his success with the flash-light. The Hon. Sec., Mr. J. A. Hodges, gets a bronze medal for a platinum print, untitled, giving a river scene, with a cottage on the left; but we think even that is surpassed by a view, "Near Brendon," in which the varying distances, in one of the most charming bits of river scenery we have seen for some time, is admirably rendered. It is a curious coincidence that Dr. J. Harrison Low also shows the same picture.

Mr. Lawley selected the Lake District and Dove-dale as the scene of his labours, with very pleasing results—"The Lion Rock, Dove-dale," particularly good, as was also "Evening Shadows." Mr. W. H. Whittier exercised careful judgment in the selection of his view of "Osterley Park," and Mr. R. Whiting's flower studies—"Lilac Bloom" and "Cherry Blossom"—were all that could be desired. Mr. J. G. England is a careful worker, and gives evidence of considerable taste in his views of a "Canal, near Heston," and "Near Weybridge." Mr. C. Winter takes a bronze medal, and deservedly, for "A Winter Scene"—a curious fact, which is more of a picture than most amateur attempts at such subjects. Mr. H. Selby's little platinum print, "The Distant Sea," which takes a bronze medal, is admirable. The observer stands on a hill top and looks across fields covered with sheaves of corn to the sea in the distance, and the clouds are well in keeping with the subject and choice of view. Mr. J. Wilson, the Hon. Librarian, shows a print on home-sensitised paper for a pinhole negative, "Towing Path, Kew." The result is certainly pinholey.

The silver medal offered by the President for the best picture in the Exhibition was awarded to Mr. C. Whiting for a 15 by 12 print on home-sensitised paper of the "Crypt, Canterbury Cathedral." This point is one of the finest specimens of architectural work we have seen for some time; the exposure and development are all that could be desired, and the printing and toning are admirably suited to the subject. We should much like to know, however, on what grounds the judges awarded it the special medal for the best "picture" in the Exhibition. There is a general impression that composition, or at any rate selection, are

necessary in the formation of a picture, and if that be so, there are certainly several other exhibits which are more in the nature of pictures, cases, we mean in which great care and judgment had to be exercised in the selection of the point of view, and in which a slight variation in the spot chosen would have taken the print out of the rank of pictures and relegated it to that of non-descripts. It is to be regretted that the judges did not by their award mark their sense of the value, the enormous value, of the exercise of artistic taste in photographic productions. Mr. Winter's view of "Bodmin Castle, Sussex," was excellent, but the colour, almost brick-red, spoilt it.

As usual there was a photographic joke at the Exhibition, and it was due to Dr. Low, who produced a platinum print, which consisted of a river view, with the banks and hills in the background in complete darkness, very black clouds above with just a small white rift in the centre, "What we are Coming To." It was understood to be to some extent a caricature of a picture which took a medal some time ago at a great exhibition. Dr. Low took a bronze medal with another platinum print of a charming river and cloud study, "Black or Silver," which is deserving of high praise. "In the Summer Sheen" was another pretty study by the same gentleman.

On the Saturday evening there was an examination of lantern slides sent in for a members' competition, the prizes to be given for the two best pictures. The first prize was secured by Mr. J. E. Kellow, and the second by Mr. J. A. Hodges. There was a good number of visitors, for whom tea, coffee, and cakes were provided, and the Exhibition may be pronounced a decided success. We shall look forward with much pleasure to visiting Hammersmith again on the occasion of another Exhibition.

## Notes from the Edinburgh Centre.

(By our District Editor.)

THE monthly meeting of the Edinburgh Photographic Society was held in Dowell's Rooms, 18, George Street, on the evening of Wednesday, the 14th inst. There was a large attendance, over which the President, Mr. H. J. Blanc, presided. Professor James Hunter, Edinburgh, gave an address on "The Spectrum," with illustrations, the most interesting of which consisted in showing the quality of red glass. One specimen allowed none but the red rays to pass, while another, which was equally red in appearance, allowed a considerable percentage of blue rays to pass, and would, therefore, have been dangerous for a photographer to make use of in the dark-room. Mr. Hunter's explanations were very clear, and his remarks so interesting that the members were unaware of the flight of time, and before he concluded, the time for closing the meeting had arrived. The discussion upon the subject was consequently postponed till the next meeting. A beautiful presentation print of "Tissington Spire, Dovedale," by Mr. R. Keene, of Derby, one of the prize pictures in Class I. in the Exhibition, was on view. The prints were in photo-etching, by Mr. James C. H. Balmain, Edinburgh.

An endeavour is being made to get Mr. Gambier Bolton to favour the Society with an evening during the present session.

Dr. Emerson recently sent a copy of his latest work, "Wild Life on a Tidal Wave," to the Edinburgh Photographic Society, and it is stated that he intends to forward a copy of each of his other works. The Society possesses a few works, and would gladly form them into a library; but, unfortunately, it has not yet been able to secure independent premises. It was hoped there would be a surplus from the exhibition, which would have been handy for some such purpose as the providing of rooms. All such hopes have, however, been dispelled by the financial results of the exhibition.

How it was possible for professional photographers to fulfil their orders, or for amateurs to follow their pastime during the month of December, passes my comprehension, when the quality of the light is considered. There were only seven hours of sunshine out of a possible of 212 in the whole month. On twenty-five days there was no sunshine at all, and on only two days was there more than one hour. One of these days was the 1st, when there were four and half hours, and the other two and a half hours were distributed over the remaining thirty days. Since January came in, the light has greatly improved.

The Faculty of Advocates in Edinburgh, which possesses the finest library in Scotland, has subscribed, in the language of the

report of the curators, published this week, "for an elaborate work entitled 'Animal Locomotion,' which comprises 781 plates, containing more than 20,000 figures of men, women, and children, animals, and birds actively engaged in walking, flying, and other actions which illustrate motion or the play of muscles. The investigation of which this great work is the result was undertaken under the auspices of the University of Pennsylvania by Mr. Eadward Muybridge. It is a work of invaluable service to the art connoisseur, the scientist, the artist, and the student of nature."

If, as stated above, there was difficulty in silver printing in December, on account of the want of sunlight, bromide printing is now, it would appear, having its turn of difficulty, on account of a defect in the gas supply. In consequence of the strike among railway servants, it has been found necessary to reduce the pressure of gas in the city of Edinburgh, in order that less may be consumed, as coal is scarce, and in the *Scotsman* for last Saturday a letter appeared from a firm of photographers complaining that the diminished light had had the effect of spoiling bromide prints which they were producing.

## Exhibitions.

### VENTNOR PHOTOGRAPHIC EXHIBITION.

THE efforts of the Committee who promoted the exhibition at Ventnor have resulted in a very capital collection of photographs. Nearly 300 exhibits are shown. These have all been well arranged in the hall of the Ventnor and Bonchurch Literary and Scientific Institution. The awards made by the judges (Messrs. T. M. Brownrigg, John Fielder, and Dr. Lord) are as follows:—

Class A (series of three portraits). Silver medal, Messrs. Window and Grove, for four well executed portraits in carbon. Bronze medal, W. J. Byrne, for portraits, two, "Joy and Sorrow," attracting considerable attention.

Class B (series of three landscapes). Prizes, *Photographic Reporter* medals. Silver medal, J. P. Gibson, for "A North Country Road," "The Ford," and "Far from the Madding Crowd," all very beautiful examples of Mr. Gibson's admirable work in platinum. Bronze medal, A. Hendrey, for a series of very clever photographs, "A Day in the Fog."

Class C (series of three seascapes). In this class the silver medal is not awarded, the bronze medal going to G. West and Sons, for "Outward Bound; the *Yarana* and the *Melissa*."

Class D (series of three transparencies). C. V. Shadbolt takes the silver medal for six views in the Holy Land, and W. D. Welford the bronze medal for "The Haven of Rest," "Torbay Regatta," and "Harvest Time." There were only three competitors in this class, so that the judges had not much difficulty of selection.

Class E. (series of six stereoscope slides). In this class no awards were made, although there were three entries, and the pictures were of very fair quality.

Class F. (series of six lantern slides). The silver medal was awarded to G. West and Sons for six "yacht racing scenes," and the bronze medal to John Carpenter, for "Flower Studies." Other good slides were exhibited by P. H. Fincham, "Views in the Engadine;" James Dore, "Ships," "Winter," "Cloud Studies," etc.; J. E. Austin, W. D. Welford, C. V. Shadbolt, Edgar G. Lee, and others.

Class G. (enlargements). Silver medal, G. West and Sons, the yacht *Mohawk*. Bronze medal, Stanley Hurst, "Portrait of a Child." Enlargements were also entered by J. P. Gibson, "The Wood Waggon;" Herbert Lea's "Dorothy;" W. Nicholson, "Shanklin Chine," etc., etc.

All the above classes were by the conditions open to professionals or amateurs, with the result that the professionals have secured the bulk of the medals, one firm taking three prizes.

The following classes were open only to amateur photographers:

Class H. (series of three portraits). Silver medal, Shapoor N. Bhedwar, very fine pictures, and well meriting the award. Bronze medal, Alfred Stieglitz, three good portraits, "Marina," "Professor Vogel," and "Ernesto."

Class I. (series of three landscapes). Silver medal, H. Everitt. Bronze medal, Karl Greger, "Arundel Castle," "Ebb-tide," and "Amberley Castle."

Class K. (series of three landscapes). Silver medal, A. R.

Dresser, "A Rough Day," "A Storm," and "On the Zuyder Zee." The two first are old favourites, and are approved and applauded wherever they are shown. The bronze medal was awarded to J. E. Austin for "Off to the Boats," "In the Harbour," and "Setting Sail."

Class L (genre or figure study). In this class S. N. Bhedwar takes the silver medal for "Her First Offer," "Granny's Comforts," and "A Reverie," J. E. Austin being awarded a bronze medal for "Entangled," "Left by the Tide," and "The Gentle Craft."

Class M (enlargements). A. R. Dresser wins the silver medal for "Cooling Waters," and J. W. Evans the bronze medal for "Tettenhall Wood."

Class N (architecture). The silver medal is awarded to E. Court Cole for three excellent prints by Blanchard's platinum process, Dr. T. H. Morton securing the bronze medal with views of Lincoln and Durham Cathedral.

Class O (instantaneous, animals, AMATEUR PHOTOGRAPHER medals). Silver, Carl Greger, very good photographs, on Ober-netter paper; bronze, J. Catto, for three clever studies of dogs, taken in Victoria, Australia.

Class P (ladies' work). The first prize, a water-colour drawing, was awarded to Mrs. S. Frances Clarke for "Queen of Hearts," and the second prize; a bronze medal, to Miss Ada Scott for nine landscape photographs, which show considerable promise; another bronze medal was given to Miss S. Ballard for her exhibits, "Contemplation" and "The Milkmaid."

Class Q (prizes were offered for work done by *bona fide* residents in the Isle of Wight). H. Everitt took both prizes, the first a camera and kit, given by Colonel Malden, and the second, an oil painting, by Mrs. Cole Norman.

Class R (series of views of the island). Miss Ada Scott took the first prize, and W. D. Groundsell the second.

We are not intending to find fault, but the Committee have been very lavish in their prizes. We have no doubt that those who have secured prizes will be delighted with the verdict of the judges, and those who are left out in the cold must hope for better things. In all photographic exhibitions there are far too many classes. Thirty-six prizes were offered, 33 awarded, and there were in all 64 exhibitors.

We are sure that the exhibition will be appreciated at Ventnor. The Committee have been unremitting in their zeal to make the exhibition a success, the bulk of the work falling to the lot of Col. Malden and the Hon. Secretary, Mr. W. Hoskin.

On the evening of Monday, the 19th, the first day of the Exhibition, Mr. Charles W. Hastings exhibited the AMATEUR PHOTOGRAPHER 1890 Prize Slides to a large and appreciative audience. The lantern was in charge of Mr. Nicholson. During the exhibition of the slides, Mr. Hastings gave a running comment upon them, and made many references to recent advances in photography.

On Wednesday evening Mr. T. M. Brownrigg showed a very interesting collection of slides made by himself from his own negatives; and to-night Mr. J. Dore, of Sandown, is to show a selection of his slides, entitled "British Subjects;" these will, we are sure, be much appreciated. The Exhibition closes on Saturday.

## Societies' Meetings.

**Birkenhead.**—The Association opened their year on the 15th inst. with a soirée and reception by the President (Mr. G. E. Thompson) and Miss E. Thompson, in the rooms of the Y.M.C.A., Grange Road. This was the first presidential reception the Association has enjoyed, and it was very successful, being largely attended, about 250 members and friends being present. On arrival at the Y.M.C.A., the whole of which building was thrown open, the guests were met and welcomed in the library by the President and Miss Thompson. The proceedings then opened with a select concert in the small lecture room, which was rather crowded. In the library an assortment of transparencies, taken by members of the Association, were exhibited. At the close of the first part of the musical programme the guests adjourned to the reading-room, where a supply of eatables were partaken of with tea or coffee. Limelight demonstrations were given concurrently, on account of the large number of guests, in the upper and lower room, and presided over respectively by Mr. G. A. Carruthers and Mr. A. F. Stanistreet.

**Bradford.**—The first monthly meeting for the new year was held on the 15th inst., when Mr. Walter Leach, F.C.S., a member, gave a paper on "The Diazotype Printing Process."

**Brechin.**—The usual monthly meeting was held in the Association Rooms on Tuesday, 13th inst., Mr. George Mackie, Vice-President, in the chair. The Secretary intimated that the Committee had arranged that assistance should be given to beginners on Tuesday evenings—Mr. Mackie, developing plates; Mr. Ross, lantern slides by contact; and Mr. Stewart, slides by reduction. Mr. Stewart then read a paper, "Through the Highlands with a Camera."

**Bury.**—The members of this newly-formed society met at the Temperance Hotel on the 6th inst., under the chairmanship of their President (Mr. J. R. Thompson), when Mr. J. T. Pentney read a highly interesting and instructive paper, entitled "A Glimpse at Photography."

**Cambridge.**—On the 7th inst. the first annual exhibition of photographic work in connection with the Club was opened in the rooms of the Cambridge University Photographic Society, No. 2, St. Mary's Passage. Two prizes were offered by Mr. C. S. Roe, and for these competition was fairly keen. The first prize, a silver cup, was awarded to Mr. F. H. Sanderson, for a matt-surface silver print, entitled, "Gossip." The picture is the result of a happy inspiration which seized the artist while in Northampton Street, Cambridge. An old gentleman, well-known to Cantabs, is seated outside the door of his house, talking to an old lady, who is dressed in very quaint style. The effect is wonderfully good. Mr. W. H. Hayles secured the second prize, a silver-mounted horn, with a bromide print on Eastman paper. The picture is a landscape, taken at Gomshall, Surrey. There was no third prize awarded, but Mr. S. H. Pryor was placed third in order of merit, with a village street scene at Stapleford, Cambs, which depicts a water-cart and figures. The exhibition was also open on the 8th inst., when there was a lantern demonstration.

**Cardiff.**—On the 9th inst. a numerous set of capital slides, depicting the city of Boston (U.S.) and its environs was put through the lantern. Most of the views were appreciated, not only by reason of their "sharpness" and general excellence, but because of the historical incidents and events narrated in the descriptive lecture read by Mr. Bedford. A good audience assembled at head-quarters on the 16th inst., to witness a lantern display by Messrs. Tom Evens and T. E. Heath. About 180 slides were passed through the lantern, depicting some of the choicest scenery in the neighbourhood of the Gower Coast, St. David's, Clovelly, Vale of Neath, etc.

**Chemical Industry.**—The ordinary monthly meeting of the Liverpool section of this society was held on the 14th inst., Mr. A. Norman Tate in the chair. The proceedings opened with a discussion on two papers read before the last meeting of the section by Captain Abney and Messrs. Hurter and Driffield on "The Sector and Grease Spot Photometers and their Results." Dr. Hurter then read a paper by himself and Mr. V. C. Driffield on "The Relation between Photographic Negatives and Positives," a continuation of their photochemical investigations, the first portion of which has been published in the journal of the society. A paper by Mr. J. T. Redwood on the "Conversion of the Nitrogen contained in Acid Sludge into Ammonia" was read by Dr. C. A. Kohn, in the absence of the author.

**Croydon.**—Between thirty and forty members assembled on the 19th inst., the President, Mr. H. Maclean, being in the chair, to hear an address by Mr. A. R. Dresser on "Hand Camera Work." The lecturer's remarks, which were by turns humorous and instructive, were attentively followed by an appreciative audience, who seemed greatly to relish the opportunity of listening to so characteristic an exponent of matters photographic.

**Croydon Microscopical.**—The 16th inst. was a lantern night, when a good selection of over 200 slides by members were passed through the lantern during the evening. The next ordinary meeting will take place on February 6th, and a lantern night on the 20th February.

**Ealing.**—The members of this society met on the 15th inst., when the chair was taken by the President (Mr. H. W. Peal). Two new members were elected. The set of slides, "In and Around Columbus," were passed through the optical lantern and much appreciated. Views by members were also shown.

**Formby.**—The Hon. Secretary writes as follows:—"In the death of their President, the Formby Camera Club loses its most active member. The gentleman in question (Mr. R. E. Maclean) was appointed President on the formation of the club two and a half years ago, and had been three times re-elected. He was an enthusiastic amateur photographer, and turned out some very creditable work at the local exhibitions. His interest in photography dated back to the old wet-plate days, since which time he kept himself well abreast of all latest advances and improvements, and the club benefited by his devotion to the black art. His familiar figure at the ordinary meetings, and his genial manner and his readiness to assist in all matters photographic, endeared him to all the members. His death took place at his residence 'Kingsleigh,' Freshfield, on December 27th, after only a week's illness.

Owing to the above sad event, the club did not meet on the 12th inst. The fixture for the meeting was a demonstration on bromide enlargements by the late President. The next meeting will be held on the 26th inst."

**Glasgow.**—The usual monthly meeting was held on the 15th inst., Mr. Wm. Lang, jun., F.C.S., President, in the chair. The following gentlemen were unanimously elected members:—Professor J. G. McKendrick, M.D., F.R.S., Mr. Arthur Robinson, Mr. David Johnson, Mr. Matthew Edwards. A resolution expressing regret at the death of Mr. A. Schulze, F.R.M.S., and the loss the society had sustained, was unanimously agreed to. Mr. J. Adamson, jun., Rothesay, gave a practical demonstration of a method for taking instantaneous pictures indoors by means of Slingsby's magnesium flash lamp. Two plates were successfully exposed and developed during the meeting.

**Graphic (Plymouth)**—The 7th annual meeting was held on the 12th inst.; Mr. R. Murray in the chair. The Secretary's report having been read, the Treasurer made his statement of the finances, which showed a balance in hand. The retiring officers, Mr. Murray (Chairman), Mr. Watson (Treasurer), and Mr. Hawker, were unanimously re-elected and heartily thanked for their past services. Miss Gidley, Mr. H. R. Babb, Miss Stoye, and Mr. J. B. Foster were chosen as members of the Council. On January 26th Mr. Babb will give a lecture on "How Artistic Sight Differs from Ordinary Sight."

**Greenock.**—The second annual exhibition of members' work was opened in the Watt Museum Hall on the 9th inst., and on the 10th a lantern exhibition was given in the same place for the benefit of the Greenock Infirmary. Both exhibitions were a great success.

**Holborn.**—The usual weekly meeting was held on the 16th inst., Mr. Golding in the chair. The Secretary read a paper by Mr. E. J. Wall (who was unable to attend personally), on "Notes on the Early History of Photography prior to 1800," which was pregnant with a great deal of useful information.

**Huddersfield.**—The monthly meeting, held on the 13th inst.—the President, Surgeon-Major Foster, in the chair—was a lantern evening.

**Keighley**—The annual conversazione and competition was held on the 5th inst. In the competition, in addition to certificates, a silver and a bronze medal were offered for the best collection of photographs exhibited in three classes. The silver medal, however, has been withheld, but the judges placed on record that, had Mr. S. Bairstow complied with the conditions, he having restricted himself to landscape, his excellent work would have entitled him to the medal. The bronze medal goes to Mr. James Waters. The Judges were Mr. T. C. Butterfield, art master, and Mr. Clement Williams, F.R.I.B.A., Halifax. The latter decided questions in reference to technique. The following are the awards:—Seniors.—Landscape or seascape: first prize certificate, S. Bairstow; 2, James Waters. Genre pictures: prize withheld. Architectural subjects: first certificate, withheld; 2, James Waters. Enlargements: Walter Mitchell; 2, John Gill. Portraiture: first, withheld; 2, T. Heaps. Transparencies: J. W. Laycock; 2, T. Heaps. Architectural subjects within the borough: first, withheld; 2, Ellis Myers. Mechanical subjects: prizes withheld. Juniors.—Frank Gill; 2, W. H. Hainsworth.

**Kendal.**—The usual monthly meeting was held on the 14th inst., Mr. F. Wilson, J.P., in the chair. Two new members, Messrs. J. R. Bridson, Brarwood, Sawrey, and D. Rose, Staveley, were elected. Mr. C. W. Hastings' report on the prints competition was read, and the prints exhibited. The business of the evening was a paper on "Some Practical Hints in Photography," by Mr. John Armistead (Dalton), who gave many valuable hints and suggestions.

**Lantern.**—At the meeting of the 12th inst., Mr. E. M. Nelson, F.R.S., read a paper on "The Lantern in its Relation to Photography and the Microscope."

**Leicester.**—A regular meeting of the Society was held on the 15th inst., Mr. S. S. Partridge (President) in the chair. The election of officers for the ensuing year was then proceeded with—Mr. J. T. Cook, V.P., President; Mr. F. G. Pierpoint, Vice-President; Committee: Messrs. Porritt, Joliffe, Bankart, Partridge, and Weatherhead; Mr. Wilson, Treasurer; and Mr. H. Pickering, Secretary.—An interesting and instructive evening was passed on the 16th inst., when Mr. E. Howard Jaques, of Birmingham Photographic Society, came to lecture before the Society on "A Trip Through Western Norway."

**Louth and District.**—The monthly meeting of this Society on the 14th inst. was made the occasion of a semi-public exhibition of lantern slides. The meeting was held in the Council Chamber of the Town Hall and was fully attended, admission being by complimentary tickets only, each member having six at disposal. The number of slides exhibited was 174, being sixteen sets of ten slides each, and portraits of some of the artists. To each set had been awarded a prize in the 1890 annual competition for this class of work held by the proprietors of the AMATEUR PHOTOGRAPHER. Four classes of subjects were included in the competition: (1) landscape, etc.; (2) figure studies and genre; (3) animals and instantaneous; (4) architecture.

**Madras.**—The fifth half-yearly competition took place on the 3rd December, at the Masonic Hall, Mount Road. The subject for competition was a "A Study of Architecture," and twenty large and twenty-five small pictures were submitted to the judges, whose awards were as follows:—Large views—silver medal, Mr. F. Dunsterville; bronze medal, Mr. F. Dunsterville; certificate of merit, Mr. J. C. Hannington. Small views—silver medal, Mr. F. Dunsterville; bronze medal, Mr. F. Dunsterville; bronze medal, Mr. E. W. Stoney; certificate of merit, Mr. E. W. Stoney; certificate of merit, Mr. O. Michie-Smith. Lantern slides—silver medal, Mr. E. W. Stoney; bronze medal, Mr. F. Dunsterville. A special prize for the best landscape was competed for by eighteen views, and the prize (a set of photographic apparatus presented by Messrs. W. E. Smith and Co.) was awarded to Dr. A. G. E. Newland.

**Newcastle-on-Tyne and Northern Counties.**—The annual meeting was held on the 13th inst., Mr. J. P. Gibson in the chair. The officers elected for the current year are as follows:—President, Mr. A. S. Steavenson, J.P.; Vice-Presidents, Mr. J. P. Gibson, Mr. H. R. Procter; Treasurer, Mr. John W. Robson; Secretary, Mr. Edgar G. Lee; Council, Messrs. M. Auty, J. Brown, J. E. Gould, T. O. Mawson, F. Park, W. Parry, H. G. Ridgway, J. H. Robinson, H. Shand, L. Williamson. Mr. Edgar G. Lee read a paper on "Lantern Slide Making," and Messrs. Lee and Brown demonstrated the development of lantern plates, the former using Thomas's hydroquinone formula, and the latter Warnerke's eikonogen formula, diluted, and restrained with brom. pot., 2 grains to the ounce. Successful slides resulted. The lantern was afterwards brought into requisition, and about 150 slides put through.

**Peterboro.**—The monthly meeting of the Society was held on the 15th inst., to have the 1890 prize slides, kindly lent by the Editor of the AMATEUR PHOTOGRAPHER, exhibited on the screen.

**Putney.**—At the meeting on the 10th inst. the following gentlemen were elected upon the Council for 1891:—President, the Hon. Baron Pollock; Vice-Presidents, Mr. T. Gilbert, Rev. L. Macdonald; Council, Mr. Chas. Ballard (Hon. Sec.), Mr. E. V. Barrett, Mr. W. H. Congreve, Dr. J. F. Farrar, Mr. W. F. Gorin, Mr. J. C. Leman, and Mr. M. S. E. Manifold. The meetings of this Society are held fortnightly, on the second Wednesday and last Saturday in each month. Ladies and gentlemen desirous of joining are invited to communicate with the Hon. Sec., 46, Erpingham Road, Putney. January 31st, Ilford special lantern plate demonstration.

**South London.**—An ordinary meeting was held on the 16th inst., Mr. F. W. Edwards in the chair. Mr. Leon Warnerke gave a demonstration of "Photo-Mechanical Printing Processes," consisting of a lucid description and practically working the collotype process before the members.

**Staff. Potteries.**—At the monthly meeting on the 13th inst., one new member was elected. The evening was given up to lantern work; new slides made by members were passed through and criticised, and Mr. E. B. Wain gave a short paper on "A Week's Holiday in the Isle of Man."

**Stockton.**—The annual meeting was held on the 14th inst.; Dr. Stainthorpe (President) in the chair. The Treasurer read his annual report, which showed a balance in hand of nearly £3. Dr. Stainthorpe was re-elected President; Mr. Rhodes, Treasurer. The following gentlemen were elected members of the Council:—Messrs. Jackson, Appleby, Graham, Moul, Draper, and Bradley, Mr. Ellan agreeing to undertake the duties of Secretary.

**The Photographic Society.**—At the ordinary meeting held on the 13th inst., Capt. W. de W. Abney in the chair, nine new members were elected; auditors and scrutineers were appointed; gifts from P. H. Emerson, Esq., "Life on a Tidal Water," and E. Cocking, Esq., a collection of year-books of the *British Journal of Photography* and *Photographic News*, to the library, were shown, and votes of thanks were passed to the donors. It was announced that the progress medal had been awarded to Colonel J. Waterhouse, B.Sc., and that an exhibition of photographs and apparatus would be opened at St. Petersburg on March 29th. Mr. E. W. Maunder, F.R.A.S., then read a paper, illustrated by a large number of lantern slides, on "Photography as Applied to Astronomy." It was announced that the anniversary meeting would take place on February 10th, and the annual dinner would take place at the Café Royal on the 9th.

**Torquay.**—The monthly meeting was held on the 13th inst., when a very interesting paper on "Platinotype" was read by Mr. George Edwards. Afterwards several very successful experiments in development were made.

**Toynbee.**—The 15th inst. was a lantern evening. The club was indebted to the Boston Camera Club for the loan of their excellent set of slides, "The White Mountains of New Hampshire," the beauty of which was much admired by an appreciative audience. A few slides illustrative of life in East London were also passed through the lantern.

**Tunbridge Wells.**—The fourth annual meeting was held on the

7th inst., the President, Mr. F. G. Smart, in the chair. Messrs. Lauder, Wilson, and Penn were duly elected members. The following officers were re-elected: President, Mr. F. G. Smart; Vice-Presidents, Mr. J. G. Calway, Rev. A. T. Scott, Rev. J. E. Rogers, Mr. G. Percival Smith; Hon. Treasurer, Mr. B. Whitrow; Hon. Secretary, Mr. Joseph Chamberlain; Hon. Auditor, Mr. W. E. Bramp'ou; Committee, Messrs. J. W. Morgan, A. W. Pierson, G. W. Howard.

**Ulster.**—The fifth annual meeting was held on the 12th inst. Mr. William Swanton, F.G.S., Vice-President, in the chair. The following were elected office-bearers of the Society for the year 1891:—President, Mr. Alexander Tate, C.E.; Vice-Presidents, Mr. William Swanton, F.G.S., Mr. John Brown; Committee, Messrs. J. J. Andrew, E. Braddell, S. B. Coates, M.D., W. H. Drennan, R. J. Evans, W. Gray, M.R.I.A., J. Stelfox, J. Wilson, M.E.; Honorary Treasurer, Mr. S. D. Neill (12, Donegall Place); Honorary Secretary, Dr. Cecil Shaw (14, College Square East).

**Wallasey.**—The monthly meeting was held on the 7th inst., the Vice-President, Mr. C. B. Reader, in the chair. The meeting took the form of a lantern entertainment. About 200 slides were exhibited. Mr. Donald Kendall was adjudged the winner in the lantern-slide competition, showing some very fine views in North Wales, and Mr. H. Wilkinson was awarded the silver medal in the print competition. Mr. Wilkinson has also carried off this season first prizes at the Liverpool and Birkenhead societies' competitions.

**Wimbledon.**—The members of the recently formed amateur photographic society of Wimbledon spent a pleasant evening on the 9th inst., when there was a goodly muster for the first lantern evening. Excellent slides were exhibited by Messrs. Oliver, Mitchell, Whitfield, Edsall, and Rev. H. Allfree, and sufficient evidence was given of the mutual advantage and pleasure afforded by a combination of disciples of this delightful art.

**Woolwich and District.**—An exhibition of the American lantern slides took place on the 15th inst. The slides were very much appreciated, and a very pleasant evening was spent.

## Quarterly Examinations in Photography.

**Question 1.**—Give the salient points to be observed when choosing a camera and tripod?

**ANSWER.**—*The camera.* The salient points of a camera, for the general use of an amateur, are as follows:—

- (1) The framework must consist of well-seasoned wood (mahogany), dovetailed and screwed together.
- (2) The bellows should be of leather, which is more lasting than cloth, and of the conical pattern, which allows of the wood front being much smaller and lighter, and also allows of the camera being compactly closed up.
- (3) The focussing arrangement should be effected on the "rack-work" principle, and the construction of camera should allow of "double extension" focussing.
- (4) The front should be provided with cross movements, so that the lens might be moved either vertically or horizontally from the centre as circumstances should determine.
- (5) The camera back should be constructed on the "reversing" principle, which readily allows of change from the horizontal to the vertical position. It should also be provided with mechanical con-

trivances, so as to allow of its swinging in both a vertical and horizontal direction.

(6) The focussing screen should be secured by hinges, so as to fold over the camera top, on the insertion of dark-slide.

(7) The dark-slides should be double and of the book pattern. These should especially be of good materials and workmanship, as any warping or shrinking would admit light and render the slide useless.

**The Tripod.**—The tripod consists of two parts, viz., (1) head and (2) legs. The head should be of sufficient size as to reach quite, or very close, to the edges of camera base-board. (2) The legs should be made on the two-fold principle, but, instead of the lower half folding between the two struts of the upper part, it should slide up between them. This method allows of moving the camera up or down without moving the points of support. The connection between legs and the head should be secured by screws, or, better, by springs, as in the Ashford stand, so as to ensure perfect rigidity.—LINDUM.

**Question 2.**—How would you choose a lens?

**ANSWER.**—The choice of a lens depends on the work it will have to do. For landscape work a single lens is by far the best, and is certainly the best all-round lens for small-sized plates. Long-focussed lenses for large plates are always slower than those of short focus, and the single lens becomes too slow for general work. For quick work the lens should be a Rapid Symmetrical or Euryscope. For architecture in large sizes a symmetrical lens is a necessity, but up to whole-plate the distortion of a single lens is not noticeable, and the resulting picture has greater brilliancy than when taken with a doublet.

The working apparatus and uses of most modern lenses of moderate size are as follow:—Single meniscus or plano-convex,  $f/10$ , views and general work; rapid symmetrical,  $f/8$ , architecture, portraits, general; euryscope,  $f/6$ , hand-cameras, instantaneous work, portraits; portrait lenses,  $f/4$  to  $f/2$ , portraits and large heads.

The lens should cover the plate to the edges with a sensibly uniform illumination. It should focus sharply with the largest stop. Flare-spot and ghost should be absent; inside of mount should be dead-black. Lenses should be removable for cleaning, and should be accurately centred. The visual and actinic foci should coincide.

For all purposes I use a cheap quarter-plate meniscus, working at  $f/10$ . With it I have taken a train at full speed and an interior of a church, half-plate, with no perceptible distortion.—C.

**Question 3.**—What is the best form of instantaneous shutter, and why?

**ANSWER.**—(1) One that reduces vibration to the minimum, *because* in a rapid exposure any small vibration blurs the picture.

(2) One that will fit several sizes of lenses, *because* it saves expense.

(3) One that has few parts in it, *because* there is less to get out of order.

(4) One that will allow of regulation in length of exposure, *because* in different lights and on different subjects this is a necessity.

(5) One that allows of exposing one side of the plate longer than the other, *because* in certain cases—e.g., street scenes—one side may be in shadow and the other in sunlight.

(6) A pneumatic discharge ball and tube is useful, *because* it lessens the liability to shake the camera as in a hand discharge, and also because (vanity of vanities!) the operator can take his own portrait!

(7) One that is solid in make, yet light and small, *because* "many a mickle makes a muckle."—BIARRITZ.

## To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign

all Queries and Answers with name or *nom de plume*.

4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.

5. The Editor does not undertake to answer questions by post.

6. In answering Queries, correspondents are requested to mention, in every instance, the *number and full title of the query* referred to.

## QUERIES.

4460. **Speed of Shutter.**—Could any reader inform me how to measure the speed of a drop shutter?—O. APPLETON.

4461. **Roll-Holder.**—Will someone who has had real experience in Eastman's films give me his opinion as to the advisability of getting a roll-holder instead of using glass negatives? Are they much trouble to manipulate? Any hints as to development, exposure, etc., being acceptable.—QUANDARY.

4462. **Shutter.**—Could anyone tell me of a good shutter that will work up to about  $\frac{1}{1000}$ th of a second, price to be from 12s. to 15s?—W. F. S.

4463. **Photo-Mechanical.**—Will someone kindly give me the name, publisher, and price of a text-book on a photo-mechanical printing process, and which is the best for an amateur to go in for?—BENES.

4464. **Lacquering.**—Will some reader kindly instruct me on the making of brass lacquer, and applying same to camera fittings?—NIKLE.

4465. **Camera Bellows.**—Can anyone tell me the best material in cloth to use in making a bellows for camera?—NIKLE.

4466. **Loss of Tone, Matt Surface Prints.**—Using Scholzig's matt-surface paper to obtain a beautiful purple, when in toning bath (tungstate, advised by Scholzig), but by time prints are fixed and washed, this beautiful tone gives place to a brown colour. Observe their instructions to the letter; soak in one water before toning, for two minutes only, use toning bath tepid, fix in 3 oz. hypo to 20 of water; but tone disappears, even if I tone them to a cold blue. Would anyone kindly tell me how I can obtain the purple tone? I print deep, fix 15 minutes.—COLONIST.

## ANSWERS.

4446. **Matt-Surface Paper.**—In using this paper you must print deeper than ordinary albumenised paper. Any toning bath is suitable, but the amount of gold should be less for this paper than silver. I have, however, often toned prints on albumenised paper and matt-surface paper together, and obtained very pleasing results. —HAMISH.

4448. **Toning Obernetter Paper.**—Do you replenish your bath sufficiently with gold? If not, then this is the most likely reason why it will not act. —HAMISH.

4450. **Developing Bromide Prints** depends on what developer you use. Hydroquinone can be used over and over again until it fails to render the details of the picture satisfactorily. Pyro can only be used once. —O. APPLETON.

4450. **Developing Bromide Prints.**—In my opinion, the best results are obtained by using the developer over and over again, and adding a little fresh solution now and then. —HAMISH.

4452. **Bromide Paper.**—The papers manufactured by the firms mentioned are all very good, and, in the hands of an experienced manipulator, very beautiful results can be obtained. For myself, I prefer the paper made by Messrs. Morgan and Kidd. —HAMISH.

4454. **Exposure.**—According to meter (Watkins), your exposure ought to be about 178 sec. —ELGIN.

4454. **Exposure.**—Actinometer 60, plate 11, subject 1 (or 100),  $f/32$ , gives 100 secs. exposure. It is difficult to guess cause of error; but, presuming you are using Thomas's slow landscape, I have lately found 8 or 8 the best number to use with them, in order to avoid under-exposure. All slow plates are liable to have even less sensitiveness to feeble rays of light than the actinometer shows, and some rapid or isochromatic plates slightly greater sensitiveness. If it is a matter of considerable under-exposure, please write me direct. Perhaps you are using the earliest issue of sensitive paper. The present issue is a great improvement. The instrument you have is one of the early issues. —ALFRED WATKINS.

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING's post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret. —ED: AM: PHOT:

**NOTE.**—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.

S. W. P. COWAN.—Baedeker's is the best; there is no photographic guide. It is advisable to apply to the police. The exposure would be slightly less—about one-sixth less.

CLIFFORD D. FOTHERGILL (Blarritz).—(1) Nadar, 53, Rue des Mathurins, Paris, is the chief agent; J. Robaud, 7, Rue Massina, Nice; Brearley and Bascoul, 77, Rue d'Antibes, Cannes; Collier, 17, Avenue Victor Emmanuel, Mentone. (2) Yes, though probably it would not be fully exposed. (3) Try Nadar. (4) Quite as good.

MUWA.—(1) Add No. 2, or try an old developer. (2) Old developer first, then fresh. (3) Fresh developer, excess of No. 2. (4) Reduce No. 2, increase No. 1. (5) Add bromide.

GIAOUR.—(1) The angle included is precisely the same, and, therefore, the images will be identical. (2) We prefer the colour-sensitive. (3) Much better. (4) No. 2 decidedly. (5) We have had excellent results on them.

C. E. F.—The commercial is quite pure enough. E. WINN.—The bath is a great deal too strong; make it up to about double the quantity, make the bath up to 12 oz.

J. K. G.—Bromide paper for development, a gelatino-chloride paper for printing out. (1) Very good, but spoilt entirely by the incongruous figure. (2) Slightly too thin. (3) Good.

J. W. LAYCOCK.—The best plan would be to study the Exchange column, or we would do it for you if you would let us know.

H. G.—We should place them in the following order—3, 4, 2, 5, 1.

E. BUCK.—A part consists of any quantity, i.e., one ounce may be the one part, then a half part would be half an ounce; equal parts would then be one ounce of each. Two parts of water under the same conditions would be two ounces.

E. J. P.—Any of them are good, but we like No. 3. The same description applies to the second question; the order would be, probably, B, D, C, A.

W. P.—Both are over-exposed. You might try intensifying the negatives. The tree in the foreground of No. 1 is out of focus. Over-exposure is probably the cause of the latter defect.

X. X.—You might select any one, as they are all good instruments. We should place them—3, 4, 5, 7, 1, 2, 6. Surely you could have focussed better

with the lens you mention. Did you use a stop or the full aperture?

E. S. ROBERTS.—(1) You should have used a smaller stop in the case of No. 1; the edges are quite out of focus. No. 2 is better, but still not sharply focussed. (2) Either paper is good, and will give equal results if properly worked. (3) Yes. Send us some more specimens after a month's practice.

BOLTON.—The photographs are fairly good, No. 1 being the better of the two. You are doing very well. The lenses you mention will clearly do good work. We cannot answer your last question, as everything depends on the work of the other competitors.

A. WIGGINTON.—(1) We believe so. (2) We do not know that they are preferable, but they are certainly as good. (3) We should think they could.

STEPHEN D. HAYWORTH.—If we have any preference, it is for C. D. as perhaps more compact than the others and less liable to warp or stick.

SALTED PAPER.—180 grs.; see Clark's "Platinum Toning," to be got from our publishers. We should prefer ammonio-nitrate.

H. C. HALL.—No. 1 is a good print, but the negative is capable of better results. (2) Over-exposed; the standing figure spoils the grouping. (3) Is very bad both as regards focus and printing. (4) Is really a little picture, well printed. (5) Good. (6) Under-exposed. (7) Badly focussed. (8) Very good. (9) Very good.

JOSEPH CHAMBERLAIN.—The chest and photograph reached us safely, for which please accept best thanks.

HUGH L. BRIDGER.—When the slides come back, will revise the titles. Very glad your friends were so well pleased.

F. B. BROWN.—Shall have pleasure in lending you slides at any time.

J. W. HORTON.—We have duly received your letter with *nom de plume*. Certainly.

H. A. HALLIWELL.—We note contents of your letter. Your suggestion is under consideration.

W. SMEDLEY.—There will be no objection, we think, to your exhibiting the print in the portrait class at Liverpool. Write Mr. Mayne about it.

C. W. TOWNSEND.—Next Monday, at 5 p.m., admitted upon presentation of your visiting card. No advantage would be gained.

A. W. BULLEN AND J. H. NUNN.—Thank you for the information.

JOHN H. MONTAGUE.—Write to Mr. Bynoe, Photographic Dealers and Manufacturers' Association, Southampton Row, W.C. They will probably investigate the matter. We cannot spare the space. We think that the matter speaks for itself, and are surprised that people should be so gullible. Many thanks for good wishes, which we reciprocate.

J. ANDREWS.—Your letter to hand on return to town. The publishers will send copy of *Quarterly* as requested.

M. DE DECHY.—Kindly send us on negatives that you may select as soon as possible.

H. HOLT.—Will look up the MS. Any of the printing papers you name are of first quality.

S. FRANCIS CLARKE.—Thanks for your letters. The slides reached us safely at Ventnor. We will have the slides replaced.

W. H. SHIRLEY.—Glad to have your kind message.

H. MACLEAN.—Will write you later on.

F. A. WALLER.—The publisher has written to you.

MARTIN J. HARDING.—Let the photographs come to us in the middle of each month at latest for criticism in *Reporter*. We should like to have them in our possession at least a fortnight.

A. W. GOTTLIEB.—You do not quote the paper, and some very odd statements are made in daily papers.

J. R. ELAM.—Your application shall have attention and we will write you in a few days.

G. B. BETHEMANN.—The portrait of Herr Schloesser will be reproduced in the *Reporter*. Thanks for the notes.

A. D. GUTHRIE.—Will send on certificate in a few days.

A. W. NICHOLLS.—Very glad to know that the 1890 prize slides gave such satisfaction.

CAPT. DE CERSIGNY.—The medal is in hand, and may be expected in a week or so.

W. GEO. HALL.—Shall be pleased to see your work. Why not have down a set of our "Monthly Competition" prints (packing fee, one shilling)? You would get many wrinkles from them. Very glad you find the AM: PHOT: so useful.

HENRY KILBURN.—Sorry to have been so discourteous. Have written you this week.

W. T. BARTON.—Send in again, and we will try and give a little more attention to your contribution. Also, in order that mistakes should not be made, write legibly.

G. E. MALLEHAM.—*Photography* advertised some "American slides," but we know nothing about the loaning of them.

G. FAIDA (Venezia).—The prints sent certainly show what can be done; but still we think that a good deal of the fog is due to the process which the plates have to undergo. In the December *Heft*.

*Photographische Rundschau* a similar instance occurs; it was probably just one box defective.

PLATO.—We should purchase as follows:—No. 3, of  $8\frac{1}{2}$  in. focus, and No. 7, of  $6\frac{1}{2}$  in. focus, or, instead of the latter, a  $6\frac{1}{2}$  in. and 15 in. focus landscape lenses. The Iris are more convenient. We will consider your suggestions.

F. POWELL.—We will write you privately.

FRANKY.—You give us no idea of what the object is again: the white background, whether copying or portraiture. Let us know this, then we can help you. For bromide paper use Eikonogen developer. It certainly gives good results, with less trouble than ferrous oxalate. Ten grains of magnesium will give a good flash. Use extra-rapid plates, with ribbon and red-color; the lighting is more under control, of course. You would find your present lens (if too long a focus for detective work. The meter you use is a good instrument.

F. PARTIDGE.—It is almost a matter of indifference. The weaker the bath the slower the toning, and, consequently, a greater tendency to brownish tones. If the water is used at about 80 degs. Fahr., 1 gr. to 10 oz. is a good strength. If cold water is used, the bath must be stronger.

E. S. R.—It is a pity the negative is not evenly stained. We should be inclined to try and make a transparency from the negative, and then soak the negative in weak ammonia water, wash, and then soak in weak hydrochloric acid. If you like to send the negative to us we will try and help you.

JOHN A. WALTON.—(1) We should prefer  $6\frac{1}{2}$  by  $4\frac{1}{2}$ , and use a half-plate long-focus square belows camera, such as B, and use carriers, so that you could use the camera with the ordinary half-plate if desired.

H. TONKIN.—In the number for February, 1889. See also Stingsby's book on the subject, published by Marion and Co.

ANDREW MCKINDLAY.—Many thanks. We will advise "Memnon."

R. DILLON.—Will reply next week.

MRS. BEXYON.—Will write to you.

NIECK.—They can be thoroughly relied upon.

Will reply fully to your letter by post.

T. KIDD (Spain).—The form shall be sent you, and at the same time we will reply to your questions.

GEO. PHILIPS.—At the time of writing cannot help you. Should we be able to answer your question, will write you.

J. HARRISON.—Thanks for your letter. There can be no reason why you should not advertise.

## Quarterly Examinations in Photography.

## QUESTIONS.

- Describe the methods for testing a lens for chromatic and spherical aberration, the aberration of form, the aberration of thickness, and the aberration of position of lenses.
- What is the meaning of the terms chemical and visual foci? Explain the principle of constructing an achromatic doublet from two uncorrected lenses, if this can be done?
- What is a "flare" and a ghost, and how are they caused?

(Latest Day for Answers—January 26th.)

## RULES.

- Answers must be received on the morning of the Monday week following the publication of the question.
- All answers must be preceded by the question and should be written on one side of the paper only.
- A *nom de plume* may be used, but in every case the full name and address must also be given.
- Answers must not exceed 250 words, unless otherwise stated by the examiners.
- Those desirous of competing must apply to have their names entered, as these examinations are intended to encourage the study of the theory and practice of photography. Authorities upon photographic matters and contributors to the photographic journals will not be allowed to compete.

Marks will be given for all answers, and when possible, the three best answers will be published. Three prizes will be awarded at the end of each quarter.

All communications to be addressed:—

"EXAMINATION DEPARTMENT,"  
AMATEUR PHOTOGRAPHER,  
1, CREED LANE,  
LONDON, E.C.

## Lantern Slide Exchange.

**NOTE.**—There is NO CHARGE for insertion in this column. All announcements must be received by Tuesday morning.

H. K. Bridger, Japonica Cottage, Stanley Road, Twickenham, wishes to exchange slides of Thames, Wye, Glamorganshire, London, etc., for slides, unmounted, on approval.

## Sale and Exchange.

**RULES.**—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

**REPORTING UPON APPARATUS.**—The Editor of the AMATEUR PHOTOGRAPHER will be pleased to report, to any intending purchaser, upon apparatus, etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the seller to him to the offices of the AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending buyer to pay a fee equivalent to a commission of 2½ per cent., the minimum being one shilling, upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the seller. As far as possible, the Editor will undertake to send a report within TWO DAYS of receipt of goods.

### DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

Advertisements can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 6d. to cover postage.

**N.B.**—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

"Amateur Photographer," Nos. 182 to 273 (one missing); offer wanted.—Benson, Havelock Terrace, Worthington.

"Amateur Photographer," etc.—AMATEUR PHOTOGRAPHER, vols. ii. to viii., variously bound (vols. iv. and v. incomplete), vols. ix., x., xi. in reading cases, vol. xii. in parts, 5s. the lot; "Photographic Reporter," vols. i. and ii. in parts, complete, with loose plates, 5s.; purchaser pays carriage. — W. A., 48, Warwick Gardens, London, W.

**Cameras, etc.**—Lancaster's Watch camera, with three dark-slides, cost 31s. 6d. a week back, also three extra slides and three dozen plates; what offers? or would exchange for Stirn's Waistcoat camera or other hand-camera. Reason for selling, have bought larger camera.—Apply, C. Hudson, 4, Esk Villas, Joscelyn Road, Richmond, Surrey.

Whole-plate camera, 1 rather bellows, all movements, three double slides, in first-class condition, a bargain; £4 10s.—J. Smith, 176, Birchanger Road, Norwood Junction.

Half-plate Instantograph, stand, changing bag, waterproof case, Watkins' meter, Rubralux lamp, dishes, frames, etc., good condition; 95s.; or offer.—Wardale, Market Place, Newark.

**Cameras, Lenses, etc.**—Condenser, 10 in., two ledes, mounted on mahogany base and iron standards, also enlarging camera, 12 by 15, with carriers to quarter plate; £7 7s.; or sell separately. — W. Wells, 14, Girdler's Road, West Kensington.

Camera, Lancaster's Instantograph half-plate, all latest movements and improvements, reversing back, leather bellows, etc., Instantograph lens, Iris stops, and instantaneous shutter, double dark-slide, carrier, and folding mahogany stand; 75s.; approval.—Wells, 31, Woodale Road, Walthamstow.

Want to sell the following of my photographic accumulations:—4B Dallmeyer's portrait lens, 16 in. Ross' R.R. (12 by 10), Hughes' patent enlarging apparatus, rectangular condenser, special lens, lime-light apparatus, with 12 ft. Bryn's oxygen cylinder, enlarging up to 10 by 8 negatives, cost £32; 15 by 12 Watson's long-extension Tourist camera, three double dark-slides, Beck's 24 in. R.R. and W.A. lenses, both Iris diaphragms, Kershaw double blind shutter, tripod, Key hand-camera, brass bound, six double plate-holders, and arrangement for connection to tripod, Shew's Eclipse quarter-plate hand-camera, six double backs, view-finder, and focussing screen; make offers, subject approval, Editor, AMATEUR PHOTOGRAPHER, or other personal inspection, to No. 100, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Lancaster's quarter-plate Instantograph camera, lens, tripod, double back, instantaneous shutter, quite new, warranted perfect; 30s.; deposit.—No. 102, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Whole plate long-extension camera, leather bellows, dark-slide, portrait lens (cost £8), dishes, chemicals, and backgrounds, new condition, cost £20; offers.—Higginshaw, Oldham.

**Condensers, etc.**—Two condensers and front lenses for optical lantern, 25s.; whole-plate combination lens, three foot, Iris diaphragm, 40s.; Wellsbach incandescent gas burner, 10s.; view-meter, 1s. 6d.—Wills, 21, Wordsworth Street, Cardiff.

**Hand Cameras, etc.**—Griffiths' guinea detective camera, three double backs, scarcely used; 12s. 6d.—P. Forster, Elmbank, Darlington.

Detective camera, Kerr's patent (by Abraham), 12 plates, rapid rectilinear lens, adjustable instantaneous shutter, weighing, complete, 7½ lbs.; cost £7 7s.; accept £4.—E. Clark, 57, Addiscombe Road, Croydon.

**Lantern.**—Massive binomial, brass fronts, jets, dissolver, slides, new condition, cost £35; £20, offers.—Higginshaw, Oldham.

**Lantern Slides.**—Antwerp, Brussels, Waterloo; 23 lantern slides of above places, in box; price 30s.—Address, Engraver, 10, Northcote Street, Beeston Hill, Leeds.

Will exchange set of (12) "Heroes of the Victoria Cross," coloured, and 50 others, views in Wales, etc., for a three-fold whole-plate tripod; slides can be seen by appointment.—Sims, 5, Peel Grove, Bethnal Green.

**Lenses.**—Ross' half-plate rapid symmetrical lens, with diaphragms, complete; 70s.; bargain.—Barton, Morriston, Elgin.

Levi's portrait lens, 15s.; lantern objective, 10s.; Lerebours and Secretan's quarter plate portrait lens, 20s.; quarter plate portrait lens, 15s.—F. R. Upcott, 135, Brigstock Road, Thornton Heath. (Can be seen at the offices of the AMATEUR PHOTOGRAPHER.)

For sale, a 7 by 5 Optimus Ruryscope lens, quite new and guaranteed. — For price, write to Thomas Usher, Bates Cottages, Holywell via Backworth, Newcastle.

Half-plate portrait lens and quarter-plate ditto (by Burr), sell or exchange for Taylor's and Wray's 8 by 5 R.R., with Iris, and quarter-plate roll-holder, cash to value.—M. Mallett, 227, Finchley Road, N.W.

**Lenses, etc.**—Lancaster's half-plate Instantograph lens and shutter, complete, perfect; 17s. 6d.—A. H., 32, Crosby Street, Derby.

Optimus 5 by 4 R.L. lens, with Place's shutter; cost £2; price 26s.; as new.—Thornton, 15, Bromley Road, Beckenham.

**Magic Lantern, etc.**—Magic lantern, 4 in. condensers, portrait lens, three-wick lamp, and 70 slides, also 10 ft. sheet; will exchange for photographic apparatus, whole-plate preferred, or Safety bicycle.—Caesar, 24, South Western Road, Twickenham.

**Sets.**—Underwood's 1880 half-plate instant set complete, as new, bargain, 67s. 6d.—H. Rowe, Wallbridge, Stroud.

Sale or exchange, whole-plate outfit, also bur-

nisher and press.—James Ingham, New Mills, near Stockport.

**Sundries.**—Will exchange a good rifle of the French army (the Chassepot) with bayonet, or a good French horn (cor de chasse), for a good hand-camera, approval.—Bousselle, Glenleigh, near Hastings, Sussex.

Offers? 15 ft. oxygen cylinder, brass screw regulator, panoramix carrier, cost 10s. 6d., blow through jet, all perfect order together or separate.—T. Fawcett, King's Langley.

**Washers.**—Wood's washer, new, with adjustable rack, cost 17s.; exchange brown leather gun-case.—Jas. Higgin, Athenaeum, Manchester.

## WANTED.

"Amateur Photographer."—AMATEUR PHOTOGRAPHER in exchange for *British Journal* from October 31 last, and weekly.—Jas. Higgin, Athenaeum, Manchester.

**Burnisher.**—Half-plate burnisher; exchange handsome pair of opera glasses in case.—D. White, Stores, Ardington, Wantage.

**Cameras.**—Kodak No. 1, cheap, approval.—C. Willmot, 1, St. Paul's Place, Canonbury, London, N.

Whole-plate camera, long focus, reversible back, one or more double slides, cash on approval.—Roberts, 28, Harrington Road, South Norwood.

Good hand-camera, perfect condition, approval; exchange lathe, 8 feet bed, and Rogers' fret machine.—Turner, Woodville, Lytham.

Lancaster's quarter-plate Instantograph, complete, must be in perfect condition and cheap.—Thompson, care of Nokes, 18, Frenchwood Street, Preston.

Half-plate camera for cash, or exchange dissolving view outfit.—A. D. Clarke, Pailton, Rugby.

**Camera, etc.**—Quarter pocket camera and best oil lantern, 4-in. condensers; exchange Diamond camera and half-plate set.—William M'Culloch, Newtownards.

Half-plate camera, long extension, and slides, no lens nor tripod; full particulars.—Cain, 1, Wellington Street, Millom.

Half-plate modern camera, three slides; send particulars and price.—Wills, 21, Wordsworth Street, Cardiff.

**Cameras, Lenses, etc.**—12 by 10 camera, lenses, tripod; exchange 18 ct. lever, silver spoons.—1, Gurdon Place, Priory Street, Colchester.

Whole-plate camera by good maker, all movements, wide-angle lens with dishes, etc., complete; also first-rate quarter-plate camera, with three dark slides, by Watson, Beck, or other good maker, must be in first-class order. Send particulars and lowest price to—Charles Smyth, Lenagery, Co. Down.

Half-plate or larger camera, lens, dark-slides, etc., by best maker.—Spencer, Surveyor, Crawshaw-booth.

Wanted to purchase, second-hand cameras, lenses, and photographic sundries, for prompt cash. Immediate attention given to all correspondence.—Amateur Photographic Depot, 71, Oxford Street, Manchester.

**Dark Slides.**—Half-plate dark slide (wood) in exchange for No. 1 Demon and 350 stamps in album.—A. G. Mayes, 11, Comberton Terrace, Upper Clapton.

**Lantern Slides.**—To purchase second-hand lantern slides, also coloured slides of stones, etc. Good binomial and 12 by 10 R.R.—W. V. Morris, 34, Parade, Cork.

**Negatives.**—To amateur photographers. Wanted, some good negatives of views in the Isle of Man.—Address, giving particulars, No. 101, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

**Set.**—Camera set, Lancaster's half-plate Instantograph or hand-camera preferred; exchange only good silver watch, excellent timist, second-hand, cash value 25s., and a Quackenbush air-gun, almost new, cost 45s.—Mr. E., 344, Caledonian Road, London.

**Sundries.**—Photographic wheel box, must be in good condition.—H. Logan, 104a, Bridge Street, Burdett Road, Mile End.

**Tripod.**—Whole-plate tripod, sliding legs, Ashford or Optimus preferred, also Rubralux lamp.—E. Dringholme, Dringhouses, York.

[PRICE TWOPENCE.]

## OUR VIEWS.

"To hold as 'twere the mirror up to nature."—*Shakespeare.*

*Members of the Editing staff are "At Home" on Monday afternoons from Two till Five o'clock, and they will gladly give advice upon all photographic matters.]*

OUR first Monthly Lantern Slide Competition was very successful. No less than ninety-two slides entered for competition, each competitor being restricted to two slides. We were much gratified that at the exhibition of the slides at our offices on Monday evening—the first of the series—there was a very good attendance, so good, in fact, that at the next monthly show we shall arrange to give considerably more accommodation to the visitors, and hope to have a much larger attendance. The following are the awards:—

*First Prize (Silver Medal).*

EDGAR G. LEE .. .. Cullercoats,

the subjects being "Eventide" and "In the Hayfield," obtained by contact on Mawson plates, developed with pyro and ammonia. A good colour was secured by development.

*Second Prize (Bronze Medal).*

THOMAS GLAZEBROOK .. Ashton-under-Lyne.

The subjects were "The Cockle Gatherers" and "Playground of the Sea," the first by reduction and the second from a hand-camera negative, both on Fry's plates, developed with hydroquinone.

*Third Prize (Certificate).*

G. EDWARD WILSON .. .. Kidderminster.

The subjects were "The Haunt of the Kingfisher" and "In Dovedale," both by contact on Mawson plates, and developed with hydroquinone.

A full list of competitors, the titles of their slides, plate and developer used, will be found in the February number of the *Photographic Reporter*. The unsuccessful competitors' work is arranged in three classes. It should be quite understood that prize winners cannot enter again in competition for a prize of the same value as that awarded. For instance, Mr. Lee is now debarred from entering the AMATEUR PHOTOGRAPHER "Monthly Lantern Slide Competition," and Mr. Glazebrook can only compete for the Silver Medal, whilst both Silver and Bronze are open to Mr. Wilson, the winner of the Certificate. We hope that all prize winners in the "Monthly Competitions," as well as many others, will enter our 1891 Lantern Slide Competition.

WE have no intention of allowing any competitor to take more than one AMATEUR PHOTOGRAPHER Medal of the same

value, and we shall not, in future, place any of our Medals at the disposal of either photographic societies or exhibition committees. We have to complain that in several instances where Medals have been asked for and given, the Secretaries of the society or committee have not had the courtesy to send us advice as to the name and address of the prize winners. We intend to make the conditions attached to gaining the AMATEUR PHOTOGRAPHER Medals as stringent as possible, and so increase the honour attached to winning them.

We sincerely thank the readers of the AMATEUR PHOTOGRAPHER for the support they give to our competitions, and are especially pleased to find that our efforts are so highly appreciated.

The "Monthly Lantern Slide Competitions" may be had on loan. A packing fee of *one shilling* to be forwarded with each application. This fee also has to be paid for the loan of the "Monthly Competition Prints."

A CORRESPONDENT writes that Ashton-under-Lyne could well support a photographic society. We shall be glad to hear from others who are of the same opinion, although we should have thought one or other of the very excellent societies in the neighbouring towns would supply all the requirements of Ashton. The continued multiplication of photographic societies is not an unmixed blessing—better a great deal two large societies than six small ones; at least, such is our opinion.

THE Sydenham Amateur Camera Club, the members of which have until recently met at each other's houses, have taken up quarters at the "Greyhound," Sydenham. Mr. H. H. Gray, Hon. Secretary of the Club, 9, Thicket Road, Anerley, S.E., will be glad to hear from gentlemen who may be disposed to join the Club. We do not often fall out with the word "amateur," but when it is used as a prefix to either a camera or a club it seems out of place, as in the case of the Sydenham Amateur Camera Club.

OUR readers, we feel sure, do not quite understand the advantages of the "Lantern Slide Exchange" column. They only require to be known to be appreciated. In that column we allow our readers to advertise the slides they are willing to exchange, *free of charge*. By this means sets will be easily made up, and much help given to amateur photographers all over the world. We shall probably offer the same opportunities for the exchange of negatives,

and shall be glad to have the views of our readers upon the matter.

WE very much regret to hear that Mr. John A. Hodges is compelled, owing to ill-health, to give up his position as Hon. Secretary of the West London Photographic Society. The Society not only owes its present prosperity mainly to the exertions of Mr. Hodges, but its very existence is due to his spirited action. The starting of the Society is now a matter of history, and those who are wishful to know how Mr. Hodges worked, will find it recorded in the back numbers of the AMATEUR PHOTOGRAPHER. We hope that if Mr. Hodges has more leisure he will have better health, and, at least, that he will have some time to devote to the practice of photography, in which he has at present gained considerable distinction. We should perhaps add that Mr. H. Selby, of 42, Ladbroke Grove Road, Bayswater, W., will take up the work of Hon. Secretary to the West London Photographic Society, and that his brother, Mr. L. Selby, will assist him.

THE Louth and District Photographic Society have considerably increased their membership, mainly through the holding of a *free* photographic exhibition, at which the AMATEUR PHOTOGRAPHER Monthly Competition photographs and the 1890 Prize Slides formed part of the show. Beginners' classes have been started and demonstrations are given at frequent intervals.

THE 1890 Prize Slides are, to use a rather expressive term, "waltzing about" the kingdom, giving pleasure wherever they are shown. Were we to publish an account of all the kind things that are said about them, and reprint the appreciative notices that have appeared, we should be obliged to set aside a column every week. Although the 1890 slides are good, we are quite satisfied that the next competition will far surpass them. We hope very shortly to publish rules, conditions, etc.

WE note that at the Friday evening meeting of the Royal Institution, on the 23rd inst., Mr. Alfred Watkins exhibited his Exposure Meter (with examples of its application); Messrs. Green, Cross, and Bevan their Diazotype printing process; and Mr. J. R. Gotz his new camera. Lord Rayleigh was to have given a lecture on "Some Applications of Photography," but was unable to attend.

THE paper read at the meeting of the Society of Arts last week was of some interest, as suggesting a field for experiment and investigation in the direction of photography in colours. The subject of the paper, which was read, with a demonstration, by Messrs. Green, Cross, and Bevan, dealt with the new process of Diazotype, which may be briefly described as follows: The process consists of three stages: (1) Drying or coating the surface upon which it is required to photograph with a particular compound (primuline), which is then (2) converted into a photo-sensitive derivative (by treatment with nitrate of soda), and (3) exposed to the light under the usual conditions for giving the picture; (4) converting the sensitive compound wherever it survives, through having been protected by the shadows of the object photographed, into colouring matters (by the use of preparations of aniline colours), and thus the picture is developed from the weakly-coloured sensitive compound into well-marked shades of red, orange, brown, purple, or blue; and these shades being formed in stable colouring matters, the picture is at the same time fixed. The process can be

used on velvet, silk, linen, and other fabrics, and very beautiful results, even in figure studies, were shown.

A LIVERPOOL contemporary publishes the following practical joke, which was recently played on a well-known amateur:—

A few days ago Mr. J. T. Ellerbeck, of Liverpool, who is well known as a very able photographer, received a post-card from the Land of the Midnight Sun, addressed—

*Great Photographer of  
Norwegian Scenery, etc.,  
Residing in Liverpool.*

Mr. Ellerbeck has for a number of years gone annually to Norway to photograph the magnificent scenery there, and in the Scandinavian country is known far and wide. Mr. Paul Lange is also well known to be a very able photographer, and he, too, has photographed Norway, though not to the extent that Mr. Ellerbeck has. However, a mutual friend of the two gentlemen, seeing an announcement in the daily papers of the "Great Photographer" post-card, thought he'd play a joke, so he perpetrated the following envelope and posted it:—

*To the Greater Photographer of  
Norwegian Scenery in Liverpool,  
Paul Lange, Esq.,  
Dods' Buildings,  
Liverpool.*

And now Mr. Paul Lange and Mr. J. T. Ellerbeck are hunting that jokist down with shot guns and grappling irons.

#### "EXIT EMERSON."

IT has always been the opinion of many thoughtful workers that the doctrine of "fuzziness," particularly in the heyday of its influence, operated as a kind of *ignis fatuus* to the earnest student of pure photography. That an art which is especially and peculiarly adapted to the portrayal of nature with minute precision and brilliant definition should seek as its highest manifestation the representation of vague suggestions, was felt to be a glaring anachronism; it was so violently out of keeping with the obvious genius of the art. Yet many have, possibly in the main through the persistent teachings of Dr. Emerson, adopted the above heresy; not the least offender being, in our opinion, the Photographic Society of Great Britain, which, at the last Pall Mall Exhibition, stamped with its approval a number of works characterised by blur and mist.

The photographic world now learns with considerable surprise that Dr. Emerson has, to use his own words, made a dust-heap of his well known volume entitled "Naturalistic Photography," and has renounced all his previous peculiar views. Much as he has, in our opinion, hindered the progress of photography by his now recanted teachings, he has still more injured it by the bitter and desponding words which he has included in his renunciation.

In the past he compared "photographs to great works of art, and photographers to great artists." Now, overcome by the Giant Despair, he can hardly think too little of art photography.

After this *bouleversement* we are not surprised to read that he derides the rules of composition, nor that he considers "the eternal principles of art . . . mere catch-words." These opinions should convince Ruskin and his like that they lag superfluous upon the stage of life. Dr. Emerson proceeds as follows:—"It may be asked, then, what theories on art I have? I answer, at present *none*. . . What do I think of writings on art and art criticisms? Mistakes."

We are greatly inclined to agree with him in this last: that is, as far as he is personally concerned, if he really has no theory on art left to him. Such being, according to his own words, the case, why should he so ruthlessly endeavour

to smother the hopes of other students by a hailstorm of assertion which, if undissipated, would relegate photography to the perdition of a sham art?

Is there a fly in the ointment, or has Dr. Emerson nothing to interpret his thoughts with but acids and bitters? Whichever may be the case, he has tired of searching for Dame Nature in an artificial fog, and now writes this petulant jeremiad. What he in so many words says is this, "I, even I, have failed; therefore, ye little fishes, there is no hope for you; how can a tadpole succeed where a mighty leviathan has suffered inglorious defeat?"

Thus from the mountain of optimism has he fallen into the pit of pessimism, and there with all kindness we must leave him in a species of dark purgatory until such time as he is once more able to ascend to the light of day, and has become fit to re-enter the paradise of photography! We do not by any means "rub our hands with small-souled glee," but have read this melancholy confession of weakness more in sorrow, more in pity than in anger, and not at all in joy.

Before concluding, we must regret that Dr. Emerson has not seen fit to notify his change of views more gracefully than he has chosen to. Why this needless dealing out of thunderbolts? What boots it who initiated the naturalistic cult when the man who claims to be "sole inventor" declares it to be worthless? To squabble over what is declared to be valueless is surely "much ado about nothing." An epitaph with which Dr. Emerson is credited describes "Naturalistic Photography" as dying with "a gibe on its lips," a most undignified and unmannerly way of giving up the ghost. To us it seems that its end is distinguished by the sting in its tail, a sting which, like the last effort of an expiring ephemera, it seems to thrust into the body of the amateur. Fortunately for the cause of art-photography, its future does not, nor ever did, depend upon the teachings of Dr. Emerson or any other individual. Just as he has failed to elevate an eccentricity into the position of a photographic dogma, so now his *ipse dixit* will fail to persuade us and others that photography is only a lowly handmaiden of art, a kind of scullion wench merely fit to clean pots and pans for the painter of pictures.

Let us all not forget that art-photography is still in its teens; let us remember that within the past few years it has made great strides; let us hope and believe that it is destined to advance in the near future as much as it has in the past. How far this advance will be maintained it is hard to prophesy, but anyhow we may all confidently expect that art-photography will travel along the road which leads to the temple of art, a long, long distance beyond the spot where Dr. Emerson has lost heart and fallen by the way.

#### ROUND THE WORLD WITH A CAMERA.

On Thursday, January 22nd, a lantern exhibition on a really gigantic scale was held at the International Hall, Piccadilly Circus, on behalf of the Liberty Library. Mr. Liberty, of the well-known Regent Street firm, having been introduced in a few well-chosen words from the Chairman, proceeded to deliver a most able, interesting, and amusing account of a trip round the world which he had taken in company with Mrs. Liberty during the course of the year 1889. He began his remarks by saying that it was owing to the photographic energy of Mrs. Liberty that he was enabled to show them so many slides, and dwelt upon the additional interest that is lent to such a tour as theirs by the presence and frequent use of what he chose to term a "scientific toy." In addition to the whole-plate camera, they carried a Kodak, and a few of the slides shown on the fifteen-feet screen were from Kodak negatives and illustrated the work of that truly "scientific toy." Some 150

slides in all were passed through the lantern, beginning with Egypt and the Suez Canal, passing on to Ceylon, then to the Straits Settlements and China. Unfortunately, almost the whole set of the Chinese negatives were spoilt, the glass ones being smashed to pieces by being packed in grooved boxes (tourists, beware!), and the films (Eastman strippers) being spoilt by a terrible epidemic of damp spots; the few, however, that were saved were of particular interest. Passing on to Japan, an admirable series of pictures appeared on the screen, Nagasaki, Tokio, besides some of the less frequented parts of the country, being freely illustrated. At Nagasaki Mr. Liberty went to a native photographer, Jens by name, to have some of the plates developed, and was kept so long waiting while they were being finished off that he very nearly missed his steamer; an account of his adventures on this occasion being most graphically given. Some of the pictures of a few out of the 13,000 temples of Tokio were first rate, and the street scenes, flower studies, and genre groups brought the characteristics of Japan vividly before the audience, and did Mrs. Liberty great credit as a photographer.

There seems to be no difficulty met with in photographing in Japan, the priests even being quite agreeable, and offering no obstacle to the photographing of their temples. More trouble is experienced in China, especially away from the forts, for in the interior every foreigner is scowled at and called a foreign devil. Some of Mrs. Liberty's pictures of Japanese gods, too, were most interesting, that of the Rheumatism God and the Japanese Venus weighing 450 tons, being quite unique and executed with much technical skill. Passing on across the Pacific, the audience were introduced to the magnificent natural scenery of Western America and the Yosemite Valley, Mrs. Liberty's rendering of the marvellous Mirror Lake in the latter district being specially notable. The last slide shown was one of the statue of Liberty in New York Harbour, *apropos* of which Mr. Liberty made some admirable remarks on the subject of freedom generally, as conceived by our American cousins and ourselves, and drew attention to the fact that the statue points across the Atlantic to the shores of Great Britain—the true home of freedom. The series of slides shown forms but a small portion of the whole set of photographs executed by Mrs. Liberty, and, considering that she had very little acquaintance with photography before starting, it speaks volumes for her skill and energy that she should have been able to bring back so excellent a collection. Most of the scenes were very well chosen, and showed considerable artistic capacity; in some instances Mrs. Liberty introducing the camera where a more experienced worker would, perhaps, have feared to venture.

Mr. Liberty's remarks and explanations fully supplemented the pictures, and to say that he kept an audience of about 1,000 people intensely interested for two and a half hours is a sufficient tribute to his powers as a lecturer. The meeting terminated with the usual vote of thanks.

The whole entertainment shows how much pleasure may be given to others by an intelligent use of the camera, supplemented by the optical lantern, and serves to illustrate the fact that of all hobbies that of photography is the most unselfish, and, besides being a scientific pursuit, can be made the means of affording a vast amount of pleasure to others.

**International Annual of "Anthony's Photographic Bulletin."**—The fourth volume is in active preparation, and will be published early in May. The English editor is Mr. W. Jerome Harrison, of 365, Lodge Road, Birmingham. Some of the best workers in both hemispheres have already promised contributions, and there will be about twenty high-class illustrations.

## Composition, and Light and Shade.

*Selected and arranged for the use of Photographers, from "Burnet's Essays," with Introduction and Notes.*

By H. P. ROBINSON.

### CHAPTER III.

*Fig. 1.* In commencing a composition, it is customary to mark the middle of the space, for the purpose of arranging those points we consider of most importance to the subject; dividing the picture for the regulation of the masses of light and shade, of ascertaining and fixing the horizontal line, etc. This mode of constructing the composition is often suggested from the perspective effect requiring a length of line, thereby obliging us to place the point of sight at one side of the picture: sometimes from the group requiring a large space; which a diagonal line secures, as in the elevation of the Cross by Rubens, or from the conduct of the light, as in his picture of the Descent from the Cross, etc.

Cuyp (fig. 1), in adopting this mode of composition in most of his pictures (which are generally Sunset or Sunrise), places the focus of light at the bottom

FIG. 1.

FIG. 2.—CUYP.

the pictures of Cuyp, Rubens, and Teniers, where the figures, landscape, and sky are all on the same side of the composition, that a rich and soft effect is produced; the strong light and dark touches of the figures telling with great force against a background of houses, trees, etc., which are prevented from being harsh and cutting, by mixing their edges with the clouds, or dark blue of the sky. This doubling of the lines (if I may so express it) gives a picture that rich fulness which we often perceive in a first sketch, from its possessing several outlines.

Those who imagine, that, by thus throwing the whole composition on one side, a want of union will be produced, will be convinced of their error by perceiving how small an object restores the balance (fig. 2); since, by its being detached and opposed to the most distant part, it receives a tenfold consequence.

*Figs. 3 and 4.* In these compositions Potter has made use of the sky as a background, by which mode the high lights of his ground have more value, and it is rendered less harsh and cutting; which is the case with his famous picture of the Bull,

the figures in which are brought up against the light side of the sky. If deception and strong relief were all he aimed at, he has gained them both, though

FIG. 3.—P. POTTER.

of the sky, thereby enabling the distant part of the landscape to melt into it by the most natural means; while the strongest part of his sky, being at the opposite angle, produces the greatest expanse, and mixes and harmonises with the dark side of the picture. Thus the eye is carried round the composition, until the two extremes are brought in contact, the most prominent with the most retiring.

In compositions constructed on this principle (particularly where the landscape occupies a large portion), many artists carry the lines of the clouds in contrary direction, to counteract the appearance of all the lines running to one point. Thus using the darks of the cloud, etc., to *antagonize*, as it is termed, may apparently produce a better equipoise, but sacrifices many advantages; for we observe in many of

at the expense of some of the higher qualities of the art, "a melting and union," as Reynolds terms it, of the figures with the background. The art is now too far advanced to allow us to be gratified with violent contrast; and a *small portion* of the group coming firm off the ground, is found to be sufficient to give the appearance of natural solidity to the whole.

FIG. 4.—P. POTTER.

In figures 2, 3, 4 are given illustrations of balance, a principle which will be found running through all good composition. In 2 and 4 the diagonal forms are balanced by dark objects coming before and opposing the greatest distance. It is only necessary to imagine the boat in fig. 2, and the cow

in fig. 4, absent, to see at once the great value of these balancing spots to the composition. In fig. 3 balance is

obtained in a different manner. Here we find the line of the tree opposing the diagonal, and the white cows are relieved against a dark sky just as the dark spots in the two other illustrations are relieved by the light sky and distance. The most eminent landscape painters have used this form of composition with its numberless varieties, and it will be found of the utmost value to the photographer. Many painters have found it possible to give what may be called an endless variety to sameness by their performances on this keynote. Turner's pictures may be studied with advantage for illustrations of balance, and the use of a small portion of strong dark or light, primarily for balance, and then to give luminosity and atmosphere to other parts. This great landscape painter carried this principle out in all he did, even to the most insignificant sketch. For examples—in the "Fighting Téméraire," in the National Gallery, notice the extreme value of the dark buoy, and, as a variation, that small speck, the dog, in "Crossing the Brook." These are two of his great pictures. Now turn to any of his vignettes, such as those illustrating Rogers' Italy and Scott's poems, and notice how the great principle is carried out in the tiny engraving. It would be a good lesson to the student to walk through the National Gallery and examine the pictures for illustrations of the use of this principle of balance, and for nothing else at present. He will not find it in the earliest examples which followed more or less the Byzantine Convention, but it exists in all others. For the purposes of photography the Dutch and English schools would give the most profitable lessons, especially, as I have said, the works of Turner. The budding artist who is inclined to "have nothing to do with the tyranny of rules" should remember that Turner was a very great and original genius, who might have been above and beyond all rules, and that, nevertheless, he obeyed them.

(To be continued.)

## Photographic Work for the Winter Months.

BY T. PERKINS, M.A.

### CHAPTER III.

#### INDOOR WORK—IMPROVEMENT OF NEGATIVES.

THERE are many days in winter when fog, or rain, or deep snow prevents the photographer from doing any work out of doors, or making his way about the country in search of interiors, days when the fireside is the most comfortable place, when, at any rate, such work as can be done at home is the only kind possible. But the very fact that we do not care to go beyond the front door, save when compelled to do so and have plenty of time on our hands, gives us the opportunity of doing some photographic work carefully which we might be inclined to hurry over in the summer.

First comes the improvement of negatives taken during the summer; proofs have probably been already printed, and no doubt in some cases have revealed the fact that better prints might be obtained from the negatives if the latter were subjected to some manipulation. It often happens when we have had a long tramp on a dusty day, or when the plates in their backs have been well shaken on a railway or cycle journey, that dust has made its way to the surface of the plate, however carefully the plate and slide were dusted in the dark-room just before setting out, and multitudes of tiny transparent spots show themselves on the developed plate wherever the little specks of dust have shielded the film from the light passing through the lens during the exposure. Now these will, of course, print dark, and if of any size will completely spoil the print. One thing may be noticed here, namely, that these transparent spots are not always so large as they seem when the negative is held up to the light, for, owing to the phenomenon

called irradiation, bright objects on a dark ground look larger, and dark objects on a bright ground look smaller than they really are, so that some of the smaller dust spots occurring in a bright part of the picture will, when printed, be invisible, unless the picture is carefully examined at close quarters. Hence, we need not trouble ourselves about these, but the rest must be spotted out. And a most tedious process spotting is; every hole must be attended to by itself. I find a small well-pointed brush of red sable, which is stiffer than brown sable or camel hair, charged with a little water colour is the most useful instrument for getting rid of these annoying spots. Care must be taken not to have the colour too liquid, or it will, when dry, set in the form of a tiny ring with a semi-transparent centre; the colour should be just moist enough to allow the brush to work freely. We should choose our colour to match that of the negative as nearly as possible. Many persons would naturally choose a dense, non-actinic colour like vermilion, and rightly so if the spot occurs in a part of the picture which prints absolutely white, but in most cases it will be best to allow a little light to pass through the paint, hence some neutral tint, Payne's grey, or a mixture of a transparent blue with sepia or some other brown, will be found most useful. These colours will also be found useful when it is necessary, as it sometimes is, to block out a defect of considerable size. This may often be done with advantage on the back of a plate. For spotting, the most convenient way is to use a retouching desk, but a very good substitute may be made by blocking up a window-pane with a sheet of brown paper which has an aperture in the middle smaller than the negative; in front of this opening the different parts of the negative which require spotting may be successively held and pressed firmly. Oiled paper or thin tracing paper may sometimes be used to correct defects in negatives. I am not now speaking of using this as a dodge to heighten effects, for about the legitimacy of this I have serious doubts, but simply to get rid of mechanical defects caused either by faulty films or accidents during or after development. Of course, no one ought to fail to make his developer flow uniformly over the whole plate, but such accidents will sometimes occur, especially when a plate is developed away from home in an awkward or insufficiently lighted dark-room. If a portion of the plate is not wetted with the developer at first, the rest of the plate gets a start, and although the mistake may be soon found out, the patch will have less density than the rest of the plate; a little piece of thin paper stuck on the back of the negative, and afterwards oiled if necessary, will often completely equalize the density so that the print does not show the defect. A little working with a black lead pencil on the surface of the film will sometimes be useful in softening a line caused by the developer not flowing freely all over the plate at first.

The next improvement in negatives to be considered is local reduction. When photographing landscapes I always prefer to get the clouds present at the time of exposure shown on the print, rather than to print them in from cloud negatives, which as a rule introduce falsity into the print; but it is often impossible to retain these, they show beautifully in the earlier stages of development, but become blocked up before development is complete, but they may nearly always be recovered by the judicious use of a reducer carefully applied by means of a brush after the negative is dry. The same process is often needful in the case of windows in interiors. For such work I prefer to use films of celluloid instead of glass plates. Halation, properly so called, ought not theoretically to make its appearance when these films are used, but I have many times met with appearances closely resembling halation. I am inclined to attribute these to floating dust or mist inside the building,

lit up by the light streaming in through the windows. In a negative of St. Mary's Church, Leicester, taken last summer, this effect is curiously shown. The chancel was well lit, but across the windows ran the screen dividing the nave from the chancel; this in the negative and print is clearly defined; not the slightest phenomenon resembling halation is seen here, but close up to the screen on either side of the windows there is an appearance of fog, due, I believe, to floating dust lit by light pouring in from the bright east windows. The tracery had disappeared, but an application of the reducer enabled it to be seen in the negative, so that it printed on the paper. And altogether, apart from halation, it stands to reason that a window for which an exposure of a few seconds would suffice must be enormously over-exposed when the exposure of fifteen or twenty minutes needed for the rest of the picture is given, so that the windows are often blocked up by the time the development is finished, and reduction will be necessary in order to get detail into them.

Some negatives will be improved by general intensification or general reduction. As a rule, if I have any doubt while developing about the intensity of the negative, I prefer to err rather on the side of over-density than under-density, as I can make more sure of reaching the desired density by reduction than by intensification.

Another defect, and one that greatly offends the eye, which we meet with is the distortion caused by tilting the camera, shown by vertical lines converging, generally towards the upper part of the picture. This may be due to sheer carelessness in not accurately levelling the camera when taking the original negative, or to the necessity of taking the picture in a hurry to secure some special feature, or to a hand-camera not furnished with a level being used, or again one may deliberately tilt the camera without using the swing-back to secure sharpness without the use of a small stop, when it would be impossible to give the exposure that would be required with a small stop, knowing well at the time that the distortion so caused can be cured in a manner to be described, whereas want of sharpness introduced by the use of the swing-back cannot be cured. When the distortion is thus purposely introduced, the angle the back of the camera makes with the vertical should be measured at the time of exposure, and should be entered in the note-book. We must then, at our leisure, make a corrected transparency from the distorted negative. It is easy enough to get the vertical lines parallel, either by inclining the negative to the axis of the lens of the copying camera, keeping the transparency plate perpendicular to the axis, or by keeping the negative perpendicular to the axis of the lens and inclining the transparency plate; but in either case the correct proportion of width to height will be destroyed—in the former case the height will be diminished in proportion to the width, in the latter it will be increased—but the correct proportion will be secured if the two methods are combined, and the negative and transparency plate are equally inclined in opposite directions to the axis of the lens of the copying camera. I have found that the following method will give a result sufficiently accurate for most purposes. Suppose that the camera had been tilted upwards when taking the original negative, then place the negative upside down in front of the copying lens, and swing the top of the plate so placed backwards through an angle equal to about three-quarters of the angle which the camera back, when the negative was taken, made with the vertical. Then swing the back of the copying camera in the opposite direction through the same angle. In practice it will be well to have a series of parallel straight lines ruled on the focussing screen of the copying camera, and then to swing the back, if necessary, a little on one

side or other of the position above described, so that the vertical lines of the image on the screen coincide or are parallel to the lines ruled on the screen. It will be then found that the want of parallelism in the vertical lines will be got rid of, while the correct proportion between width and height will be secured. In those cases where the tilting was accidental and its amount was not measured, the requisite amount of swing when making the transparency must be found by trial. It will be seen that an exceedingly small stop need not be used in copying, as the image of that part of the negative which is farthest from the lens will be formed on that part of the transparency plate which is nearest to the lens, hence with a moderate sized stop, all will be in correct focus together. Having secured a transparency free from distortion, it remains, either by contact printing by artificial light or by copying in the camera by daylight, to make a negative from which prints may be made by any method of printing which may be desired. I have now shown how the best may be made of any negatives in our possession, and in the next chapter I shall give a few hints on the way in which during the dull days of winter positive prints, lantern slides, and enlargements may be made from them.

## Chemistry for Photographers.

By C. H. BOTHAMLEY, F.I.C., F.C.S.

(Continued from page 43.)

ONE of the most remarkable properties of water is its great solvent power, and, as a consequence, natural water is always more or less impure, and perfectly pure water can only be obtained with great difficulty, even in a laboratory. The water occurring in nature may be classed under various heads.

*Rain water*, resulting from the condensation of the aqueous vapour in the atmosphere, is the purest form of natural water, but even it contains certain substances which it has dissolved on its way through the air. In the country it contains practically nothing but small quantities of the gases dissolved from the atmosphere; near the sea it contains in addition small quantities of the sea-salts which are always present in the air of such localities; in towns it contains acid vapours as well as the ordinary atmospheric gases, and particles of soot, dust, etc.

*River water* consists largely of surface drainage—i.e., rain water that has run over the surface of the land without sinking into the soil—with a proportion of spring water, varying according to local conditions. It contains the same substances that are found in spring water, but in lower proportion, owing to the dilution and surface drainage, the more prominent constituents being determined by the nature of the rocks through which the river flows. If the bed of the river consists of hard granitic rocks, the proportion of dissolved matter will be very low, but if the bed consists of chalk, marl, etc., it will be high. In addition to the dissolved matter, river water always contains insoluble suspended matter in the shape of mud, sand, etc., the quantity being very small in some cases and very large in others, especially when the river is rapid and its bed is soft.

*Spring water* is rain water that has passed through the soil and rocks, accumulated in underground caverns and fissures, and finally come to the surface along natural cracks or through a porous rock such as sandstone. On its way through the soil and rocks, the water has dissolved some of the substances which they contain. It is found that all spring waters contain pretty much the same substances, though their absolute quantity and relative proportions vary greatly in different cases. They are the carbonates,

sulphates, chlorides, and silicates of calcium, magnesium, sodium, potassium, and iron. In a limestone or chalk district the proportion of calcium carbonate is high; in a marl district the proportion of sodium chloride and calcium sulphate is high; in a magnesian limestone district magnesium carbonate will be present in considerable quantity; if there is a bed of salt in the neighbourhood, the water will probably contain a high proportion of salt. The total quantity of solid matter in a spring water varies in different localities from two or three grains per gallon (3 to 5 parts in 100,000) to 50 or 60 grains per gallon (70 to 90 parts in 100,000).

When a spring water contains so much dissolved matter that it has a distinct taste, it is called a *mineral water*, and in some of the strongest mineral waters the total quantity of solid matter is more than 1,000 grains per gallon (1,400 parts per 100,000). They are classified, not according to the constituent which they contain in greatest quantity, but according to one which gives them a special character. The chief groups are *alkaline waters*, containing sodium carbonate; *sulphur waters*, containing hydrogen sulphide ( $\text{SH}_2$ ), or sodium hydrosulphide ( $\text{NaSH}$ ), or both; and *chalybeate* or *ferruginous waters*, containing iron carbonate ( $\text{FeCO}_3$ ).

Well water has the same composition and properties as spring water. The water supplied to many large towns, especially in the north, is upland surface water, *i.e.*, rain water that has run over the surface of the moors and uplands, and has been collected and stored in large reservoirs. It usually contains a comparatively low proportion of dissolved matter.

The suitability of a water for drinking purposes does not depend so much upon the total quantity of solid matter that it contains (though it is desirable that this should not be high), but upon the presence or absence of poisonous metals, such as lead, and especially upon freedom from contamination with sewage and decaying animal or vegetable matter. It is established that the presence of animal matter or sewage in a drinking water may give rise to illness of the most serious kind, and it is essential that the greatest care should be taken to prevent such contamination. Access of sewer gas to water stored in a cistern may produce very serious results. River water is unsafe, unless taken at a considerable distance from a town or village, and water from shallow wells is also often dangerous, especially if the well is sunk through porous rock, owing to the possibility of the percolation of liquid sewage, etc., through the rock into the well.

The suitability of a water for technical purposes depends chiefly on the quantity and nature of the dissolved solid matter. If the proportion is high, and especially if compounds of magnesium and calcium are present in large quantity, the use of the water for many purposes is attended with considerable difficulties.

Water containing compounds of calcium and magnesium is "hard," *i.e.*, will not dissolve soap and make a lather, but decomposes the soap and forms a curdy insoluble precipitate. Soap is a compound of a fatty acid (oleic or stearic) with sodium (hard soap) or potassium (soft soap), and when the soap comes in contact with a calcium or magnesium salt the fatty acid of the soap combines with the calcium or magnesium to form an insoluble compound, whilst the sodium or potassium of the soap combines with the acid previously united to the calcium or magnesium, thus—

Sodium oleate + calcium sulphate = calcium oleate + sodium sulphate.

Potassium stearate + magnesium carbonate = magnesium stearate + potassium carbonate.

Some hard waters when boiled deposit calcium or magnesium carbonate, or both, and become softer. Hardness

that can be removed in this way is called "temporary hardness." Other hard waters are not affected by mere boiling, and are said to be "permanently hard," the hardness being due to the presence of calcium or magnesium chlorides or sulphates which are kept in solution simply by the solvent action of the water.

Temporary hardness is due to magnesium or calcium carbonate or both. These compounds are dissolved by pure water to a very slight extent only, but when the water contains carbon dioxide, as is commonly the case, it can dissolve much larger quantities of the two carbonates. If now the water is heated, the carbon dioxide is expelled, and consequently the calcium or magnesium carbonate is precipitated. A similar result follows if the carbon dioxide is neutralised by lime or any other base, and upon this fact is based Clark's process of softening waters, which is applicable only to temporarily hard waters. Lime-water, containing in solution calcium hydroxide  $\text{Ca(OH)}_2$ , is added to the hard water in quantity sufficient to combine with all the carbon dioxide. Calcium carbonate is thus formed and is precipitated, and at the same time the carbonate or carbonates kept in solution by the carbon dioxide are also precipitated. The general equation representing the change is as follows—

In the water.

Precipitated.

The process is readily applied on either a large or a small scale. It is not applicable to waters containing chlorides and sulphates of calcium and magnesium. In these cases, however, the greater part of the calcium or magnesium can be removed by mixing the water in a tank with the proper quantity of soda-ash (sodium carbonate), allowing the precipitate to settle and drawing off the clear water. The calcium or magnesium is precipitated as carbonate, an equivalent quantity of sodium chloride or sulphate being left in solution, but for many purposes the presence of these salts is of no importance, or, at any rate, is much less injurious than the presence of the calcium and magnesium compounds. The reaction is represented by the equation—

Precipitate.

In solution.

Precipitate.

In solution.

where X stands for the acid originally combined with the calcium or magnesium.

(To be continued.)

## Photo-Micrography.—III.

BY ANDREW PRINGLE.

### OPTICAL APPARATUS—OBJECTIVES, OCULARS, CONDENSERS, BULL'S EYES.

THE choice of objectives is a very important matter for photo-micrography. The first essential is that the objectives be so constructed that the visual and actinic rays come to a focus on the same plane; in other words, that the lenses be "corrected for photography;" otherwise, however sharp we may see the images on our focussing screen, we shall not find it sharp on our negative. All opticians of repute now make objectives properly corrected in this respect.

It is necessary to know the exact magnifying power of

our objectives, if we wish to know with scientific accuracy the amount of our magnification. Objectives are called "one-inch," "half-inch," "one-twelfth," etc., from comparison with supposititious "single" lenses, and as a rule the focal length of objectives is quoted nearly accurately, but seldom quite accurately. A one-inch "O.G." (object-glass) will project an image such that at ten inches from the posterior conjugate focus of the objective, the projected image has a linear magnification of ten times the original object; a half-inch at the same distance will give twenty diameters of magnification, and so on. The image projected by an O. G. alone is invisible to the unaided eye, and at the same point behind the objective—the distance being determined by computation of the normal view-point of the human eye—we place an ocular, which not only renders the image visible, but further magnifies it. Sometimes this distance of normal vision is taken as ten inches, sometimes as about seven, so we have "long" and "short tube-lengths," 160 millimetres being the accepted Continental tube length, 250 mm. being a length often adopted in Britain. Of course, the longer the tube, with given O.G. and ocular, the greater the magnification, and the farther the ground-glass of the camera is from the O.G. (with or without an ocular), the greater also the magnification.

"Definition" and "resolution" depend, *ceteris paribus*, on "angular aperture," or "numerical aperture" (N.A.) of the objective. For explanatory purposes, definition is usually defined as "sharpness of image," and resolution as the power of *separating visually very close markings*; but evidently the two qualities are one and the same, for without definition a glass cannot separate details. Resolution, then, increases directly as numerical aperture, and this is a matter not of opinion, but of mathematics. Again, N.A. will enable a glass to resolve a given number of lines-to-the-inch with rays from a given part of the spectrum, and a theoretically correct table of these data will be found in every number of the *Royal Microscopical Journal*. Clearly, then, perfection of objective is to be looked for in larger numerical aperture or "angle." (It seems unnecessary here to discuss the meaning of, and the reasons that led to, the term "numerical aperture;" suffice it to say, that Abbé introduced the term in order to more accurately compare the apertures of "immersion" and "dry" objectives. A dry objective has a limit of 180 degrees of "angle," but immersion, while it cannot, of course, introduce any greater "angle" than 180 degrees, causes more pencils of light to be included in that angle, N.A. 1 = 180 degrees). But, in the first place, there is a limit of aperture beyond which the optician cannot go with regard to a given focal length of objective without spoiling that objective for general purposes. Thus we cannot get a good one-inch O.G. with N.A. .60, simply because the optician has not yet learned to make such a glass. In the next place, increase of numerical aperture entails *ipso facto* loss of other qualities, the most notable of which is "penetration." This penetration corresponds exactly to what in photography we call "depth of focus," and both in microscopy and in photography the quality is a myth. It is completely impossible that any lens can focus equally sharply two planes at right angles to its optical axis. In plain photography for artistic purposes "biting" sharpness is not desirable, and the larger the picture the less desirable it is. In photo-micrography we have nothing to do with art, and we want the most biting sharpness we can get. In photography, it is argued that there can be laid down a certain limit of confusion-area beyond which we may or may not go. Whether this is right

or wrong, it does not touch *our* question; we must have no confusion area at all. Some microscopists argue that by keeping down aperture we get more *equality* of focus for different planes, and in a sense this is true. We get with low aperture less absolute sharpness on any plane, and so we have no real definition to contrast with fuzziness, and we are deceived into a belief of good general definition. But this is not the system I propose to recommend. My experience is that a lens giving the best definition on one given plane gives also the best definition on adjacent planes, when we come to examine the entire image critically.

Penetration decreases with aperture, but much more with *magnification*, and it is immaterial how the magnification is obtained. An idea has been abroad that by making a negative of, say,  $\times 100$  diameters, and enlarging in the camera to, say, 300 diameters, a result with more penetration will be got than by magnifying to 300 diameters direct with an object glass. This is erroneous both in theory and in practice. The falling off will be practically the same in both cases, and probably in other ways the direct magnification will be the better result. A low-power objective with wide aperture will yield better results, in the matter of penetration, than a higher power with less aperture; and, provided we can get, without over-strain of the objective, as much magnification as we require, we should use a low power with a wide aperture. The "initial power" of an objective I define as the magnification it gives ten inches behind its posterior conjugate focus, and I define as "straining" a lens the use of that lens at a magnification beyond ten times its initial power, no matter whether the strain is accomplished by eye-piecing, "amplifying," or stretch of camera. The best workers only can get a fairly good image at any beyond ten times the initial power of the lens. I never attempt such a stretch when I can help it. Thus  $\times 100$  is quite enough for any one inch O.G.;  $\times 800$  as much as I care to tax the powers of a one-eighth, and I much prefer  $\times 80$  and  $\times 700$  respectively.

The best objectives, both for photographic corrections and for low power and wide aperture combined, are made of new kinds of glass, and are known as apochromatic. They were originally designed by Abbé, and made by Zeiss. They are expensive, very much so, but for the very best results in the highest flights I think they are necessary. Some English opticians make very good apochromatic glasses. I have tried a few, and they were very good. My own objectives are nearly all Zeiss apochromatics, and run as follows, in millimetres of focal length:—70; 35; 24 (N.A. .30); 12 (N.A. .60); 6 (N.A. .95); 3 (N.A. 1.4); 2 (N.A. 1.3). The most useful are those of 70, 24, 12, and 3 mm.

But every reliance may be placed on many glasses made by English opticians, provided the glasses are made and warranted for photography. Powell and Lealand, Swift, Beck, Watson, all sell glasses which I know to be suitable for our work, and certain German firms, notably Reichert, Seibert, Leitz, and others, have agents for very good glasses, many of which I have used, at prices considerably lower than Zeiss'. I understand that Powell and Lealand are making some very fine glasses, but I have not seen them and the price will be high.

The beginner should get a microscopical friend to select object glasses, and they should be taken only on the understanding that they are corrected for photography. The following battery will be ample, in inches of focal length, the aperture being as wide as the purse will permit. 3, 1,  $\frac{1}{2}$ ,  $\frac{1}{4}$ ,  $\frac{1}{8}$ ,  $\frac{1}{16}$ . For bacteria Mr. Swift makes a  $\frac{1}{16}$  oil immersion of very good quality and moderate price. Glasses of  $\frac{1}{4}$  inch and higher powers should have a correction collar, which I shall explain later, but Zeiss apochromatics of

NOTE.—Mr. Pringle has kindly consented to answer any questions on photo-micrography. Letters should be addressed care of Editor.

3 mm. ( $\frac{1}{8}$  inch) and higher powers have not such a collar. This, also, will be treated later.

The substage condenser must suit the objective. To get the full use of an O.G. of N.A. 1, we require a condenser of N.A. 1 at least. I recommend an achromatic condenser of, say, 140 deg. for easier work (part to be removed on occasion); an achro. condenser of about N.A. 1, as one made by Zeiss (agent, C. Baker, 244, High Holborn); Powell and Lealand's best immersion condenser N.A. 1.4 (expensive), or a non-achromatic condenser usable as immersion or with part removed. But I may say that an object-glass acts very well as a condenser, nothing being needed but a fitting for it in the substage. All condensers should have an iris diaphragm, and various "stops" are sold with a condenser.

A bull's-eye will also be required, and I like the bull's-eye to be on a stand if it is not fitted specially to the photomicrographic apparatus, which is better still. A bull's-eye for general use may have a diameter of about 2 ins., and a focal length as short as obtainable with that diameter. An "achromatic" bull's-eye with short focal length is a very useful instrument.

As a rule the ordinary Huyghenian ocular supplied with a microscope is not adapted for really good work in our line. I recommend the use of either a projection ocular or none. More will have to be said later about oculars and bull's-eyes.

(To be continued.)

## A Renunciation.

DR. P. H. EMERSON has asked us to give publicity to the following:—

### TO ALL PHOTOGRAPHERS.

Loving Brethren that were, I salute you. I owe you one apology, oh! my friends, for in the earnestness of my heart I partly misled you. You, who stuck by me in storm and stress I shall never forget—if any of you, after this renunciation, seek advice, ask and you shall receive of my best. You, enemies, who will now rub your hands with small-souled glee, rub on, till it all ends in imaginary soft-soap. You, whom I have in mistaken zeal attacked, pray forgive and forget.

And now list, I, saner than ever, renounce and abjure all theories, teachings, and views on art written, and first promulgated by me in sundry works, articles, etc., and finally collected in a volume, entitled "Naturalistic Photography." I cast them upon the dust-heap.

I am for the present and future neither idealist, realistic, naturalist, nor impressionist—*photographic impressionist*,\* indeed!—as though all graphic artists were not impressionists, and as if the photographic process could give aught but transcripts more or less literal. Shall I forsooth explain this burning of books?

List, you who have ears to hear and eyes to see.

In the fulness of my heart I dreamed a dream. I thought art might be taught by writing. I was wrong, I confess. I, even I, "the lover of nature"—every one is that now—preached that all art that did not conform to "truth to nature" principle was bad; that was a fatal sermon to many. From this followed again the idea—mistaken alas!—that photography *pure* (not impure, on rough papers, touched up by clumsy hands) was an art surpassing all black and white methods. *Eheu!* That this was ever believed! However, I was sincere, enthusiastic, but mistaken, and I was and am no amateur. I have by the sweat of my brow learned, under a master, something of this thing they call art. Being no amateur, I have therefore left the Camera Club, the home of the "amateur." But, ye reasonable ones in photography—some of you are *that*, true and worthy sons of the goddess Science, who has little to do with the goddess Art—you will ask, and with right, Why this thyness? I respect you, true workers in science—ye Abneys, Dallmeyers, Hurters, Driffields, Vogels, Jones,

Harrisons, Bolas, Waterhouses, Eders, and others. I will tell you, for the vulgar mob of pseudo-scientists have done naught but prove their ignorance and show signs of the itch—the itch for publicity and venom.

To you, then, who seek an explanation for my conduct, art—as Whistler said—is *not* nature, is not necessarily the reproduction or translation of it; much, so very much, that is good art, some of the very best, is not nature at all, nor even based upon it—*vide* Donatello and Hokusai.

The limitations of photography are so great that, though the results may and sometimes do give a certain æsthetic pleasure, the medium must always rank the lowest of all sorts, *lower than* any graphic art, for the individuality of the artist is cramped; in short, it can scarcely show itself. Control of the picture is possible to a *slight* degree, by varied focussing, by varying the exposure (but this is working in the dark), by development, I doubt (I agree with Hurter and Driffield, after three and a half months' careful study of the subject), and, lastly, by a certain choice in printing methods.

But the all-vital powers of selection and rejection are *fatally* limited, bound in by fixed and narrow barriers. No differential analysis can be made, no subduing of parts, save by dodging—no emphasis, save by dodging—and that is not pure photography; impure photography is merely a confession of limitations. A friend once said to me, "I feel like taking nearly every photograph and analysing it." Compare a pen and ink drawing by Rico or Vierge, in Pennel's book. I thought once (Hurter and Driffield have taught me differently) that true values could be obtained and that values could be *altered at will* by development. They cannot; therefore, to talk of getting the values in any subject whatever as you wish, and of getting them true to nature, is to talk nonsense.

It is impossible, in most subjects, to alter your values *as you wish*, and to talk of such things now is mere emptiness and puffed-up humbug.

Some amateurs, following Colonel Noverre's *revival* of rough printing papers *last year* (1889), have thought that salvation lay in rough surfaces. Colonel Noverre's dust-heap was ransacked, and we have heard of a "new departure"—a newer "school," and all the bleat of the overweeningly vain "amateur."

If there can be no scientific basis for an art, as some have asserted, Meissonier can claim to be as artistic as Monet, and Monet as Meissonier. The sharp photographer can assert his artistic rights alongside of the veriest "blottist." So all opinions and writings upon art are as the crackling of thorns beneath the pot. In short, I throw my lot in with those who say that photography is a very limited art. I regret deeply that I have to come to this conclusion. Photography is first of all the *hand-maiden of art and science*. It has and will register new facts of light, form, and texture. Pure photography is a scientific method of drawing, and scientists should work on until a true and literal scientific transcript of nature can be made—this by orthochromatics, etc.

It will interest some to hear what I think of some points that have been vexed questions in a war I have, I regret to say, stirred up. Composition, as understood by Burnet and others, I hold to be fatality itself, though I can appreciate the attempts to meet the difficulties in this matter. The eternal principles of art I have heard so much of are mere catchwords.

*Sharpness versus Diffusion.*—If the work is for scientific purposes, work sharply; if for amusement, please yourself; if for business, do what will pay.

I have (I regret it deeply) compared photographs to great works of art, and photographers to great artists. It was rash and thoughtless, and my punishment is in having to acknowledge this now. Think of the marvellous dexterity of the man who with pencil, pen and ink, or paint and brush, produces a masterpiece, the drawing equal to that of the lens, the tones in harmony, the colour delicate and marvellously beautiful. Read Rood's "Chromatics" for a hint of the manifold difficulties surrounding this subject. Then think of the amateur photographer, who, if clever, can in a few weeks turn out good technical work.

It may be asked then what theories on art I have? I answer, at present *none*. What artists I admire? I answer, all good artists and all good art. To what school do I now belong? None. What do I think of writings upon art and art criticisms? *Mis-*

*kes.*  
A final word. Suggestions have been made that I get some of my ideas from a book called "Naturalistic Painting." I have a

\* "A term consecrate to Charlatans," and especially to photographic impostors, pickpockets, parasites, and vanity intoxicated amateurs.

letter in my possession from an artist, wherein is stated clearly and exactly that Mr. Bate\* had read a paper of mine on "Naturalistic Photography" before his first article appeared in the *Artist*. At the Society of Arts, the other day, a paper was read by Mr. Davison . . . . in which my *old* ideas were freely and impudently bandied about and no credit given me. It was whispered about by my enemies that this person had originated some of the ideas of "Naturalistic Photography." To enlighten the public, I append a quotation from his letter to me on this point. . . . . He is now welcome to my cast-off clothes if he likes—he or anybody else. It is with deep regret I do this thing, and it is only as a duty to myself. I justify myself by stating that I wrote privately to Mr. Davison, expostulating with him for freely appropriating my ideas, and telling him that if he did not give me full credit at the Society of Arts, I should publish a history of the matter. He never replied. He can publish my letter in full if he likes. This was Mr. Davison's reply to a letter I wrote to him and others, asking them if they minded me thanking them in public for their support. His reply is dated from the Camera Club, December 16th, 1889, *only a year ago*. It is, "I AM GLAD AND PROUD TO BE IDENTIFIED IN ANY WAY WITH NATURALISTIC PHOTOGRAPHY, BECAUSE I BELIEVE IN WHAT I UNDERSTAND IT MORE AND MORE CLEARLY IT BE, BUT I DOUBT VERY MUCH WHETHER ANYTHING I HAVE DONE DESERVES RECOGNITION."

I sent a copy of "Naturalistic Photography" some time ago for review to the Editor of the "Journal of the Society of Arts," and it got a bad notice. All the ideas offered the other night were thus offered to the Society *previously*. Lastly, a special speech, read from a paper by a friend of mine, especially pointing out how I had originated these ideas, was not reported as it was read, the printed report giving altogether a different impression from what the speaker said. Those who heard the original can refer to the speech, as reported in the "Journal of the Society of Arts"—not "Artists," as Mr. J. Pennel has aptly described it. This sort of treatment, which is nothing new to me, may excuse some of my bitterly written invectives.

Finally, some of my friends to whom I have recently privately communicated my renunciation have wished to know how it came about. Misgivings seized me after conversations with a great artist after the Paris Exhibition; these were strengthened by the appearance of certain recent researches in psychology, and Hurter and Driffield's papers; and, finally, the exhibition of Hokusai's work and a study of the National Gallery pictures after three and a half months' solitary study of nature in my houseboat did for me.

P.S.—Will every Secretary of every photographic society take four wafers and a sheet of black paper and hide for ever the words "To the Student" in "Pictures of East Anglian Life."

#### L'ENVOI.

Having taken some earnest photographers a little way into the Art world, I feel it my duty to say that, when I have *fully* reconsidered the limited art possibilities of photography and the general philosophy of art, I will write another book; in the meantime, let students avoid all spurious imitations.

#### EPITAPH.

In Memory of

NATURALISTIC PHOTOGRAPHY,

WHICH RAN A SHORT BUT ACTIVE LIFE,

UPSET MANY CONVENTIONS,

HELPED TO FURTHER MONOCHROME PHOTOGRAPHY TO THE

UTMOST OF ITS LIMITED ART BOUNDARIES,

STIRRED MEN TO THINK AND ACT FOR THEMSELVES,

PRODUCED MANY PRIGS AND BUBBLE REPUTATIONS,

EXPOSED THE IGNORANCE OF THE MULTITUDE,

BROUGHT OUT THE LOW MORALITY OF CERTAIN PERSONS IN THE PHOTOGRAPHIC WORLD,

BROKE DOWN THE PREJUDICE OF THE OUTSIDE PUBLIC

AGAINST PHOTOGRAPHY'S VERY SLENDER ART CLAIMS,

ENCOURAGED MANY AMATEURS TO BABLE AND MAKE THE WORDS

"ART," "TRUTH," AND "NATURE," STINK IN THE

NOSTRILS OF SERIOUS ARTISTS,

ENDING BY GIVING A FEW A BRUTAL SORT OF APPRECIATION OF ART,

AND DYING WHEN ITS

ALLOTTED TASK WAS DONE WITH A GIBE ON ITS LIPS,

\* This does not imply that Mr. Bate took any ideas from my paper; on the contrary, I feel sure that his ideas were his own, as were mine.

FOR THE "AMATEUR," THE "PLAGIARIST,"  
THE "PRATING TRUE-TO-NATURE MAN,"  
THE "IMPRESSIONIST," THE "NATURALIST," THE "IDEALIST,"  
AND THE HUMBUNG.

P. H. EMERSON.

NOTE.—In publishing Dr. Emerson's "Renunciation" we have deemed it desirable to omit a few lines the publication of which we consider would be injudicious.—Ed.  
AM: PHOT:

## Notes for Novices.

### ANGLE OF VIEW.

THE angle of view or amount of subject included on a plate with a given lens is one which rarely troubles the beginner. He is generally content to use a lens recommended by a friend, or one which he buys with his complete set. At the same time this is a matter which soon claims attention, and as progress is made, our novice finds he always gets too much in his picture, and even old hands have too often a failing in this respect, viz., a tendency to crowd as much as possible on the plate. Now the amount of subject included by the human eye is not more than 50 or 60 deg., and to use a lens which will include more than this, gives one an idea of a jamming or crowding together of the objects. A very convenient rule and table has been compiled by the Rev. Clarence E. Woodman, which is given in the "Dictionary of Photography" and many standard text-books. A convenient little table to note is the following: When the focal length of the lens and the longest side of the picture are equal, the angle included is 53 deg.; when the longest side of the picture is  $1\frac{1}{4}$  times the focal length, the angle included is 64 deg.; when the longest side is  $1\frac{1}{2}$  times the focal length, the angle is 74 deg.; when  $1\frac{3}{4}$ , the angle is 82 deg.; when twice, the angle is 90 deg.; when the longest side is  $\frac{3}{2}$  of the focal length, the angle is 41 deg.; when  $\frac{2}{3}$ , the angle is 36 deg.; when  $\frac{1}{2}$ , the angle is 28 deg.

### SIZE OF IMAGE.

This is perhaps a much easier method for a novice to decide upon the focal length of his lens, as it is often a fault, discovered sometimes too late, that a lens which has been bought gives such small images of objects, unless one gets quite close to the object, as to be extremely disappointing, for we all of us at first have an intense longing to take things big, to get as much as possible on the plate, and to utilize every scrap of the print. Now, the size of an image produced by any lens is always in exact proportion to its equivalent focus, and if the latter is known, the size of an image can be readily calculated, and thus if we have been using an 8-inch lens and find that the image is too small, we may easily choose a lens of another focal length to give us the exact sized image we want. For instance, as we have been using an 8½ lens on a half-plate and the image is very small—say 2 in.—and we want to get an image that will be 4½ in., a simple rule of proportion will tell us what focus lens to use, because we know the longer the focus the larger the image, and *vice versa*:—

$$\therefore \text{As } 2 : 4\frac{1}{2} :: 8\frac{1}{2} : x.$$

$$x = 18\frac{1}{2} \text{ in.}$$

Obviously from this fact we have a ready method of determining the focal length of a lens by comparing the size of the image of an object produced by it with that produced by a lens of known focal length. For instance, we find that the image of an object with a 6½ in. lens is 3½ in., and with our second lens the image of the same object at the same distance and same standpoint of camera measures 5 in.; another little proportion will give us the focal length of the lens in question. It must be clearly understood that this rule applies only to comparative focal lengths, and not absolute or equivalent focal lengths, unless we measure the image of some distant object.

Utilising this rule, it is possible for us to reckon out how near an object we must get to obtain it of a certain size, and also to reckon whether we can include the whole of the image of an object upon a given sized plate, provided we know or can roughly estimate the size of the said object, which is by no means a difficult operation, and the distance of the object from the lens. Let

us take an example or two to make these points a little plainer. We will suppose we are using an  $8\frac{1}{2}$  in. lens, and are placed on the bank of the Thames, and wish to take a steamer going down midstream. The length of the vessel is 250 ft., the distance between the bank and midstream is 200 yards, and we are using a half-plate camera; we shall find that the image of the steamer will be only  $3\frac{1}{2}$  in. in length.

For the object is 200 yards, = 7,200 in., distant.

Then  $7,200 \div 8\frac{1}{2}$  in., the focus of lens, = 847, the amount of reduction or number of times the focus of lens is contained in the distance.

Now the length of the object is 250 ft. = 3,000 in.

$\therefore 3,000 \div 847 = 3\frac{1}{2}$  in. approx.

This is an application of the simple rule that if the object be  $x$  times the focus of the lens from the same, the image is  $\frac{1}{x}$  the size of the object.

Let us take now another example. We have to take a negative of a house, which, for convenience, we will say is 80 ft. in breadth and 45 ft. high, and we are using a whole-plate camera, and have only a distance of 80 ft. available between the camera and the house, because of a high wall, and consequently we desire to know what focus lens we must use to include it in the whole-plate. Let us fix the dimensions of our image at 6 in. in breadth.  $80 \text{ ft.} = 960 \text{ in.}$ ,  $960 \div 6 = 160$ , the amount of reduction; therefore our image will be  $45 \times 12 \div 160 \text{ in.} = 3\frac{1}{4}$  in. in breadth. We now divide the distance by the amount of reduction,  $960 \div 160 = 6 \text{ in.}$ , the necessary focal length.

What we have been considering are practically examples of the laws of "conjugate foci," which has been explained by Mr. Clement J. Leaper in his current articles. It is extremely easy to apply rules and mathematical formulæ, etc., but a little brochure compiled by Mr. J. R. Gotz, and to be obtained from Messrs. Hazell, Watson, and Viney, will be found of very great value, as it contains "Tables of Conjugate Foci Applied to Photographic Lenses," and includes such for lenses from 3 in. to 36 in. focus. It is useful alike for enlarging, reducing, copying, and also for easily finding out such calculations as we have been considering above.

## Exhibitions.

### MR. SAINTON'S SILVER-POINTS.

A CARAVAN journey through France has provided Mr. C. P. Sainton with subjects for fifty-seven silver-point drawings, and oil paintings to the number of fifty, all of which are on view at Messrs. Dowdeswell's. The artist is at the commencement of what we trust will be a prosperous career. To start with an artistic perception of suitable subjects is no small advantage, and this is possessed by Mr. Sainton. He is the son of parents who, in the musical firmament, shone brilliantly. His father was the late M. Prosper Sainton, a former leader of the Sacred Harmonic Society, and husband of the renowned contralto, Madame Sainton-Dolby. In a gipsy caravan Mr. Sainton travelled from Dieppe, in October, 1889, to Nice, where he commenced the work which is now on exhibition. His object was, he says, to give expression to what he saw (from the window of the caravan, as it were) of the French peasantry, and in this he has succeeded. Regarding, first of all, the silver-points, we find "A Pair I Met" (3) both pleasing and natural. The air of *dolce far niente* is reproduced in the sketch with much skill. "Cinderella" (16) is usually depicted in rather more forlorn condition. The softness of these silver-points—e.g., "Grandmother" (29)—reminds one of the engravings in a high-class American magazine. The distance in "A Pipe after Work" (32) is not very effective, and the "Study of a Baby's Head" (38) suffers from the model's lack of beauty. "The Village Beauty" (41) is charming, despite the slightness of execution. Another graceful example of this artist's work is seen in "The Beggar Boy" (55). In the collection of small oil paintings, which are most appropriately framed, we enjoyed "Among the Pine Trees" (71) and "By the Cottage Fire" (74), the latter being most admirable. Mr. Sainton triumphs over the difficulties of depicting grass in a "Shepherdess" (83). In nearly all his oil paintings the faces are pleasantly and sympathetically suggestive of the Sunny South. "A Lounge on the Hay" (91) is perhaps the most ambitious work here ex-

hibited. Though vivid, it is truthful and certainly pretty. Messrs. A. and F. Pears should not lose the opportunity of contrasting "A Smile en Passant" (101) with their famous "You Dirty Boy." The sunshine through the trees is effective in "A Water Carrier" (102), while "Hay Making" (104) is also praiseworthy. Of all the pictures in this Exhibition, it may truthfully be said, as of work by Mr. G. D. Leslie, R.A., that they would be pleasant companions to their possessors.

### MR. ALBERT GOODWIN'S WATER-COLOURS.

An interesting collection of water-colour drawings—the outcome of the last two years' work by Mr. Albert Goodwin, R.W.S.—is now on view at the Fine Art Society's rooms, 148, New Bond Street. The artist, in a modest preface to the catalogue, acknowledges his indebtedness to Arthur Hughes, Ford Madox Brown, and to John Ruskin, "who took me to Italy in a most princely way, and aggravated me out of the license I had hitherto indulged myself (of colour regardless of form), and made me draw." Certain it is that Mr. Goodwin has succeeded in absorbing the spirit of Turner with all the enthusiasm of the author of "Modern Painters." His picture, "Windsor in Sunset Glow," is admirable, while the detail in "Canterbury" (10) is worthy of the highest praise. We should hardly have imagined that a sky such as Mr. Goodwin depicts in "Wells" (11) is often, if ever, seen in England. The artist draws attention to the fact that part of the building in "Abbeville" is out of the perpendicular. A note attached to "Abingdon" informs us that it is "one of the few drawings here painted from nature; most in this collection being done while the memory of the subject was fresh, but away from the place." This, we fancy, explains the crimson sky in "The Watchers of the Arctic Night." Mr. Goodwin is very happy in his paintings which have parts of Switzerland for subjects. "The Righi Unveiling" is a striking and faithful representation of a scene familiar to many by reason of Mark Twain. "Italy from Switzerland," again, will be recognised as most truthful by those who have viewed the scene. To those who recollect the dramatic story of Warren Hastings, "Aylesford Priory" will be of interest. Mr. Goodwin includes some capital sketches of Dordrecht, as well as some very pretty views of Clovelly. The twilight in "Salisbury Close" needed the naive explanation of the artist, who says, "I do not mean to say that all twilights are as blue as this, but this one was." The after-glow in "Clovelly" (55) is, to our thinking, more truthful. Some of Mr. Goodwin's results of a visit to Devonshire are very charming, while the pictures which deal with the Thames (note especially "A Thames Backwater") seem the very scenes which Mr. William Black has familiarised in his "Strange Adventures of a House-boat." The artist says that at forty-five his style is formed, for good or for evil, and we can only congratulate him on such a style as is displayed in this Exhibition.

### A SUMMER AMONG THE FLOWERS.

A small exhibition, comprising seventy water-colour drawings by Mr. Geo. S. Elgood, R.I., calls attention to the general neglect of flowers as subjects for careful study. And yet the greatest artists will stoop to details in order to correctly portray flowers, as is evidenced by the remarkably finished representation of sea-colewort in Raphael's cartoon, "The Miraculous Draught of Fishes." Mr. Elgood has striven, with no little success, to truthfully depict—

"Large drooping poppies and queen hollyhocks,  
With butterflies for crowns, tree peonies,  
And pinks and goldylocks."

In "The Hall Garden" (63) he has given us a perfect bouquet of old-fashioned flowers. When Mr. Elgood deals with mansions erected three hundred years ago, he succeeds in taking us back to the past, as witness "Brympton" (57); in this dainty picture, an artistic effect is given by two peacocks which would have charmed the late Lord Beaconsfield. The scene of so many pilgrimages—"Ann Hathaway's Cottage"—is admirably painted. Inaccurately, as becomes a paradox, the exhibition was described as comprised of "primroses and prim houses." At all events, every one of these drawings at the Fine Art Society's rooms is a pleasant revival of "the days that were." Miss Hope Temple would, we are sure, find inspiration in "Montacute" for a companion to her song "An Old Garden."

## Notes from the Liverpool Centre.

(By our District Editor.)

STRANGELY enough, at first glance, one of the chief features of local interest here to photographers during the week has been the annual Liverpool Dog and Poultry Show. In connection with this show for the past two years prizes have been given for photographs of dogs and birds. The regret is freely expressed, however, that the competitions have not been given greater publicity. Obviously it is of advantage and importance in shows of this kind to record photographically, and, therefore, truly and accurately, the best "points" of the prize-winners in the animal and ornithological world, and to hand down exactly the distinguishing features and characteristics of different breeds and species of dogs and birds, as such features are taken into account and considered by experts and judges. The giving of prizes for photographs by the Executive of the Liverpool Dog and Poultry Show is the outcome of a suggestion made by Mr. Wm. Tomkinson, Vice-President of the Liverpool Association. In the competition this week the prizes were—For dogs:—First prize, silver medal, Mr. R. H. Lord; second prize, bronze medal, Mr. C. Reid; highly commended, Mr. A. J. Gosling. For birds:—First prize, silver medal, Mr. C. Reid; second prize, bronze medal, Mr. W. A. Singleton; highly commended, Mr. W. Weatherley.

While on this subject it may be mentioned that a good photograph of the famous St. Bernard dog, "Sir Bevidere," which was shipped from Liverpool to America a few days ago, would now be invaluable. "Sir Bevidere" was the attraction at the Liverpool Dog and Poultry Show last year. He has been sold recently for £1,500.

Mr. T. S. Mayne writes to the *Liverpool Mercury* as under:—

"I observe in your to-day's London letter reference to a proposed international photographic exhibition in the season of next year. The concluding words are—'The projected exhibition would then show the best results photography has yet attained on the European Continent.'

"Permit me to state that the exhibition to-day announced in another column, promoted by the Liverpool Amateur Photographic Association, in the Walker Art Gallery, will contain a large, if not the most extensive collection of works from abroad. The entries contain exhibits from Russia, France, Germany, India, Australia, as well as exhibits from the leading workers at home. The schedule of conditions inviting exhibitors' support was freely circulated some two or three months ago in English, French, and German. This is the first time any photographic society in the kingdom has made such an effort to obtain Continental support. The result has been most gratifying.

"The optical lime-light demonstrations of 1888, which gave such pleasure to close on 30,000 visitors, will be a nightly feature, and will be duly announced in your advertising columns later on.

"The opening is fixed for Friday, 6th March, an evening conversation for season-ticket-holders.

THE HONORARY SECRETARY.

"Liverpool, Jan. 23rd, 1891."

Italy may be added to the countries named above. Among the exhibitors are Prince de la Scaletta, President of the Amateur Photographic Society of Rome; Baron Frederick Brantano, of Hanover; the Spanish Vice-Consul at Zurich; Anselm Schmitz, Cologne, Court photographer; and a host of other aristocratic workers in photography located in Odessa, Poltava, Sicily, United States, India, Australia, etc., etc.

Seven new members, including one lady, were elected to the Liverpool Society at the ordinary meeting this week. Among the other business was the exhibition of a series of sixty slides—chiefly cloud effects—by Mr. F. Anyon, and the distribution of medals awarded in the Society's Prize Competition, 1890. The prize winners were: Lantern Slides—1st prize, Mr. Timmins; 2nd, Mr. Phillips and Mr. Sinclair. Whole-plate—1st prize, Mr. W. H. Wilkinson; 2nd, Mr. Cleaver. Half-plate and under—1st prize, Mr. W. Sutton; 2nd, Mr. Tyrer. Enlargements—1st prize, Mr. Thomas; 2nd, Mr. Sutton.

It should be stated that Mr. Anyon took the place of Mr. J. A. Furnivel, of Manchester, who, owing to indisposition, was debarred reading a paper on "The Optical Lantern, and What can be Done with It." Mr. Anyon will be remembered as one of the early prize medal winners in the series of competitions promoted by the AMATEUR PHOTOGRAPHER.

Every Wednesday evening, until further notice, the Society's

lantern will be at the disposal of members who wish to test slides. On Wednesday, February 11th, Mr. Richard Crowe will deal with "Spotting of Prints and Blocking-out of Skies in Negatives, silver, Platinotype, etc."

The Exhibition Committee have passed a resolution to the effect that "the issue of family tickets to members of the Association will be considered by the Committee, on special application being made in each case."

Saturday, January 31st inst., is the closing day for entries—competitive—in the Exhibition.

## Notes from the Edinburgh Centre.

(By our District Editor.)

THE proprietors of the *Daily Graphic* have handed over their unique exhibit at the late Photographic Exhibition in Edinburgh to Major-General Sir R. Murdoch-Smith, the Director of the Edinburgh Industrial Museum, the largest and finest museum in Scotland, where they will be permanently exhibited. It is a fortunate thing that such a valuable exposition of the latest phase of journalism should be placed where it can be seen by thousands of people every year.

The accounts of the Exhibition have not been made up yet, and the total deficit cannot as yet be stated.

Photography and cycling, as is well known, with many go hand in hand, and a very pleasant illustration of that fact was given in the Café Royal Hotel, Edinburgh, last Friday night, when the Waverley Road Club, a vigorous cycling institution, gave their annual smoking concert. Besides the usual entertainment, a very enjoyable display was given of lantern slides from photographs taken by cyclists, showing the scenery of the leading tourist roads in the United Kingdom. The lantern arrangements were made by Mr. J. McKean, Leith, assisted by Mr. J. M. Turnbull, Edinburgh, and everything went off most satisfactorily.

## Apparatus.

MR. C. C. VEVERS, of Leeds, has sent us a very useful little flash-lamp, which he is selling at 1s. 6d., fitted complete with pneumatic ball and tube. The glass tube is charged with magnesium powder, and a few drops of methylated spirit poured upon a gauze mat, the spirit is ignited and the ball squeezed, an instantaneous and brilliant flash being the result. At this season of the year many of our readers are thinking of going in for flash-light photography; they would do well to procure Vever's lamp, which is the cheapest in the market.

THE BLACKFRIARS PHOTOGRAPHIC AND SENSITISING COMPANY, 1, Surrey Row, Blackfriars Road, S.E., have considerably extended their sphere of work, and send us a remarkably cheap set, camera, lens, tripod, and double dark-slide, which, under the name of the "Boys' set," they are selling at 7s. 6d. The camera is well made with cloth bellows body, the lens gives very good definition, and the whole kit is a marvel of cheapness and just the present for boys taking up photography. We have no doubt thousands will be sold. It is not a toy, but a really serviceable quarter-plate kit. The firm are also supplying well-made printing frames as a speciality, which are as cheap as any in the market. They are also offering some specially cheap dark-room lamps at 3s. and 3s. 6d. We should advise our readers to make a call at 1, Surrey Row. The Company have a very perfect half-plate set for £2 12s. 6d., which should be seen by beginners.

A Photographic Exchange Club.—Mr. R. W. Copeman (Kuklos Cottage, Henstridge, Blandford) has asked us to state that he is desirous of forming amongst amateurs—not too advanced—a Photographic Exchange Club, for the mutual exchange and criticism of prints among members on the ever-circulating portfolio system. He has several names, and would be glad to hear from others, to make the number up to ten or twelve, so as to get the club started at once. Rules and nominal subscriptions, to cover expenses, to be arranged by members later on.

## Reviews.

**Optical Projection.** By Lewis Wright. (London: Longmans, Green, and Co.) Price 6s.

This book, which is really a treatise upon the use of the optical lantern for exhibition purposes and scientific demonstration, is a most carefully written work, and although much has been published in works of a similar nature, still, to the professor and student "Optical Projection" must prove of immense service. The first ten chapters treat of the optical lantern mainly for exhibition purposes, viz., Projection—The parts of a lantern—The radiant—The limelight—Preparation of gases—Compressed gases—The oxy-ether and oxy-carbon lights—Lanterns and their manipulation—Screens and other lantern accessories—Slides, carriers, and effects. The remaining chapters are upon the more advanced and scientific sections of "Optical Projection," dealing with The projection microscope—Mechanical and molecular physics—Physiological demonstration—Chemistry, sound—Light, reflection, refraction, dispersion, and colour—The spectrum—Interference of light—Lantern polarising apparatus—Polarised light—Heat—Magnetism and electricity, etc.

In every section the most complete instruction is given; the book is illustrated with some two hundred and thirty wood-cuts, and contains a very complete and exhaustive index. We are sure that many of the more advanced workers in photography will gladly possess themselves of a copy of Mr. Wright's "Optical Projection."

**Photography as a Business.** By H. P. Robinson. (Bradford: Percy Lund and Co.)

This little book is a reprint of a series of articles which appeared in the columns of the *Practical Photographer*, from the pen of Mr. Robinson, who, from his practical experience, is well able to give valuable hints to professional photographers, for whose benefit the articles were written, and are now published in book form.

## Societies' Meetings.

**NOTE.**—In this column the Editor can of necessity only give a brief summary of the proceedings. Papers read before societies will appear in the PHOTOGRAPHIC REPORTER, and the Editor of the REPORTER will be glad to receive reports for insertion as early as possible after the meetings have been held.

**Brixton and Clapham.**—On Thursday, the 22nd inst., Dr. J. Reynolds, F.R.G.S., Vice-President of the Club, gave a most interesting lecture on "Iceland," illustrating the same with slides from photographs taken on a recent trip. Next meeting, February 5th, members' lantern night.

**Bury.**—At the ordinary meeting on the 21st inst., Mr. S. Litton, an active member of the Society, read a most interesting paper on "Cold Bath Platinotype." At the next meeting, February 18th, there will be a lantern exhibition of members' slides.

**Cardiff.**—At the ordinary meeting on the 23rd inst., Mr. C. P. Gooch in the chair, Mr. W. Purley gave a lecture on "Plain Paper Printing."

**Croydon Micro.**—The annual meeting of this Club was held on the 21st inst., when the President read his address, which reviewed the history of the Club for the past year. Mr. Lovett stated that there was a steady increase of members, the photography section alone numbering over sixty, and the whole Club over three hundred. Mr. E. B. Sturge was appointed Treasurer to the Club in the place of Mr. McKean, who has temporarily left Croydon, and Messrs. McKean and Gower (Hon. Secretary, Photographic Section) filled the two vacancies on the Committee. Nine new members were selected, and several fresh names were nominated.

**Glasgow.**—The annual general meeting of this Association was held on the 19th inst. Mr. John Morison, jun., took the chair on his election as President. The following office-bearers were elected for 1891:—Vice-President, Mr. Thomas Taylor; Treasurer, Mr. Hugh Reid; Secretaries, Messrs. William Goodwin and J. O. Oliver; and a Council of six members. Mr. Thomas Taylor then gave an interesting demonstration of "Platinotype Printing."

**Hackney.**—The American slides were shown before this Society on the 22nd inst. At the conclusion, slides by members were shown, Messrs. Barton, Gosling, and the Secretary contributing, to which were added some charming Woodbury slides of Niagara.

**Hastings and St. Leonards.**—The annual meeting was held on the 19th inst., when Mr. J. H. Mayor presided. All the officers were

re-elected, with the exception of Mr. Thomas, in place of whom Mr. Joshua Smith was added to the Council. Mr. H. Smith proceeded to give a demonstration on the Kodak.

**Holborn.**—On the 23rd inst. Mr. E. Clifton gave a demonstration on "Intensifying and Reducing."

**Ireland.**—A technical meeting was held on the 22nd inst., Mr. H. Bewly in the chair. Mr. H. M. Smith gave a demonstration and introduced the new No. 4 "Folding" Kodak.

**Isle of Thanet.**—At the meeting on the 21st inst., Mr. J. Howson, of the Britannia Works Company, demonstrated the methods of working to the greatest advantage the Ilford bromide paper, and the new "Special" lantern-slides. The beautiful collection of specimens brought by the demonstrator were much appreciated by those present.

**Lewisham.**—At the meeting held on the 23rd inst., Mr. Alfred H. Miles in the chair, Professor Lambert, M.A., gave a very able lecture upon the "Elementary Optical Laws Governing the Formation of Images by Lenses," which was listened to with great interest by a large audience. The lecture was made most interesting by numerous illustrations by the aid of the lantern.

**Luton.**—The annual meeting was held at the Coffee Tavern, Cheapside, on the 19th inst., when the accounts were passed, and the following gentlemen elected on the Council for the ensuing year:—President, Cyril Flower, Esq., M.P.; Vice-Presidents, the Mayor of Luton, Mr. A. Carruthers, Mr. F. E. Percival, and Mr. W. Wardill; Council, Messrs. A. V. Spratley, T. Dawson, W. Morrison, J. Davis, W. Roberts, G. W. Bindloss; Hon. Secretary, Mr. George Bunyan (19, Elizabeth Street).

**North London.**—The ordinary meeting was held on the 20th inst. This being a lantern night, a number of excellent slides by Messrs. Grover, Illingsworth, and the Secretary were passed through the lantern. February 3rd will be a technical evening, and on February 17th the lantern slide competition will take place.

**Phot. Soc. of Great Britain.**—Technical meeting, Tuesday, January 27th, 1891, H. Chapman Jones, F.I.C., F.C.S., member of Council, in the chair. The Chairman exhibited a Wray's detective lens of 6 in. focus, working at  $f/8$ , and covering a whole-plate. Mr. Addenbroke mentioned that he had a set of combination lenses, ranging from 4 to 24 in. focus, but they had not proved very successful. He thought that the use of aluminium would be of service in diminishing the weight of the cells. In answer to a question, he said it could be made for 8s. a pound, and that it could be easily soldered; it also turned well. Returning to the subject of combination lenses, Mr. W. England said he had used Darlot's lenses with satisfactory results. Mr. W. Bedford employed a Darlot, giving him a combination ranging from 7 in. focus to 29½ in. focus, and he found that it was possible to use the extreme combinations, although it was suggested that it was inadvisable to do so. Mr. D. E. Debenham suggested that if daguerreotype plates could be made more sensitive, they might prove very useful in scientific work. Mr. W. H. Harrison raised the question as to whether double or triple condensers were best for the optical lantern. Mr. T. E. Freshwater considered the latter form best for small and the former for large discs. Mr. W. E. Debenham said a great fault of the ordinary double condenser was its large amount of spherical aberration. A discussion then ensued as to the effect of the course of illumination upon the slide.

**Rossendale.**—The third lantern evening and concert of the above was held on the 21st inst. The lantern was efficiently worked by Mr. B. Compston, F.R.H.S., and much interest was taken by an appreciative and numerous audience in the pleasing variety of work and subjects contributed. During intervals songs were contributed.

**Spen Valley.**—The monthly meeting was held on the 20th inst., Dr. Farrow, President, in the chair. Mr. Mills, of Huddersfield, read a valuable paper on "Interior Photography," a branch of the art in which he has had great experience. An interesting discussion followed the reading of the paper.

**St. Bartholomew's Hospital Phot. Soc.**—The first meeting of the society this year was held in the anatomical theatre of the hospital on January 21st, Dr. W. J. Russell, F.R.S., in the chair. Mr. E. C. Bousfield gave a demonstration on the subject of "Photography." Mr. Bousfield showed his microscope and camera, and described the method he had adopted for deadening the vibration caused by vehicular traffic, etc. By means of the lime-light he then exhibited over forty slides, which were chiefly pathological, a few being zoological and physiological. Several bacteriological slides were thrown on the screen, and were much appreciated by the members. Mr. Bousfield expressed his thanks to Mr. Andrew Pringle for the use of some of his slides, and to Mr. C. H. Cosens for his lantern.

**Sydenham.**—The ordinary meeting was held at the Greyhound Hotel on the 20th inst., Mr. T. C. Cole in the chair. An interesting and instructive paper upon "Lenses" was read by Mr. P. Barlow, and a discussion followed. The next meeting will be held at the same place on February 3rd at 8 p.m.

**West London.**—At the meeting on the 23rd inst., the President (Mr. W. A. Brown) read a letter from Mr. John A. Hodges, Hon. Sec., resigning his position on account of ill-health. The President said all the members would agree with him in regretting the great loss which the Society would sustain through Mr. Hodges' resignation, but as they could not stand in the way, especially as Mr. Hodges was strictly ordered by his medical adviser to abstain from the work of Secretary, the Council had accepted his resignation. A resolution to this effect was therefore put and carried unanimously. The President then announced that the Council had appointed Mr. Harry Selby, of 42, Ladbroke Grove Road, W., to the vacant post of Hon. Sec., subject to confirmation by the members. The appointment was unanimously confirmed. The following appointments were then confirmed:—Mr. Leslie Selby to be Assistant Hon. Sec., vice Mr. Lionel C. Bennett, who resigns; Mr. L. Bennett and Mr. J. Stein to be Auditors, vice Messrs. H. and L. Selby, who vacate the posts on accepting the posts of Hon. Sec. and Assistant Hon. Sec. respectively. The President then presented the Society medals to the successful competitors at the recent exhibition. Mr. J. Martin Dickens then read his paper, "A Suggestion and a Photographic Yarn."

**West Surrey.**—At the annual general meeting, Mr. J. H. Smith, 107, Falcon Road, Clapham Junction, was appointed Hon. Secretary, in place of Mr. James, resigned.

**Wigan.**—The meeting on the 22nd inst. was a lantern evening.

## Quarterly Examinations in Photography.

**Question 4.**—Describe the methods for testing a lens for chromatic and spherical aberration, the aberration of form, the aberration of thickness, and the aberration of position of lenses?

**ANSWER.**—(1) For chromatic aberration a focimeter is used, but a clearly divided rule placed at some little distance leaning away from the camera will answer as well, so that the divisions may be read on the screen. For these tests substitute a sheet of plain glass for the ground-glass in camera, set up and level carefully. Focus for a division on or near centre of screen, notice number of divisions in focus with a given aperture. Take a photograph with same aperture, observe if there is any difference in definition of divisions on negative and screen; the chemical and visual foci do not coincide if this is the case. Great care must be taken that the dark-slide is in register. Should the defect non-coincidence of foci exist, this method will show the distance the focussing screen must be moved in order that it may coincide with the actinic focus.

(2) Tests for the aberration of form and thickness, and spherical aberration may be made by setting up camera as before, and parallel with a board on which has been pasted a piece of printed matter, or a flat sheet of card ruled in squares at such a distance that its image covers the focussing screen. The image is examined at full aperture and note made of diaphragm required to bring the whole in focus; compare results obtained from different lenses. The amount of spherical aberration may be further tested for by focussing for a

point near the edge of screen with a moderate stop, and a negative taken.

(3) For aberration of position, obtain the image of a watch-face on the focussing screen, and compare the fine strokes in figures (Roman) at right angles to one another, say XII. and IX., and note if they can be brought into focus simultaneously.—ELECTRA.

**Question 5.**—What is the meaning of the terms chemical and visual foci? Explain the principle of constructing an achromatic doublet from two uncorrected lenses, if this can be done?

**ANSWER.**—A convex lens is, as its name implies, thicker at the centre than at the edges; therefore the blue rays are bent more toward the axis than the yellow rays. The focus or intersection of the blue rays is therefore nearer to the lens than the intersection of the yellow rays.

The eye is most affected by the yellow rays, and their intersection is called the visual focus; but the photographic plate is most affected by the blue rays, and their intersection is called (wrongly) the chemical focus. Chemical focus is not correct, because all chemical actions do not have their maxima in the blue, although that of the impress of the latent image on bromide, chloride, or iodide of silver does.

Two uncorrected convex lenses cannot be combined to form a doublet that will throw an achromatic image on to a screen. They can be combined so as to form an achromatic eyepiece, owing to the fact that to the eye two or more rays that are parallel appear coincident. The different coloured rays from an object are rendered parallel by using two lenses, separated by a distance equal to half the sum of their foci.

An achromatic lens can, of course, be formed by a convex and a concave lens of different glass, and in the sense of being made of two lenses it might be called a doublet, but it is not usually so called in photography.—C.

**Question 6.**—What is a "flare" and a "ghost," and how are they caused?

**ANSWER.**—A flare is a circular patch of light seen on the ground glass of the focussing screen in line with the axis of the lens, and also making its appearance as a patch of fog in the centre of a negative. The opening of the diaphragm is reflected on the surface of the lens, and a distinct image formed of it, and when this image coincides with the focal length of the lens, a flare spot is caused, which is really an image of the diaphragm aperture. It is also largely caused by the edges of the diaphragm being worn bright, a defect to which Iris diaphragms are particularly liable. Ghosts are secondary images of bright objects appearing on a part of the plate on the opposite side of the axis of the lens to that upon which the principal image appears. They are caused by the reflection of any very bright part of the picture on the lens, thrown back again upon the plates. A flare spot can be partially overcome by slightly shifting the position of the stop when it is distributed over the whole of the plate, and consequently much less apparent.—WORFIELD

**Note.**—Answers have also been received from and marks awarded to A. C. S., Lindum, R. C. M., Sunesis, Developoid, T. K., and E. B. Six competitors who entered for the competition have not sent in any answers this week.

## To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance,

the number and full title of the query referred to.

## QUERIES.

**4467. Toning Bromide Paper.**—Is this possible? Should be glad of any hints from those who have tried.—NELL READ.

**4468. Enlarging by Artificial Light.**—Would any brother amateur kindly tell me if it would be possible to enlarge on bromide paper with an ordinary paraffin lamp, as used in the sitting room, as we have no gas about here? I cannot stop the flare spot showing on the ground-glass, therefore conclude there must be a special lamp for enlarging purposes.—PROVINCIAL.

**4469. Hand Camera for a Lady.**—Can anyone recommend a really good hand-camera for a lady's use? Price not to exceed £5.—LADY AMATEUR.

**4470. Bromide Prints.**—I have printed this evening six prints on Fry's Argotype paper; some are covered with bubbles, and others have a dark metallic gloss over the surface. I exposed them for fifteen seconds to two gas burners in a chandelier, and developed according to ferrous oxalate formula. Will some one please tell me how these defects can be prevented? Otherwise the prints are good.—TE WIRIMU.

**4471. French Scientific and Optical Instruments.**—What would be the best French paper to advertise in for scientific and optical instruments? Who imports such into England?—ISTRIEL.

**4472. Paget Prize Plates.**—Will someone kindly

give me a formula for developing these plates with hydroquinone?—SYDENHAM.

**4473. Aristotype.**—When making up toning and fixing bath for the above, it goes a dirty brown. Must I mix in the order given? Will silver scraps from ordinary paper do, instead of Aristotype scraps?—J. J.

**4474. Spotting.**—Will anyone tell me how to spot my prints whether before or after burnishing? And what colour is used?—J. J.

**4475. Mounting Aristotype Paper.**—Having lately printed on the Aristo and albumen papers several camera bits with a nice polished surface, and which are backed up with cartridge paper, I will thank a brother to advise me as to the best mountant to apply to the edges of prints, since they need a strong adhesive, being backed up? Glue I find too risky to use, as it soon hardens, and it oozes out from under the mount.—T. K. FAIRLESS.

**4476. Making a Camera.**—I wish to make a half-plate camera, and should feel obliged if some reader would kindly furnish me with the necessary measurements, or refer to some book in which I could obtain them?—H. T. N.

**4477. Views on the Rhine.**—Can any brother amateur inform me where I can procure views of the Rhine district, either in London or Cologne?—KENDAL.

## QUERIES UNANSWERED.

Jan. 16th.—Nos. 4444, 4445, 4447, 4449, 4451, 4453, 4455, 4456, 4457, 4459.

Jan. 23rd.—4460, 4463, 4465.

## ANSWERS.

4462. **Shutter.**—I do not think you can get a reliable shutter at the price you mention. I would recommend you to buy the Thornton-Pickard time shutter, as I believe it is the best in the market at present. The price, of course, varies according to the size of the lens, running from 18s. 6d. to 47s. 6d. for times and instantaneous, and from 11s. 6d. to 40s. 6d. for instantaneous only.—HAMISH.

4463. **Loss of Tone. Matt Surface Prints.**—Provided the negative is one of sufficient intensity, purple tones that will remain can be got from a toning and fixing formula combined. From long experience I recommend Warnerke's formula:

Hypo	...	...	...	10 "z.
Water	...	...	...	10 "
B (stock solution).				
Chloride gold	...	...	...	15 gr.
Water	...	...	...	15 drms.

When A is dissolved, mix 1 drms. of B with 11 drms. water, and add to A, with constant stirring and slowly. The bath improves by keeping. Print well beyond the depth you require. You will find it fade at first in the bath and then recover. The toning and fixing go on together, the latter being complete in ten minutes; the time of toning is variable. Add more gold after toning one sheet of paper.—ISIS.

4464. **Lacquering.**—Laquer can be obtained at most chemists', or prepared as follows:

Seedlac	...	...	...	6 oz.
Well-ground copal	...	...	...	2 "
Dagon's blood	...	...	...	40 gr.
Extract red sandal wood	...	...	...	30 "
Saffron	...	...	...	36 "
Ground glass	...	...	...	4 oz.
Pure alcohol	...	...	...	40 "

Dissolve. Article must be perfectly clean and gently heated, a little hotter than back of hand can stand. Apply lacquer with camel-hair brush. If "Niké" wishes further information, will gladly answer anything further by post. My address with Editor.—DERWEN DABU.

4458. **Combination Rectigraph.**—I used one with a fair amount of success last season, and shall be happy to send "Amateur" prints taken with it and full particulars of same if he will write me direct. Editor has address.—ICONOCLAST II.

4461. **Roll-Holder.**—I can recommend "Quandary" to invest in a roll-holder, as I use one, and like it very much. Care should be taken to cut off just the right quantity of film before development. Though there is a registering apparatus to facilitate this, I do not find the films any more trouble to manipulate than glass negatives. For developing, I use a dish with a glass bottom and wooden sides, with slits of wood along the side to keep the film down.—X. Y. Z.

## EDITORIAL.

F. G. PATTERSON.—You are eligible to compete in any of our competitions. Glad to hear of your success at Edinburgh.

C. S. COBB.—Many thanks. Shall use the matter as soon as possible. Sorry to have bothered you about the medal.

S. FRANCIS CLARKE.—Your application for "Monthly Competitions" shall have attention. Really we think the photographic society having the loan of prints might support our enterprise to the extent of purchasing a copy of the *Photographic Reporter*. We note the advances made in photography at Louth in another column.

S. ROACH.—We know of no photographic society at Farnham.

A. W. GOTTLIEB.—Many thanks for your letter.

H. HOLT.—The fee is 2½ per cent. on the sale price, or a minimum fee of 2s. 6d.

FRANCIS W. HANNA.—We do not criticise the lantern slides. Shall be very pleased to have an account of photographic work in Madras.

ICONOCLAST II.—The matter must slide now, as we really cannot trace the questions. Use the alum bath.

W. WEBER.—The enlarging apparatus you name is in every way a serviceable instrument and will do all you require. We shall be very pleased to give opinion and advice upon any print you may send us. We are obliged for all your kind remarks with regard to the AMATEUR PHOTOGRAPHER.

D. M. HAMISH.—We have sent your letter to the manufacturers, as they are better able to advise you than we are.

E. DILLON.—The work must be entirely your own. Entry forms will be sent you.

A. M. WILSON.—Shall be glad to criticise prints. For such criticism no fee is charged.

J. M. HORTON.—Unfortunately omitted. We shall, therefore, be a week short this quarter. The answers will miss a week.

J. PAWSEY AND CO.—We note your letter, and the publishers will write you.

W. J. KIDD.—We have your paper, and will, if possible, publish same in the *Reporter*, but cannot promise to do so.

MISS F. T. STONE (Florence).—The contents of

your letter are noted. Our publishers have sent on account, and we will fill up entry form.

KENDAL.—Why not try the "Lantern Slide Exchange"?

C. O. VEVERS.—Duly received. Will notice.

CHAS. HALL.—We should think there would be no objection on.

MR. J. C. COLVILL.—Will report in due course.

W. FENTON JONES.—The address is published in the *Photographic Reporter*. What do you want us to do?

DOCKY.—Wire to hand. Of course it does.

DUN.—Leapers "Experimental Photography" (1s.), Harrison's "Photography for All" (1s.), and "Dictionary of Photography" (2s. 6d.), to be had from our publishers. By all means get a tripod camera. We should recommend half-plate size, and use carriers for quarter-plates to begin with; 1 oz. of pyro, 7 oz. of hypo, one packet of cut sensitized paper, printing frames, three dishes, a measure or two. We shall be glad to help you at any time.

B. DILLON (Algiers).—"Cristallos" contains ferrocyanide of potash, and the iron would combine and form Prussian blue. You should certainly keep one dish for iron, one for ferrous oxalate, one for pyro, and one for hypo.

BENYON.—We reply to your letter by post.

T. KIDD (Spain).—(1) We place as follows—E, B, and F. (2) A new ball is the only thing. Entry forms sent on. We will allow you some grace in the examination, as you are abroad.

F. J. QUICK.—Weak acid would be 1 to 100. We shall shortly have an article on the subject from the gentleman named.

ROBY.—You must not be disappointed at getting such results from your sixth negative. The plates are not sufficiently developed, and No. 2 is rather under-exposed; both prints are very badly trimmed and mounded. Let us see some more work in a month.

F. G., SHEFFIELD.—Prints returned this week. Let us know now what gold you use; if you carefully follow the instructions, we fail to see where you go wrong. Let us have half a dozen untuned prints with the directions, and we will try them and send you results.

LICHTBLID.—For films, C, for 4½ by 3½, is certainly the finest instrument in the market, and you will not be disappointed if you get it. Write the makers for detailed pamphlet. (D) There is no work at present in the market. Will not Leaper's articles now appearing in our columns assist you? If you can read German, as we suppose from your nom-de-plume, we can recommend you a good work in German, which our publishers can get for you, price 6s.

BLACK GRAY (France).—(1) A or L are the only two likely to suit you, but both require dark-slides; the number of plates is therefore limited. If for films, we should suggest L with a roll-holder. (2) We should choose No. 1.

KENDAL.—Give about the same exposure as you have already done, but commence development with about one-tenth the ordinary quantity of pyro, normal quantity of accelerator and restrainer; when all detail is out, add more pyro to obtain density.

HARRY HOLT.—No. 1. Good; would be improved by more detail where fogged. (2) Cut off an inch of foreground to improve it; very fair. (3) Wrongly developed, the blaze of light has lost you the detail and cut off as you suggest. (4) Good. (5) Good, but too much foreground. (6) Spoilt by the loss of monument base. (7) Good for a morning effect; if the clouds are put in, the result is very natural.

C. D.—No. 1 is worth price asked. No. 3. Yes with shutter fixed. No. 6. No, but much heavier than 1. We should use an R.R. of 8½ in. and a single lens of 13 or 14 in. focus.

W. H. GRAHAM.—The solutions are those used for intensifying negatives. The plate is soaked in No. 1 till white, then well washed, and placed in No. 2 till blackened.

G. N. TRAVERS.—The instrument named is quite as good as any at the price. We should advise you to see also the one at £3 3s.

PUZZLED.—The metallic reduction may be caused by the non-actinic paper, as you suggest, or by some emanation from the wood of the cabinet, or by gas fumes. Let us know what wood the cabinet is made of; in the meanwhile we will try the paper, and let you know result.

ISIS.—(1) We certainly plump for films under the circumstances. There would not be the slightest objection to placing a film between two lantern glasses and temporarily binding them together, which annihilates your objection. (2) We prefer a 6 in. lens—the one named we can highly recommend from personal experience. (3) We choose No. 9. Always at your service.

EXCELLENCE.—(1) Pin the cabinet against a wall in a good light, place the camera exactly opposite and parallel to it; front light should be used for copying as much as possible. (2) The print is from an over-exposed negative, fogged in development, we think, but we should prefer to see the negative before giving a decided opinion. (3) This depends so much upon the plate used and composition of developer that it is impossible to answer this query satisfactorily; the normal developer should be sufficient to bring about desired result. (4) If you put your

transparencies in the alum bath without washing well after developing, hydrate of aluminium would be precipitated as a slimy deposit on and in the film; if you do not wash the plate well between the alum and hypo bath, the latter would be decomposed and sulphur and oxide of aluminium be deposited.

BIRKENHEAD.—Have you tried the photographic dealers near you? It is quoted as a regular thing by many London photographic dealers. If you cannot get it in Liverpool let us know, and we will send you a card.

CESTRIA.—Please let us have two or three negatives up by post which clearly show the marks.

CLIFFORD D. FOTHERGILL (Biarritz).—The questions set were stiff, as you say, because we want competitors to read up reference works, etc., so as to answer correctly. It is no use asking questions everybody can answer, and which will convey no useful information. We shall expect to receive more answers from you, and you are not alone in your misery. No. 1 we place as follows:—1, 2, 3, 1. No. 2, we always give advice such as you require free, with the greatest of pleasure. Send as many as you like.

E. B. WAIN.—(1) Both are good instruments; we prefer 2. (2) The dark slides are good, and an improvement on some of the old forms.

F. PARTRIDGE.—Use the chrome alum clearing bath, on page 34 of "Dictionary"; when the negatives have been washed free from hypo, leave them in the bath for a minute or two, and then wash for half-an-hour.

ALPHA.—The lens is a French one by Gaudin, and is a good instrument, and well worth keeping. The print sent is a great deal too dark.

TYKO.—(1) The lens will take good landscapes, if stopped down to about f/24 or f/32; but is certainly not so suitable as No. 2. (2) They both work approximately at the same aperture. (3) We should certainly advise No. 2.

SINGAPORE.—We believe plates can be obtained there. Send us your name and address at once, and we will write you. If you enclosed your card it has been mislaid.

NOVICE.—Expose one plate for 20 seconds, and another for 90 seconds. Send them up to us, and we will develop them, and send you results. Be careful to mark the wrappers of plate, with exposure given.

W. F. HIGH.—(1) The appearance of the plate depends greatly upon what plate you are using, and method of development; generally the point is when the high lights are plainly visible on the back of the plate. With thinly-coated plates the whole image should be so visible. (2) We do not quite understand this query. What do you mean by "a perfectly clear sky"? If you leave the plate in the developer till it is quite black, the other part of the negative would grow much denser, and finally veil over, though this point may be delayed by the use of bromide. Write again, and explain yourself more fully, and we will answer you.

## Quarterly Examinations in Photography.

## QUESTIONS.

7. Give the equations representing the chemical changes which take place when making an emulsion from iodide and bromide of potassium and nitrate of silver. Which silver salt is precipitated first; and is the resultant salt a mixture or a compound?
8. State briefly the leading theory or theories of the action of light on a dry plate. [Limit, 350 words.]
9. It is required to obtain a negative of the interior of a church with a stained-glass window in the east end, but otherwise well lighted. What time of day and what light would you choose; what plates, and what method of development?

(Latest Day for Answers—February 9th.)

## RULES.

1. Answers must be received on the morning of the Monday week following the publication of the question.
2. All answers must be preceded by the question, and should be written on one side of the paper only.
3. A *nom de plume* may be used, but in every case the full name and address must also be given.
4. Answers must not exceed 250 words, unless otherwise stated by the examiners.

5. Those desirous of competing must apply to have their names entered, as these examinations are intended to encourage the study of the theory and practice of photography. Authorities upon photographic matters and contributors to the photographic journals will not be allowed to compete.

Marks will be given for all answers, and when possible, the three best answers will be published. Three prizes will be awarded at the end of each quarter.

All communications to be addressed to:—

"EXAMINATION DEPARTMENT,"  
AMATEUR PHOTOGRAPHER,  
1, CREED LANE,  
LONDON, E.C.

## Lantern Slide Exchange.

**NOTE.**—There is NO CHARGE for insertion in this column. All announcements must be received by Tuesday morning.

Several sets tables, scenery, etc., plain and coloured, to exchange for scripture and temperance sets.—List of R. W. Copeman, Kuklos Cottage, Henstridge, Somerset.

Dovedale.—Would like good slide of Lion's Face Rock in exchange for other Dovedale or Derbyshire view.—J. G. Patterson, Westwood, Eskbank, Midlothian.

William H. Pratt, 27, Regent Street, Nottingham, wishes to exchange slides of microscopical subjects for good slides of animal studies, or slides of Scotch or Irish scenery, on approval.

## Sale and Exchange.

"Amateur Photographer," etc.—AMATEUR PHOTOGRAPHER, from January, 1887, to present date, 1887 and 1888 lately bound in four vols.; also "Photographic Art Journals," from July, 1889, to December, 1890; have cost (including binding of first four vols.), nearly £3; all clean, and equal to new; no reasonable offer refused.—Thos. Burnell, Bradmore College, Chiswick, W.

AMATEUR PHOTOGRAPHER, four years, about 200 numbers, containing Wall's "Dictionary" from January, 1887; price 10s. 6d.; or will exchange. Also lot of sundries, cheap; stamp for list.—Address, Walker, Scotchholme, Nottingham.

**Cameras, etc.**—Camera (whole-plate, bellows-body) for sale, seven double slides, all good order.—Gordon, Cupar.

Lancaster's International 1890 quarter-plate, complete, with three slides, canvas case, perfect condition; 45s.; or exchange for good half-plate and slides only.—Landale, High Street, Kirkcaldy.

Stereo camera, brass-bound (by Hare), long extension, with six double backs, in leather case, in perfect order; cost £15.—Capt. de Crespigny, Werge's Photographic Stores, Berners Street, Oxford Street, where camera can be seen; price £5.

Lancaster's Extra-Special whole-plate camera, rack and screw adjustment, three double backs, in canvas case, £4 10s.; half-plate International, complete, two double backs, in canvas case, £3 10s.; 15 by 12 London-made modern camera, leather bellows, reversing and swing back, three double backs, £10 10s.; 12 by 10 ditto, £8 10s.—J. Biddle, 97, Medlock Street, Manchester.

Lancaster's quarter-plate Le Meritoire, one double back, stand, and three dishes; also tricycle, Crippen pattern, 30 in. wheels, bicycle steering, four ball bearing axle balls to cranks and pedals; price £9 10s.—356, King's Road, Chelsea.

**Cameras, Lenses, etc.**—For sale, whole-plate camera, with all movements, and three double slides, sliding tripod, Taylor's 9 by 7 R.R. lens, Ross' 8 by 5 R.S., Wray's whole-plate W.A. landscape, and Kershaw shutter to fit 9 by 7, all in good condition; what offers?—Address, W. Milburn, Brunswick Street, Carlisle.

Camera, half-plate (Chapman, Manchester), in fair condition, Darlot lens, two dark slides, and stand; 60s.—A. E. French, Ridsen, Hawkhurst.

Whole-plate long-extension camera, leather bellows, dark-slide, portrait lens (cost £6), dishes, chemicals, backgrounds; particulars; offers?—190, Heyside, Oldham.

Half plate camera, lens, slides, stand, and case; will exchange for field or opera glasses, and little cash.—Address, 24, Stratford Street, Birmingham.

Lancaster's 1890 half-plate Instantograph, with rapid rectilinear lens, tripod, slide, numerous sundries; lot 84s.; bargain; no cards, please.—Charles Howard, 55, Percival Street, London.

Good quarter-plate camera, reversing swing-back, rack adjustment, double extension, six double dark-slides, Optimus R.R. lens, waterproof case; £7 10s.—Burton, 53, Jasmine Grove, Anley.

Mayfield's 3½ by 3¼ camera, slides, lens; cost 90s.; will sell for 25s.—Sinclair, 139, Cannon Street, London.

Camera, stand, dark-slide, landscape and portrait lenses (by Marion), six dishes, negative box, two frames, all 5 by 4; price 45s.—No. 104, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.  
**Gas Bag**, 4 ft., two interchangeable jets, iron

retort, all good condition; 35s., or offers.—40, Coniger Road, Parsons' Green, S.W.

**Hand-Camera.**—Hand-camera (Samuel's), nearly new; cost 30s.; take 15s.—Fawcett, 3, Sunny Bank, Leeds, Yorkshire.

**Hand-Camera, etc.**—Quarter-plate hand-camera, with roll-holder, excellent rectilinear lens, f/8, rotating stops, shutter, focussing arrangement, finder, perfect; 50s.—No. 105, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

**Lanterns.**—Mahogany-bodied binocular lantern, 4½ in. condensers, patent dissolver, jets, and large selection slides, cheap, cash or exchange; full particulars.—Copeman, Henstridge.

Massive binocular, brass fronts, jets, dissolver, slides, new condition; cost £35; offers?—190, Heyside, Oldham.

**Lanterns, etc.**—Lectures, complete outfit, lime and oil-light lanterns, cylinders, regulator screen, and elevator, also about 300 best slides, consisting of life models, humour, and temperance.—Sale price and particulars of H. L., 35, Broad Street, Reading.

Optimus mahogany enlarging lantern, beautiful instrument, nearly new, 7 in. condenser, lens, lamp, carriers for quarter, 5 by 4, and half-plates, all complete; cost £3 13s.; sell immediately for £5.—Ellis, 7, Park Village West, N.W.

First-class binocular lantern, with all accessories, cylinders, etc.; cost over £40; sell for £24; full particulars.—Edward Dyson, Shambles Lane, Huddersfield.

**Lantern Slides.**—Lantern slides, about 200 coloured life models, effects, comies, etc.; great bargains to clear out.—W. North, 62, New Road, Aylesbury.

**Lantern Transparencies.**—Plain lantern transparencies (good), "Mr. and Mrs. Gladstone," "Boy Reading Tit Bits," and "The Great Healer," sent post free to any address for 1s. 9d.—Marshall, Sutton via Keighley, Yorks.

**Lenses.**—Best quality 5 by 4 rectilinear, also wide-angle, perfect; 20s. each.—T. Hall, Pinfold Lane, Lancaster.

Morley's whole-plate view lens, 6s.; 5 by 4 wide-angle rectilinear, 20s.—Bennett, 43, Mitchell Street, E.C.

Dallmeyer's wide-angle rectilinear lens, 1½ by 6½, revolving stops, good condition, 80s.—No. 104, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, E.C.  
5 by 4 Euryscope, f/6 lens, Waterhouse stops, bargain, 18s.—R. Henry, 2, Hawthorn Villas, Blad Road, Stroud, Glos.

For sale, Dallmeyer's 18 by 16 R.R., £13; ditto 10 by 8, £6 10s.; Ross P.S. No. 7, 90s., No. 4, 55s.; Ross R.S. half-plate, 70s.—Photo, 84, Park Street, Bristol.

**Lenses, etc.**—Half-plate Optimus wide-angle, new, perfect condition, 40s.; whole-plate French rectilinear, Iris stops (by Taylor, Leicester), a splendid instrument, 70s.; whole-plate Kershaw shutter, new, perfect condition, 15s.—Cooper, Chestergate, Stockport.

Levi's portrait lens, 15s.; lantern objective, 10s.; Lerebours and Secretan's quarter-plate portrait lens, 20s.; quarter-plate portrait lens, 15s.—F. R. Upcott, 135, Brigstock Road, Thornton Heath. (Can be seen at the offices of the AMATEUR PHOTOGRAPHER.)

Good half-plate view lens, case of stops, 8s.; carte roller press, 4s.—Parsons, 12, Albert Cottages, Crawley.

Whole-plate R.R., 12½ focus, movable hood, 30s.; Marion's 25s. tripod, 7s. 6d.—W. Field, 253, Canberwell Road, London.

Lancaster's whole-plate Instantograph lens and shutter, as new; 30s.—Isaac Wolfe, Newmarket, co. Cork.

**Outfits.**—Complete outfit, half-plate Empress camera, three double slides, Beck's set of Oasket lenses, 5, 7, and 9 in. focus, interchangeable Iris diaphragm, in snap case, Thornton-Pickard time and Instanto shutter, focussing cloth, all fitting in neat leather case, Ashford's tripod, Optimus travelling lamp; what offers? Giving up photography, but shall not sacrifice. No offer less than £20 considered. Everything high-class.—A. George, The Hollies, Manor Park, Streatham, S.W.

**Platinum**, five-sixths of an ounce, avoirdupois; offers?—40, Coniger Road, Parsons' Green, S.W.

**Sets**—Underwood's 1890 half-plate Instanto set complete, as new, bargain, 67s. 6d.—H. Rowe, Wallbridge, Stroud.

Complete half-plate outfit for sale, long-focus camera, rapid rectilinear lens, three double back backs, three-fold tripod, and all sundries, only new last year, not used twelve times; cost £14; sell for £11, or what offer? approval.—Page, The Firs, Dersham.

Underwood's quarter Tourgraph set and shutter; exchange with cash for hand-camera (Talmer preferred) or offers in cash; approval.—Fucker, Gloucester Road, Teddington.

Quarter-plate set, about 25s. Particulars and price.—West, Peacock Street, Middlesbrough.

Instantograph, Lancaster's, camera, half-plate 1890 revering camera, all latest improvements; rapid rectilinear lens, Waterhouse stops and movable hood, double slide, quarter carrier, folding stand, printing frames, measures ruby lamp, dishes, etc., 80s.; lowest, approval.—Lawrence, 9, Sussex Terrace, Markfield Road, Page Green, N.

**Stereoscope.**—Capital revolving double stereoscope, mahogany, square, good condition, price 21s.; also small hand ditto, 3s. 6d.; quantity of slides, 7s. 6d.; approval, deposit.—W. North, 62, New Road, Aylesbury.

**Sundries.**—Handsome brass-rail fender, full size, suit dining or drawing room, nearly new; cost 35s.; will sacrifice for 18s. 6d.—A. Henry, 4, West Brixton, S.W.

Will's oil, or exchange for good enlarging apparatus, heavy burnisher, 14 in. roller, high-class conjuring apparatus, secrets of good tricks, and optical illusions, etc.; also for sale or exchange, "The Performing Harlequin," in perfect condition, as sold by Bland for £22.—Address, Prof. Weber, Illusionist and Ventriloquist, Waterloo, Liverpool.

Safety bicycle, cushion tyre, diamond frame, Premier type, ball bearings to all parts, including pedals, adjustable to any rider, in splendid condition everywhere; cost £14; price £7 10s.—H. Baker, Warwick House, Acre Lane, Brixton, S.W.

## WANTED.

"Amateur Photographer," numbers for January and February, 1889.—Oxle, 4, Strathearn Place, Edinburgh.

**Burnisher.**—A small burnisher. Apply to S. Kirkham, Court Place, Carlisle.

**Camera.**—Quarter-plate camera.—Richardson, jun., Suffolk Street, Forest Gate.

**Cameras, etc.**—Studio camera, whole-plate, and stand, also studio accessories, cheap.—O. Boardman, Southcote Road, Bournemouth.

Watson's Acme camera, 7½ by 5, complete with turntable and tripod.—No. 93, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

5 by 4 camera with reversing frame central swing-back, three slides; lowest price.—Gibbs, Manchester House, Bedford Street, Bristol.

**Cameras, Lenses, etc.**—Half-plate Tourist camera, three backs, R.R. lens, and tripod, in good condition, by good maker, at reasonable price.—Particulars to Dr. Shelly, Hertford.

**Hand-Cameras.**—Diamond, or other quarter-plate, hand-camera, in good order, cheap.—Athos, Fern Bank, Sherland Road, Twickenham, Middlesex.

**Hand-Cameras, etc.**—Facile hand-camera, quarter-plate must be in good condition and cheap, with finder, and all complete; approval of Editor; deposit.—No. 103, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

**Lantern.**—First quality Lancaster enlarging lantern, 6 in. condensers, or Hughes' bijou half-plate ditto.—M. Bett, Hazel Bank, Sydenham Hill.

"Lampadiorama" (French optical lantern), "Polyopticon," and other opaque lanterns.—R. Owen, Friar's Stile Lodge, Richmond Hill, S.W.

**Lantern Slides.**—To purchase second-hand lantern slides, also coloured slides of stones, etc. Good binocular and 12 by 10 R.R.—W. V. Morris, 34, Parade, Cork.

**Lenses.**—Optimus rapid portrait lens, 5½ in. focus; exchange Kistman roll-holder, half-plate, loaded with transparent film, Newman's pneumatic shutter, or Houghton's changing tent.—Pratt, 27, Regent Street, Nottingham.

Ross' triplet lens, must be in good condition and moderate price.—Wratiaslaw, Braunston, Rugby.

**Outfit.**—Half-plate outfit, rapid, in exchange for splendid St. Bernard dog, female, highest champion pedigree, registered, a prize winner, very affectionate, and well-mannered.—Simpson, Middlesfield, Edinburgh.

**Photographic Views.**—Advertiser desires to purchase attractive whole-plate views of home scenery. Amateurs should send copies, and quote for sale of negatives, also for copies per dozen.—Write with fullest details to F. J. S., care of Eagles and Co., 1, Pilpot Lane, E.C.

**GENUINE** Photo Business for sale, Midland Town, 12,000 inhabitants, practically no opposition, established 3½ years, business increasing rapidly, good opportunity for young man commencing.—No. 106, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, E.C.

[PRICE TWOPENCE.

## OUR VIEWS.

"To hold as 'twere the mirror up to nature."—Shakespeare.

*Members of the Editing staff are "At Home" on Monday afternoons from Two till Five o'clock, and they will gladly give advice upon all photographic matters.]*

ON Monday last several hours were spent in our offices by Messrs. Valentine Blanchard, Philip H. Newman, and A. M. Rossi, judging the photographs contributed to the AMATEUR PHOTOGRAPHER "Holidays with the Camera." The contributions were very critically examined, with the result that in several classes no awards were made. In Class I., "Niepce" or *Progressive Gold Medal*, the award was made in favour of—

JOHN E. AUSTIN . . . . Maidstone

whose contribution "On the Yorkshire Coast" most thoroughly deserves this the highest award that has ever been made in connection with the AMATEUR PHOTOGRAPHER competitions.

In Class II., "Niepce" or *Progressive Silver Medal*, there were no entries. In Class III., "Niepce" or *Progressive Bronze Medal*, there were only two entries, the Medal being awarded to—

JOHN C. LIVINGSTON . . . . Edinburgh

for a very capital series, "Whitby and its Surroundings"

In the remaining three classes two Gold and Silver Medals were offered for competition. The judges did not consider the photographs contributed for either Medals of sufficient merit to permit of their making an award, but in the Bronze Medal class, prizes were awarded to—

CHARLES EMANUEL . . . . Hyde Park

W. H. WHITTARD . . . . Streatham Hill

for very fair work. The judging in this class was one of considerable difficulty, as there were no less than twenty competitors.

It will be remembered that in the "Holidays with the Camera" competition, each competitor had to elect which class he would enter; it is therefore quite possible that work entered for the Gold Medal might have secured a prize had it been entered for a Silver Medal. We also point out the considerable unevenness of photographs contributed, both in artistic value and technical excellence. In several instances two, or perhaps even four, very passable prints would be found in a competitor's work, the rest being of a mediocre character, or with most glaring faults in technique. The adoption of several printing processes militates

very much against success. Altogether we cannot express ourselves as satisfied with the work that has been contributed to this competition. Much time and patient labour have doubtless been spent upon some of the work, and we shall be able to select for our book "Holidays with the Camera," many charming pictures, and much that is interesting from the letterpress that accompanies each contribution; still, we could have wished that the standard of photography would have permitted the judges to have awarded all the medals placed at their disposal.

To future competitors we commend the following suggestions:—Use one make of plates, one developer, one printing process; only send prints from your best negatives. Be careful that in printing in clouds they conform to the lighting of your picture. Mount your prints upon plain mounts, avoiding tinted mounts, and, above all, to see that every picture is taken from the best point of view.

WE have before us the report of the Council of the Photographic Society of Great Britain, in which are mentioned several matters of interest, a list of the papers read, and an analysis of the last Exhibition held. It is interesting to note that at the 1890 Exhibition there were 163 exhibitors—82 members and 81 non-members. There were six foreign exhibitors (America, 2; France, 1; Germany, 2; India, 1). Of the 163 exhibitors, 83 were professionals, and 80 amateurs. In all, 658 frames were hung, containing 808 photographs. We note that the progress medal given by the Society has been awarded to Lieut.-Col. J. Waterhouse, B.Sc. The new home of the Society at 50, Great Russell Street, is now completed, and a reading-room and dark-room are already available for the use of members.

THE annual dinner of the Photographic Society in conjunction with the Solar Club will be given at the Café Royal, on the 9th instant. Professor Glaisher will take the chair. Ladies will be present. The tickets can be obtained of Mr. W. England, 7, St. James's Square, Notting Hill, or of the Secretary of the Photographic Society.

AN old subscriber writes: "I must congratulate you upon the happy thought of giving questions to be answered in your columns. This is calculated to encourage the reading up of the subject much more than anything I know of, and will do much, I am sure, to remove the reproach of the

little *original* work there is now, in comparison to the immense number who practise photography." The questions set by the examiners are so framed as to be educational, and our "Quarterly Examinations in Photography" are not a mere hotch-potch of questions under the guise of a "question-box," ranging from, "Why do I see the picture upside down on the focussing screen?" to "Give a free translation of the following:

Pentachloronaphthalene, isomeride phthalide,  
Dinaphthyle, phenylbutylene, monochloronaphthalenetetrachloride."

We have taken the precaution to bar writers upon photographic matters, lecturers, or scientists from entering our "Quarterly Examinations." They are meant for students, and not for teachers. We trust as they become known many more of our readers will enter their names and send in answers. The marks will be published at the end of each quarter, and three prizes awarded.

In another column we publish a very interesting letter from Mr. Alfd. Cornish, of Melbourne, giving the result of his experiments with regard to the "actinic power of light in the tropics." The table which he gives will be of much service to many who may practise photography in the tropics.

THERE are rumours afloat that one of the outcomes of the recent photographic exhibitions held in Edinburgh will be the formation of a Scottish Camera Club, restricted to amateur photographers. We have already expressed strong opinions upon the necessity for an amateur society or club in Edinburgh, and feel assured, from the very hearty reception that we received at the "at home" given by us last November, that there are many of our subscribers who would support the Scottish Camera Club if formed. We shall be pleased to publish any letters upon the subject.

"AN Amateur Photographer" has sent us a reply to the letter from Herr C. Srna, President of the Vienna Amateur Club, and although we have no wish to take up sides, it does appear to us to be most unreasonable to have a jury of selection, and no declaration that the whole of the work in connection with the production of the photograph has been done by the sender—"exposure, development, retouching, printing, toning, and mounting." Without such a declaration no jury could accept the work. It may not be known to Herr Srna that such is the uniform custom at all exhibitions and competitions here, or at least the rules provide that the whole of the work must be done by the exhibitor. Our own form of declaration is well known, and here it is:—

"I, \_\_\_\_\_, of \_\_\_\_\_, hereby declare that I am an amateur photographer, that the photographs sent by me are my own unaided handiwork, the selection of subject, exposure, development, retouching (if any), printing, toning, and all other operations having been performed by me."

Many hundreds of amateur photographers in all parts of the world have subscribed their names to this declaration, and we have never found that Herr Srna's opinion that they "considered a passage requiring an express declaration as to how much of the work the exhibitor himself has done to be a degradation, nay, well nigh an insult, for amateur and professional alike." We have all through the piece been hopeful that the Vienna Exhibition would be a model one, and one from which the promoters of exhibitions here might learn something; but if the jury of artists are going to accept photographs from Austrian amateur photographers without question as to how or by whom they were produced, then we heartily hope that our voice of warning will result

in English amateurs withholding photographs which are entirely their own work, and should therefore not be placed in competition with work exhibited by those who have only uncapped the lens or, possibly, developed the negative. As to professional work, it is no concern of ours. So long as a professional photographer employs an operator to take the picture, another assistant to develop the plate, another to retouch, another to print and tone, and yet another to mount and frame, so long, we consider, he should not be allowed to compete with the amateur photographer; although it is a remarkable thing that in the case of the exhibitions of the Photographic Society of Great Britain, the amateur generally holds his own against the professional, notwithstanding the army of workers the latter employs in producing his exhibits. When, as in the case of the competitors for the *Photographic Reporter* medals (restricted to professional photographers), he signs a declaration framed almost identically with that quoted above, then he may hang his pictures side by side with those of the amateur, and they can be judged on equal grounds.

It appears to us that the Vienna Club have been thoughtless in regard to the rules governing their exhibition, and have not really considered how easily, without properly drawn up rules, exhibitors could evade that which we in all honesty believe the Committee intended to be a condition, *i.e.*, that the photograph should be the work of the sender.

THE Manchester Amateur Photographic Society have, through their members, says their organ, the *Photographic Record*, within the last six or seven weeks gained eight medals in recent competitions, and of these five are for work contributed to the AMATEUR PHOTOGRAPHER competitions:—

Lantern Slides :	J. W. Wade	..	Gold Medal.
	Dr. Jumeaux	..	Gold Medal.
	W. H. Shirley	..	Silver Medal.
Stereoscopic Slides :	Dr. Hamilton	..	Gold Medal.
Enlargements :	T. Shaw	..	Silver Medal.

If these awards give pleasure to the society as a body, the members may rest assured that we are highly gratified to find that our competitions are so well supported and our medals so valued by the members of one of the largest and most influential photographic societies in the kingdom. We have been asked by the society to visit Manchester in March, and shall have the pleasure of showing the 1890 Prize Lantern Slides on the evening of Tuesday, the 10th prox., and shall also show them, by invitation of the Committee, at the Liverpool Photographic Exhibition on the evening of Wednesday, the 11th prox. We look forward with much pleasure to both these evenings, as they will afford us an opportunity of making the acquaintance of many who do not as yet know us in the flesh.

MAJOR J. F. NOTT will deliver a lecture on "Wild Animals in Captivity," illustrated by the optical lantern, on Monday, the 16th inst, in the Lecture Hall, Hill Street, Richmond. The Secretary of the Richmond Society, Mr. E. G. Richardson, 20, Hermitage Road, Richmond, will be glad to forward tickets, price one shilling each. The proceeds, we understand, will be given to the Richmond Hospital.

THE 1890 "Prize Slides" have been shown at several places lately, and they appear to give the most general satisfaction. The Secretary of one society writes: "We have to thank you for the pleasure afforded us viewing so grand a set of slides; the best we have had the

pleasure of seeing." We are sure that the pleasure afforded to hundreds of people by the exhibition of the AMATEUR PHOTOGRAPHER Lantern Slides must be as gratifying to prize winners as to ourselves. We are only the middlemen, but they are the producers. We hope this year's competition, whilst losing nothing in interest for the competitor, may have more interest for the lay public, and we shall hope by the end of the month to have rules and conditions ready.

THE contents of this month's *Photographic Reporter* are published in another column. We have heard it said that this month the frontispiece alone is worth the money. Our advice is, buy it, and then write and tell us what you think about it. Our publishers have made arrangements that the *Reporter* shall be on sale at all the principal bookstalls of Messrs. W. H. Smith and Sons. If any of our readers find any difficulty in securing copies either at the bookstalls or photographic dealers', will they please communicate with the publishers?

THE President of the Croydon Microscopical and Natural History Club, Mr. Lovett, has, we understand, "at his own expense and trouble, presented a dark-room and laboratory to the photographic section of the club for the coming year. The room is some 25 feet long, and has every convenience, including a permanent screen, etc., etc." We are glad to find that Croydon is able to support two societies. The Croydon Camera Club has certainly set the older society a good example.

WE have just received the full prospectus of the Crystal Palace National Photographic Exhibition, April 13th to May 2nd inclusive. Last year the attendance exceeded 41,000 a week. The alcoves are this year to be placed in the nave, where the screens will also be arranged. A gold medal is to be given for the best alcove, and a silver medal for the best complete screen. We are glad to note that the classes for amateurs and professionals will be kept separate and distinct. This must be, unless the work is entered under identical conditions. A special class is to be devoted to the work of lady amateurs, and a silver medal will be awarded for the best picture.

We are pleased to note that the "grand challenge cup" for the best collective exhibit by a photographic club or association will be again competed for. We consider that societies should support this competition, and we hope to see a very fine show of photographs entered by societies. There should be at least fifty societies who could send a collective exhibit. "The number of pictures shall not be less than fifty or more than one hundred, of which a maximum of one-fourth shall be the work of professionals"—provided always, we suppose, that the society admits professionals as members? A Champion Class Competition will be inaugurated for the first time. The rules provide that "two gold medals will be awarded, one for portraits or groups and one for any subject not being a portrait or group, which at any time during 1889, 1890, or 1891, at any public exhibition in the United Kingdom, shall have been medalled either singly or in sets. Entire sets must be sent in, and all particulars of previous awards must be stated on pictures or frames." Applications for entry forms should be sent to the Crystal Palace Company, Sydenham, S.E., or we shall be pleased to forward copies to any of our subscribers.

WE heartily congratulate the Croydon Camera Club upon the marvellous progress it has made. We cannot remember any other provincial society which, in less than twelve

months from its foundation, has had as many as seventy members elected. Such, according to the first annual report, is the case. We also note that there is a substantial balance of assets over liabilities, and a valuable addition to the executive secured by the election of Dr. H. J. Strong, J.P., as Vice-President.

PORTOBELLO wants a photographic society—so writes Mr. W. W. Ritchie, of 10, Wellington Street, in that town. Perhaps some of our subscribers will help him to form one?

MENTION was made last week, in the article "Round the World with a Camera," of negatives being broken. Our attention is called to the matter by a correspondent, who says, "Why do not the manufacturers of these boxes make the grooves of india-rubber with a flat piece at the bottom?" We suppose the chief reason is that the public will not pay for them. We should advise anyone going abroad to have special boxes made on the model of the very excellent slide-boxes made by Messrs. W. Watson and Sons, High Holborn, in which the slides rest upon two india-rubber tubes at the bottom, and have india-rubber at the top which presses upon the top of the slide; the boxes are not grooved, but they travel safely any distance. In designing the box for the 1890 Prize Lantern Slides, which Messrs. Watson made for us, we have india-rubber at the bottom and thick felt on the top, which keep the slides perfectly steady. We have no doubt that the firm would make negative boxes on the same lines as either of those mentioned.

WITH regard to a paragraph that we published having reference to copyright in Father Damien's portrait, our attention is drawn to the matter in a letter, in which our correspondent says that "the author of the original sketch, I believe, took no proceedings, but the photographer who reproduced his sketch, and had registered the photograph did. . . . The photographers, the owners of the copyright in the photograph, did threaten some proceedings, and I believe did obtain some small damages, but in one case which came under my notice the proprietors of a newspaper that reproduced a photograph of Father Damien repudiated the alleged infringement of copyright and defeated the plaintiff with costs." We are sure some of our readers will be interested in the above, and we have to thank our correspondent for putting us right in the matter.

**Photography in France is Forbidden to "Strangers."**—If an artist is observed in the act, the nearest "gendarme" or "gardien de la paix," has a right to remove him to the police station, where probably his goods will be confiscated and himself greatly inconvenienced, before he once more emerges, a wiser but a lighter man. To avoid this, the little trouble of obtaining leave had better be gone through. If you cannot present yourself at head-quarters, then obtain and send a passport to the Chef du Génie of the nearest fortified town to where you intend practising the art, asking for leave to photograph, etc., and enclose a reply stamp to ensure notice being taken of it. This will probably produce a formal letter authorising you to photograph for a specified time (which it is better to name yourself in the first letter) in the district under that fortified town. But this is not all. The General Commandant has to put his stamp, and so send this reply to M. le Général Commandant of the same town as above; he will stamp it, and leave is then complete. To think that an English Consul can obtain leave for you is an error. He cannot now. It was so once. The best mode is to present yourself, if possible, to the officers named, with either a passport or a Consul's letter of introduction. The French officers are most polite, and very ready to do you this service, if you will look upon it as a favour from them to you. "Continental" Bradshaw gives you the names of all Consuls and Vice-Consuls in Europe. Postage to France is 2½d. ½ oz. In France 15 c. 15 grms. A passport once obtained is useful for life, and often obtains admission to Continental buildings at hours when they are closed to the public or never open at all.

## THE ART GALLERIES AND THEIR TEACHINGS.

We have in several articles dwelt upon the value of the study of the best works of our landscape and figure artists as an aid to the photographer in producing results which in their own particular line shall be worthy of the name of pictures. We desire now, in some sort, to sum up the teaching which we have endeavoured to inculcate, and this as shortly as possible, laying stress on but two or three points of primary importance.

At the outset, then, we would say that the choice of worthy subjects is the first step towards attaining any true and consistent excellence in the direction of artistic photography. We plead for greater thought and greater care in the selection of objects or scenes to be photographed. We can see, indeed, but slight chance of distinction for that class of worker who with proud glee announces that he has exposed all his dozen plates or worked through a spool of film, and that "they have all come out nicely," meaning thereby that all his negatives have turned out clear and sharp; this from a purely photographic point of view may be eminently satisfactory, yet from an artistic standpoint those twelve plates may be as valueless as if they were all hopelessly fogged. There is an end beyond that of purely scientific success, and that end is to create, so far as the means at our disposal permit, a photograph which upon the eye of the spectator shall produce the same sensation as the scene itself presented to us when Nature herself spread it before our gaze. We maintain, then, that the want of cultivation of the faculty of selection is in the first instance the cause of the failure of so many photographs from an artistic point of view. Moreover, there are two distinct ways in which this faculty of selection must be judiciously exercised—attention must be paid in the first instance to the actual material objects to be included in the picture and to their arrangement; and secondly, a careful study must be made of the lighting best suited to those objects when selected. Success in both these stages of picture-making depends, not on the apparatus, which can afford no help, but entirely upon the individual taste and the æsthetic faculty possessed by the photographer. That in itself is an answer to those who would dub photography a merely mechanical contrivance, since if that element of artistic individuality once enters into the composition of a photograph, then it becomes something more than a mere "topographical representation."

This faculty of selection, how is it to be obtained? It may be said that if it exists it is innate—it cannot be acquired. That, we think, is only true up to the point that it must be conceded that, like every other faculty, it is very much a creature of circumstances, and where circumstances have not called it into play it may yet exist, though dormant. And here is another good reason for encouraging the study of artistic photography as a means surely of developing the dormant æsthetic faculty, by pointing out to its votaries the comparative insufficiency of photography, merely scientifically considered, to satisfy the higher instincts, and to press home the truth that it is the more spiritual or artistic side that should be assiduously cultivated as a powerful ameliorating influence upon the world at large.

If, then, this faculty is able to be acquired, how are those in whom it is dormant to cultivate it? Firstly by the study of Nature herself in her own haunts as she discloses herself in ever-varying forms of beauty to the eyes of her admirers. Here the student will learn the broad facts of nature, the effects of cloud and sunshine, of rain and storm. In her presence he should never let slip the opportunity of exercising his artistic faculty, and of forming his taste; the mental note-book of artistic appreciation should be ever open in his hand. Secondly, he must go to the great masters

of painting, and study their methods of arrangement and composition, try to appreciate their powers of selection, the motives of their work, and, above all, the subtle instinct by means of which that same sentiment which nature herself presents to them is brought home in their pictures to the eye and the mind of others. Therein lies the faculty of true greatness of style, because truth to nature, coupled with the faculty of artistic selection, results in the habitual choice of such subjects as appeal to the best sentiments of man's nature, and involve the widest interests, as opposed to such as are confined and petty in the lesson they would emphasize. True, in landscape the more closely nature is followed the more nearly will the artist succeed in telling nature's own story, but in the region of genre or figure study it is specially desirable that those who aim at real artistic excellence should appreciate what is true greatness of style. We have noticed in many genre studies, not a few of which have been awarded medals at our too frequent photographic exhibitions, that the motive is common-place, ridiculous, grotesque, or appealing to some interest purely personal—clever in its way, no doubt, but utterly wanting in any of the higher qualities that should be the aim of the true artist. The representation of Nature as degraded by empty frivolities, or soiled by sordid vices, is not interpreting nature as Nature's Creator would have us interpret her; namely, as a step to raise us nearer to the sublime. In the Creator's Nature there is nothing frivolous, nothing sordid, nothing vicious, except what is the outcome, or rather the excrescence, of man's sin, and so it comes about that those who dub themselves naturalists are often most incorrectly so called, since they have failed to distinguish, amongst the mass of material put before them, the true Nature of the Creator, from the false and debased Nature of the creature, and in the selection of their subjects appeal to the lower rather than to the higher passions of the spectator. In pure landscape this danger, of wrong selection, and of want of nobility in the choice of subjects, is not so great, but another danger awaits those painters and photographers who fail to study the truth with care—the danger of untruthfulness in the conception and rendering of space; and here we approach the question which has lately excited so much correspondence in the photographic journals as to the relative value of sharpness or of blurring in the focus of the distance. If for the selection of subjects and for breadth and nobility of style the photographer artist is to go to Nature first, and then to her best interpreters amongst the painters, where is he to find a method which will enable him to reproduce in his pictures the subtle, all-pervading sense of atmosphere which gives the idea of space to a truly artistic work? The painter attains this object by means of the powers he wields in palette and brush, by means of opposition of tones and so forth. This the photographer, in his study of the question, must not overlook; but it will hardly help him much. There is, however, another method—and a truer one—for obtaining the same result, which we cannot but notice in the works of our great landscape artists—Turner, for instance (and of our moderns, especially D. Murray). As Ruskin has said, "The idea of space is more clearly indicated by the *drawing* of objects, the degree in which their details and parts are distinct or confused, than by the relative tones of the objects."\*

What, then, is the sort of drawing that we require? To answer this we must go again to the great landscape painters. We photographers are told by one school of enthusiasts that we should have all the planes in our pictures sharp, and by another school of still greater enthusiasts that every object but the principal one should

\* "Modern Painters," part ii., sec. ii., chap. v.

be intentionally put out of focus. During the time that the controversy has continually raged on this subject since the issue of a work called—wrongly, as we think—"Naturalistic Photography," we have always held our own opinion. It is perfectly true that "objects at unequal distances cannot be seen (distinctly) together, not from the intervention of air or mist, but from the impossibility of the rays proceeding from both converging to the same focus, so that the whole impression either of one or of the other must necessarily be confused, indistinct, and inadequate." Further, it must be remembered that the space which the photographer is going to occupy with his picture is infinitely smaller than that occupied by nature; therefore, it would be absurd to collect in that small space all the lines and patterns which are occupying nature's canvas. Yet there should be some definite indication of those lines—there must be no vacancy, no blank spaces; for "in art every space or touch in which we can see everything, and in which we can see nothing, is false." Let us remember that our pictures should "never be without that finish and fulness which no distance can render invisible and no nearness comprehensible." How, then, are we photographers to reconcile the apparent contradiction between indistinctness of lines without vacancy on the one hand, and confusion of undecided lines, which by no means annihilates detail, but rather serves truthfully to suggest it, on the other?

The first help that we shall find is in the judicious choice of the time of day in which to operate, as a French writer\* on this subject has pointed out: "It is evident that in the evening as in the morning the planes of nature, whatever may be their respective distances, accentuate themselves. If you attempt to render the sensation of air and of ambient sunshine in the middle of the day, you will get nothing better than a flat, meaningless result." We have, then, two practical hints to go upon—we must watch for the particular time of day, that special phase of lighting which, when reproduced by photographic means, will convey with it a truthful notion of the different planes of nature and the idea of space, whilst at the same time we must endeavour, by such means as are in our power, to modify the sharp drawing which our lenses as good optical instruments produce.

This latter, then, is the really difficult end to attain, and it has never seemed to us that it is to be obtained by putting either foreground or distance out of focus, according to whether we wish to draw attention to one or the other. If we compare the effect produced in the contrasting of foreground and distance in one of the pictures of Turner, or of East, Murray, Vicat Cole, or Leader, with a so-called naturalistic photograph in which the distance is intentionally put out of focus, we see that in the former it is not so much the indistinct definition of the lines themselves that produces the desired effect, but the breaking up of those lines—the incompleteness in the combination of the lines which make up the distance. It does not seem, then, that we photographers have any means in our power of so breaking up the lines in our negatives; it is beyond the power of our instruments, which can only enable us to obtain blurred or foggy editions of the lines, which still remain complete in their combination.

What then have we to fall back upon in order to obtain truly artistic distances? We have not the painter's powerful adjuncts in palette, in brush, and in skilful touch to produce those softening tones which seem to convey to the eye the identity of intervening atmosphere; but such tones as by various positive processes we are able to obtain, these we

should be ever ready to make use of, selecting that particular style of printing best suited to the subject. Then we must exercise skilful judgment as to the time of day, and the most effective scheme of lighting which nature provides for us, so as to watch for that time when the distances between the varying planes are most emphasized, thereby avoiding as far as possible the too great sharpening and levelling up which our lenses give us. And again, if we cannot truly break up the lines of our distance in our negatives, by careful printing it has often seemed to us that our best artist-photographers have approached a point in the skilfulness of rendering the varying distances with varying indefiniteness, which comes very near in effect to the result produced by painters in the breaking up of their lines.

What we plead for then is greater consistent care in the selection and choice of subjects and in the time of lighting, and more especially in the appropriate style and manner of the printing, so that we may hope, as a body, to rise to a higher level of artistic excellence, and refute the recently expressed opinion of an imperfectly informed leader-writer in the *Standard* who wrote about "all photographs being momentary reflexions of the mood which may have been accidentally presented to the unsympathetic lens." That is just the sort of happy-go-lucky method which we protest against when we insist on the cultivation of artistic feeling and individuality in our photographic work.

## Letters to the Editor.

### THE VIENNA EXHIBITION.

SIR,—The reply of Herr C. Srna, as President of the Vienna Amateur Club, to my letter, which appeared in your journal's issue of January 2nd, concerning the forthcoming Vienna Exhibition, deals at some length with some less important matters, to which I must refer only briefly. I made no comment upon the choice of the jury, as, although it may be open to criticism, I pointed out only that such a jury will not help a state of things, to criticise which was the chief object of my letter. I would further protest against the insinuation that I wilfully distorted a slip of the pen in the German circular, concerning the admission of professional work. It is certainly to be regretted—as you have pointed out already—that in a carefully arranged exhibition things should not be clearly stated, that slips of pen occur, and that there should be contradictions between the English and German circulars. It was in the presence of a few amateur photographers that—not speaking German myself—an Austrian gentleman translated the original circular, in which it was clearly stated "that professional portraits and landscapes are not admitted," and also a later circular (which I regret not to have at hand for quotation from the original), in which, on this point, an explanation was given, that only non-artistic pictures were implied under the title "professional portraits and landscapes." But the question of admission of professional work is not that with which I had to deal; I only wished to know whether in professional work also it was urged to be the entire work of the exhibitor, and I asked if it was to be exposed in separate classes or to compete with amateur work. In an exhibition which should be a model one, such important points, I think, should be clearly stated. I regret that Herr Srna has given no answer to this question.

My letter had one main object; it was a protest against the admission of work into a competition arranged by amateur photographers, which is not entirely the work of the exhibitor, viz, from the exposure, through development, retouching, printing, toning, and mounting, to the finished picture. In order to enforce this, I considered it my duty to direct the attention of English amateurs to this point.

And now let me most emphatically assert that my protest was not based on unfounded scruples which I have raised. A man must indeed be short-sighted to believe that the exhibition was contemplated on the basis which we urged should be accepted

\* Karl Robert, "La Photographie Aide du Paysagiste," p. 110.

and that the Committee, up to the appearance of my letter, held such views. Herr Srna actually asks us to believe that such a distinct and essential condition that the picture should be the entire work of the exhibitor, was pointed out neither in the conditions of the exhibition nor in the circular of invitation by one single word, because from the very first he deemed this a matter of course, because he considered "that a passage requiring an express declaration as to how much of the work the exhibitor himself has done as a degradation, nay, well-nigh as an insult, for amateur and professional alike." How can Herr Srna expect that such an explanation shall be accepted? Was the first exhibition, which he arranged about two years ago, based on such principles? Far from it. Has it been the general custom in Austria, or even in Germany, in photographic exhibitions? No. Is Herr Srna unaware that there are yet photographic exhibitions where such regulations are not imposed upon exhibitors, or where they are only partially required? And in consequence how can Herr Srna expect that the photographic public, to which he addressed his invitations, will know and correspond with conditions which are not mentioned in his programme? Herr Srna has now *trop de zèle*, when he considers it even "an insult to amateurs and professionals alike" in clearly stating the conditions of the exhibition. In the form to be forwarded to the Committee for application for space, not a single word on this point is contained, and no declaration whatever is asked from the exhibitor. Can Herr Srna deny that there are still photographers who do not share the views he held secretly, or who cannot comply with them? By what means then, in the absence of such conditions clearly stated, and the declaration of the exhibitors that they agree to abide by them, did Herr Srna expect to decide whether the pictures sent were really the entire work of the exhibitor?

No, the revelation Herr Srna suddenly made is too astonishing and ingenious to be believed.

But Herr Srna now goes even further; he exclaims, "Experience and the most extensive (!) technical knowledge must go hand in hand with artistic perception to achieve what is called art in photography, and therefore we almost feel ashamed of asking the competitor how much of it he has done himself." *Quelle pruderie!*

How can Herr Srna make me and others believe that he is so orthodox in this respect, that to ask how much of the work the competitor has done himself "is a shame," when, at the Vienna Exhibition he arranged in 1888, no question whatever about the workmanship in the pictures was made, no condition whatever on this point prevailed, a great many pictures were exhibited, and decorated with the highest distinction, in which the exhibitor, at the utmost uncapping the lens, was the spectator of the work which others had done; when, besides this exhibition, famous in this respect, only last year there were two exhibitions, one held in Frankfort, the other at Budapest, at both of which not the slightest restriction concerning the admission of pictures was made, and when both these exhibitions were patronised by the Vienna Amateur Club, and in both exhibitions part was taken by the Vienna Club as a body, under the leadership of its President, Herr C. Srna, and by members singly, even by Herr Srna with his own pictures, which also had their share of the shower of medals, which Herr Srna duly accepted.

I think this is enough. My first letter had only one aim, to speak in the interest of amateur photography, of which I am an ardent admirer, to speak in the interest of the Amateur Club of Vienna, which I hope to see flourishing and gaining that position which in time, no doubt, it will be entitled to hold. But I felt compelled to defend my own good faith. I should have been very glad if Herr Srna could have given in with a simple "peccavi" or even without it. He has not done so! His last sentence, "on the harmony of English and Austrian photographers," is wholly unnecessary; no international conflict was in view, and it was only intended to interfere with a clear, impartial judgment of the case and to create a partial feeling against your correspondent.

Never has it been so clearly proved that opposition, although often an ungrateful task, is of value in public matters. It is rather a matter for astonishment that I, a humble worker in photography, have been able to drive the whole committee of this exhibition to such straits, although I know that the chief merit lies in the standing of the journal in which my letter appeared and in the support which my opinion received.

The Vienna Committee—when it has now changed altogether

its standpoint to which I am the first to congratulate it—should once more state clearly the conditions of the exhibition, and *not be ashamed* to point out that the whole work—exposure, development, retouching, printing, toning, mounting—must be the exhibitors' own work, and should, therefore, require from exhibitors a declaration that they comply with these conditions, even now, as already the time for entries is over, as without that the whole announcement will remain a delusion. The Committee should try to give a keen eye to see that such conditions are fulfilled, and then Herr C. Srna will have no more thankful and obliged servant than

AN AMATEUR PHOTOGRAPHER.

#### LANTERN EXHIBITIONS.

SIR,—It recently fell to my lot to exhibit the lantern slides at our society, and possibly the results of my experience may render the task more easy and satisfactory for others in a similar position.

I was using bags and mixed gas jets with a biunial lantern in a very long hall, so that with 14 in. focus lenses we had about a 16 ft. disc, and it was very difficult to get light enough for even moderately dense slides.

My first trouble was that my assistant had reversed the gas tubes, and hence the bye-pass being on the oxygen side, on attempting to dissolve, the second lantern was always extinguished. I got over this difficulty by using only one lantern. Moral—always see that the tubes are properly connected yourself, and that the dissolving tap works properly before uncapping the lenses. Next the slides were to be announced from the platform before their appearance. Though I myself was the author of this system, I see that it is certainly wrong. If possible, they should be announced by their author as soon as they are on the screen, as no amount of care will avoid mistakes either by the reader or the exhibitor.

Again, the slides, being by many different workers, were marked in various ways, one series, indeed, being without any indications, and amongst the latter were several marine and aquatic scenes in which reflections were so perfect as to make it a matter of guess by the dim light available as to which was the right way up. I would insist most strongly in future that every slide for exhibition should be marked in accordance with the well-known rule—two spots at the upper corners of the film side—and would further suggest that if a light-coloured mask be used, these spots should be of a conspicuous colour upon it. If they were put under the cover-glass, they would not be liable to get detached, an accident which may occur in much-handled slides. I found that this had occurred to many of the AMATEUR PHOTOGRAPHER prize slides when recently showing them, although I believe they were all properly marked when they started on their round. They formed, by the by, a most excellent collection, and gave us a delightful evening.

Lastly, "gentlemen are requested not to talk to the man at the wheel"—I mean at the lantern. The exhibitor has quite enough on his hands without the advice and still more the assistance or interference of well-meaning but troublesome friends. If he wants help, let him call for it, and if he is using bags have plenty of weights on them; it is easy to reduce pressure at the burners, but a half-filled bag will not give nearly the same pressure at the jets as a very distended one when equally loaded.

This is all, no doubt, stale advice, but I wish I had had it impressed on me a week ago.

A COMMITTEE MAN.

#### DR. EMERSON'S RENUNCIATION.

SIR,—There are one or two matters of public interest in Dr. Emerson's eccentric "Renunciation," and one or two requiring personal reply, which I should like to refer to briefly. It would be waste of time to take this undignified production too seriously, for it is evidently only the outcome of violent egotism and offended vanity.

First, do not let photographers suppose that Dr. Emerson has the right to claim any originality in regard to naturalistic art. He has merely adapted to photographic methods ideas current amongst certain artists. He is, therefore, neither entitled to claim further recognition than this, nor has he the slightest right or power to order the funeral of naturalism in photography. Secondly, the limitations of photography are not so great as he now, for vindictive purposes, wishes to make out, for the individuality of the worker is freer than he asserts, and he has allowed

himself to be misled by an absurd confusion about Messrs. Hurter and Driffeld's experimental results. The power to alter relative values by exposure, development, and other purely photographic means is infinite. Thirdly, if "all writings and opinions upon art are as the crackling of thorns," why does Dr. Emerson return to his vomit in this pamphlet, and re-discuss certain art matters; and why, in the name of all that is consistent, does he threaten photographers with another book on art later on? Fourthly, what on earth has "the dexterity" of the man with paint and brush to do with the matter? The photographer's dexterity as an artist is *not* a matter of a few weeks. It takes as long as the artist's to cultivate. It is a mental training, and the handicraft follows the brain. Fifthly, Dr. Emerson is wise to give up every "school" title and to take to admiring "all good artists and all good art." It is what every sensible person has always wished to do, and after passing from one violent extreme to another, we may hope he will in time reach a reasonable medium. Sixthly, I believe it to be false that anyone has claimed novelty in the use of rough papers. All the same, these pictures have spoken and will speak for themselves to those who are less amateurs than Dr. Emerson, who has, "by the sweat of his brow, learned under a master!" Long before Col. Noverre's excellent specimens were exhibited, I, and probably many besides, had spoken to Mr. Willis and others about the necessity for such rough-surfaced papers. Seventhly, the fact that Dr. Emerson should have left the Camera Club cannot fail to make that institution more attractive and comfortable to all reasonable and sociable people. Eighthly, Dr. Emerson's repudiation of the claims of photography as a means of capable artistic expression is, perhaps, only natural. In my opinion there is something sadly wanting in most of his photographs, and he himself is probably now finding this out. I trust he is devoting himself to some other pursuit more suited to his abilities—a humorous friend of mine suggests fretwork.

In regard to the personal matter, and what Dr. Emerson calls my "superficial knowledge," I shall be well pleased to let my photographic pictures speak for themselves, and stand side by side with his, before any competent and unbiased judge. The quotation used from my private letter seems to me to read in refreshing contrast to the rest of the pamphlet. Dr. Emerson was anxious *at that time* to recognise what I had done for naturalistic photography. I was not, however, particularly anxious to be very closely identified with Dr. Emerson and his violent aggressiveness. A little of the same appearance of modesty would not injure him. The whole of this business appears to have arisen first in that I dared in a very appreciative criticism to point out Dr. Emerson's weakness in respect to treating figures in photographic pictures. In reply to that he wrote: "You are wrong about my figures; they are as yet alone"—a sweet bit of Emersonian modesty. From that time, although treating with me to write for a journal he proposed to start which was to knock everything else endways, he seems to have begun to say hard things about me to others. That I should have ventured to differ from him in respect of the qualities of diffraction photographs caused him further attacks of spleen, and, finally, the fact of my being invited to read a paper at the Society of Arts appears to have upset the whole of his years of study on naturalistic photography, and wrought him up to the pitch of fulminating this mad prophlet. The letter which he calls an "expostulation," and to which I sent no reply, was one long violent insult, alternating between threats and wheedling. I simply allowed Dr. Emerson to stew in his own bile. I was too busy to disturb myself with bandying insults.

As to the unfairness he complains of at the Society of Arts, he does not mention the name of the friend whose speech was misreported. It can hardly have been Mr. Maskell or Mr. Newman, and they were the only speakers who *read* their speeches. All the reports seem to me to be fairly accurate so far as they go.

Finally, I do not wish it to be supposed that I do not sympathise with Dr. Emerson in his affliction. There are some grains of sense in the pamphlet, more, indeed, than could be expected from anyone even with a good liver after three and a half months' solitary study in a house-boat during the recent weather. But every reader ought to be cautioned against paying much heed to the outbursts of one who is blown about by every wind of doctrine—now a well-expressed word of a "great painter," now the influence of a common everyday artist, and now a misunderstanding of a scientific experiment. Give such an one three and a half months' further confinement in a house-boat and

a fresh quarrel, and a new crop of theories or burning thereof may be expected. It is certainly to be hoped that no photographer who is working out his own salvation by serious study and practice will be deluded by such cheap trash as this pamphlet contains. Let Dr. Emerson cast all the copies of "Naturalistic Photography" upon the dust-heap; let him, as I think, wisely, succeed in covering up the crude and absurd directions "To the Student" in every one of the volumes of "East Anglian Life," which, with his genius for advertising himself expensively, Dr. Emerson sowed broadcast over the country—let him do all this and go on "renouncing" to the crack of doom, and he will only publish his own vanity, and will not be able to stem the tide of advancing culture amongst photographers.—Yours, etc,

London, February 2nd, 1891.

GEORGE DAVISON.

#### TO DR. EMERSON.

SIR,—As a brother photographer I cordially return your salutation. I am not among those who, you say, have been "misled" by you, neither have I ever harboured feelings of enmity against you or your dogmas. Your expression of respect for those scientific followers of our craft you name will meet with cordial response, but why, oh why, should no admiration, respectful or not, be accorded to the men whose productions have given real "æsthetic pleasure" to the photographic world, such men as Gale, Robinson, Gibson, and others? With regard to the soft general diffusion of outlines in Mr. Davison's recently exhibited pictures, I must confess that, if those works are a faithful exposition of your teaching only, I have not read you aright. These works have commanded attention and compelled admiration, and I admit that I judge of a man more by what he produces than by what he has preached, and if this be the general view small wonder that societies have given attentive hearing to the last-mentioned gentleman's disquisitions on theory. Much has been said over and over again on the question of the relative claims of painting and photography to rank as art, and though I would like to add a few words on the point this is not the time.

Certainly no sane man would compare a photograph with, or rather would elevate it to equality with, the beautiful handiwork of a modern painter, yet your wild strictures on photography as an artistic method of reproducing nature are, justly, to be severely condemned.

Photography, while, may be, it is an assistant to artists, is not merely a "handmaiden" or servant; it is nearer the mark to say it is a teacher, in competent hands it is a beautiful expositor of nature and a good medium for exhibiting a man's artistic taste. Your witty but caustic epitaph will certainly amaze many, as it has me, though its literal truth be questionable—but there! it is an epitaph. There are many, possessing, like myself, a great liking for pictures of beauty, who will still endeavour to produce them by means of photography, and will continue the practice of their favourite hobby as heretofore, quite oblivious of the facts that naturalistic photography lived, died, and was buried.—Yours, etc.,

A. B.

SIR,—In this week's AMATEUR PHOTOGRAPHER there appears a wonderful proclamation to the photographic public, that will doubtless throw the camp of the Fuzzites into terrible confusion, and bring many a good photographer to an untimely grave, by causing him to indulge in an uncontrollable fit of laughter.

The trusted leader, the mighty champion who never required the assistance of a trumpeter to help him in proclaiming his own infallibility, the man who was never wrong, the man who could not learn but only teach, this man on whom the Fuzzites had pinned their faith and whose banner they followed with proud delight, has deserted his devoted followers and left them to get out of the quagmire into which he had led them as best they can. Truly, this is a calamity! How can the poor amateur, who has been reading columns of letters and articles on photographic art till his poor head felt in a whirl, how can he, I say, survive this irreparable loss? For I venture to say that

Take him for all in all,

We shall not look upon his like again.

But what has Dr. Emerson done? Seeing that his wild and erratic views found no favour with moderate and intelligent men, he has thrown the whole thing up in disgust, like a spoilt child that breaks his toy and goes away howling with rage and passion. But he does not content himself with retiring quietly from the field; he turns about and pours forth the full volume of his wrath on the devoted head of his former love, Photo-

graphy; accuses her of being unable to be artistic, unable, in fact, to produce a picture. This I venture to totally deny. Because Dr. Emerson owns that he, "even" he, cannot produce a picture it does not follow that there are not other men who can do, and have done, so, although it is possible they have not made quite such a parade of their works as he has done. Such men as Robinson, Gale, and others have produced pictures, and real pictures too, and they will continue to do so, despite the dismal croakings of this ex-realistic raven.

What I object to is—not Dr. Emerson's retirement from the ranks of artistic photographers, but that he should undertake to tell us there is no art in photography, when he has just an instant before virtually admitted that he does not know anything about it. This is really too much, and were it not for the fact that he himself tells us that he is "saner than ever," we might be tempted to think otherwise.

We shall all look forward with interest to the time when the new Emersonian Koran shall appear; meanwhile it will be interesting to see how his former followers will like being called "charlatans, photographic imposters, pickpockets, parasites, and vanity-intoxicated amateurs."—I remain, yours faithfully,

ILSLEY R. CODMAN.

\*\*\*

#### ACTINIC POWER OF LIGHT IN THE TROPICS.

SIR,—I send you herewith some actinometer readings recently taken during a voyage from London to Melbourne. The idea was to prove for myself the variations in the photographic power of light as the equator is approached. The ground had previously been broken by Mr. O'Farrell, who experimented between London and Aden, and, in an article contributed to the *British Journal of Photography* a year or two ago, he states that the light at Aden (about 13 degs. north latitude) in September is twice as actinic as the best June light in England. This is contrary to the opinion I had heard expressed more than once, viz., that tropical light is less actinic than June light in England, and my own very slight experience appeared to confirm this opinion, for a few snap-shots I once took at some diving boys at Aden certainly did seem to require a lot of persuasive coaxing before yielding sufficient detail.

The following are my results, which were obtained with a Stanley actinometer, freshly charged by the maker just before starting, and kept in an air-tight despatch box when not in use —

Date.	Place.	Position.	Hour.	Actino- meter Reading in Seconds.	
				Sun.	Sky.
Oct. 2	London (Pall Mall)	Lat. 52 N. ...	1 p.m.	13	13
" 5	Centre Bay of Biscay	" 46 N. ...	10.30 a.m.	1	1
" 7	Gibraltar ...	" 36 N. ...	Noon.	1	3 1/2
" 11	Malta ...	" 36 N. ...	Noon.	1	3
" 14	Port Said ...	" 31 N. ...	1 p.m.	2 1/2	2 1/2
" 20	Aden ...	" 13 N. ...	Noon.	2 1/2	2 1/2
" 29	At sea ...	Equator. ...	Noon.	2	2
Nov. 1	" ...	Lat. 13 S., long. 95 E.	11 a.m.	2	2
" 4	" ...	" 26 S., " 107 E.	Noon.	1 1/2	2 1/2
" 7	Albany ...	" 35 S., " 118 E.	Noon.	2 1/2	2 1/2
" 13	Melbourne ...	" 37 S., " 145 E.	Noon.	2 1/2	2 1/2

\* Full.

Although the Pall Mall reading was taken with the sun shining out of a cloudless sky, there was the faintest suspicion of haze, and as October light at noon in England is generally reckoned to be about half as actinic as the best June light, I reckoned that at noon in June this actinometer would have darkened in three-quarters of a second; and if Mr. Stanley's papers are of unvarying sensitiveness this reckoning would be correct, for readings taken in June at Torquay before the instrument was recharged gave this result.

The conclusion that these experiments point to is that within the tropics at noon, any time of the year, light is 50 per cent. more actinic than in England at noon in June.

In all cases the time was taken by estimation. This may sound rather rough and ready to many of your readers, but any of them who have done astronomical transit work can assure the sceptics that it is very easy, with a little practice, to count seconds and parts of a second.

In the case of the readings for Gibraltar and Malta, three quarters of a second was too little and one second too much, so the difference was split.—Faithfully yours,

Melbourne, December 27th, 1890.

ALFRED CORNISH.

#### ARISTOTYPE PAPER.

SIR,—As queries frequently occur in your columns—two in the current number—respecting this paper, I would like to say a word thereon, although it has all appeared more than once already, as, whether by good luck or good guiding, I have escaped some of the pitfalls into which others seem to have fallen.

First, as to toning. I think a good many difficulties have arisen from the mistaken (at least, I think so) idea that it is economy to keep the toning bath and use it repeatedly. If you are working regularly every day, it is all very well, but how many amateurs do so? As a rule they tone a few prints to-day, and, may be, not again for weeks: meantime the bath has time to play all manner of tricks, such as precipitation of the gold, etc., etc. Ten or twelve ounces of toning solution—enough for a dozen half-plate prints—is value for about twopence; it is carefully put by, and when next wanted proves useless, but this fact is not discovered till perhaps another dozen pieces of paper, costing eighteenpence, are ruined. So the account stands—profit on bath, 2d.; loss of prints, 1s. 6d.; balance on wrong side, 1s. 4d. Surely this is bad economy. My practice is almost identical for albumen paper and Aristotype, and is as follows: Borax, 1 oz.; water, 80 oz.; of above take 10 or 12 oz. and add 1 gr. gold. With this I can tone satisfactorily three 12 by 10 sheets, and then it goes down the sink. It is a great advantage to put the print, when just rinsed from the hypo, into alum; this entirely obviates the exceedingly troublesome tendency to curl at the edges. Other workers use the alum at an earlier stage. Sometimes, if the action is sluggish, a trace of fresh gold starts the bath off again as lively as before. I have never tried the sulpho-cyanide bath, much preferring the tones given by the borax, and have had a fair amount of success with it on Aristotype. I have not hit it off so well with Oclerotype. The same toning solution works admirably with albumen paper, but for it should be slightly warm, say 75 degs. This temperature would blister Aristotype all over.

As to mounting, the thin card used by professionals to back enamelled prints is much better than cartridge paper. When the print is squeezed on to the ferrotype and while quite damp, go over it with a strong starch paste, and having squeezed the card down to it, let all dry gently and peel off. For final mounting I find thin glue answers well if the mount be damped and all put under pressure for a few hours. I find the glue sets before I have time to lay the print down, but the mount being damp they adhere; when kept pressed till dry. If too much glue be not used, there is no fear of its oozing out.—Yours, etc.,

GREENWOOD PIM.

N.B.—Toning for Aristotype must be carried a good deal farther than for albumen.

**Madras Amateur Photographic Society.**—The fifth half-yearly competition of the above society took place on the 3rd December. The subject for competition was "A Study of Architecture," and the judges' awards were:—Large views—Silver and bronze medals, Mr. F. Dunsterville; certificate of merit, Mr. J. C. Hannington. Small views—Silver and bronze medals, Mr. F. Dunsterville; bronze medal and certificate of merit, Mr. E. W. Stoney; certificate of merit, Mr. C. Michie-Smith. Lantern slides—Silver medal, Mr. E. W. Stoney; bronze medal, Mr. F. Dunsterville. A special prize for best "Landscape" was competed for by eighteen views, and the prize was awarded to Dr. A. G. E. Newland. The total number of exhibits of all kinds was 110.

**Fry's "Naturalistic" Bromide Paper.**—The Fry Manufacturing Company have come to the front with a very rough surface—Whatman—bromide paper, which is most excellent for views of whole-plate or larger size. We have tried the paper, and find it very easy to work, and soft tones, almost equalling those of a platinum print, can be obtained without difficulty. For those who desire a rough-surface paper, and have not the time or desire to prepare it for themselves, the new comer will be found all that can be desired. Messrs. Fry, in their pamphlet on the subject, make a few sensible suggestions with reference to the paper, one of which we will quote:—"The paper does not suit every subject. Try it upon a suitable one to start with, and thus avoid disappointment. When finished, the print must be viewed and judged from a distance, say five feet or more, away. The effect and breadth is lost if examined at close quarters."

# Studies in Art for Photographers.

BY REV. F. C. LAMBERT, M.A.

## CHAPTER II.

AMONG the various terms used in connection with pictorial composition, perhaps the word *Balance* claims first attention.

*Balance* is applied to the direction of lines, masses of light and shade, degrees of interest, attaching to various parts of a picture, and to colour; with this last we have no concern.

First then with regard to the balance of lines. It is a matter of simple observation that when there are several prominent lines running more or less in the same direction, these lines convey to the mind an impression of movement (sometimes towards their direction of convergence). In

FIG. 1.

most cases this is an undesirable result. So that by way of counteraction some one or more important lines are required to be arranged to run more or less in a direction contrary to the first-named set. In fig. 1 the group of lines *a, b, c* are more or less in the same general direction, and by themselves give one an idea of a general tendency to "topple over" towards the right. The same may be said of the lines *d* and *e* towards the left. Observe the effect of covering over first one group and then the other; and note the effect of the two groups taken together, how these seem to compensate, counteract, balance each other.

Next take the case of curved lines in fig. 2. The two curved lines *f g, m n*, have their centre of curvature to the

FIG. 2.

right, or are concave towards the same direction. These two standing alone are unsatisfactory. Now reverse *m n*—i.e., cover it over for a moment, and let it be represented by *h k*.

Observe now that *f g* and *h k* are concave in opposite

directions, and appear to support, complete, or balance each other. Note also that the chords of the arcs (i.e., the dotted lines joining the ends of the arcs) are in all three cases more or less parallel. Observe now the effect of joining the curves *f g, h k*, end to end, and how this is infinitely

FIG. 3.

preferable to joining *f g* and *m n*. Hence the direction of curvature is a matter of first importance. All sorts of curious and interesting things have been said about Hogarth and the line of beauty—as, for instance, that the line of beauty was composed of two curves in opposite directions, and such that the radius of one part was double that of the other; and the former curve one and a half times as long as the second. Another view is that if any straight line, *A B*, fig. 3 be taken and divided into five equal parts (as at *c, d, e*, and *f*), then the line of beauty will have these lines, *A e* and *e B* as the chords of two curves in opposite directions, *A e* and *e B* being three-fifths and two-fifths of the total length from *A* to *B*.

All these matters are at present chiefly interesting as showing that there is a general consensus of opinion, firstly that two curves in opposite directions produce a satisfactory impression; and, secondly, that these curves should not be of equal length or curvature.

These two points are well worthy of the most careful attention, although they seem to have escaped notice in works upon composition and form.

The idea of stability seems to be closely connected with

FIG. 4.

what we have already termed balance. In fig. 4 the outlines may be taken to represent roughly two solid bodies seen in perspective. Leaving out the three horizontal lines which are common to both, in *P* we have six lines leaning over more or less to the right, in *Q* we have one line leaning over to the left. In both cases the centre of gravity is well within the supporting base, and possibly *P* is in fact the more stable of the two, yet the first idea conveyed by the contour lines is that *Q* is better as regards balance; this effect is no doubt, in part, at least, conveyed by the one compensating line above referred to.

No doubt many other instances of the balance of line will easily be found by the student. We may briefly sum up our results, and say that a group of (more or less) straight lines which tend in the same general direction, other than horizontal or vertical, seem to call for other similar lines, tending in a direction contrary to the first-named group. Be it observed, however, that these two sets of lines are very seldom satisfactory when they are at (or nearly approaching) a right angle. Secondly, groups of either horizontal or vertical lines (although not calling for compensating lines) usually convey an idea of tranquility or monotony; and sometimes an effect of cutting up the picture into

segments. Thirdly, that groups of horizontal and vertical lines together give a strong impression of solidity and rest.

The balance of curve may be observed in countless examples in animal and vegetable forms, especially in the bodies and wings of birds, curves of the human body, etc. In the plant world, almost any leaf taken at random will show the line of beauty either in its contours or veins and ribs, as, for instance, the outline form of the lily of the valley leaf and flower stem, the curve of the bell, etc. Balance of line and curve (using those words in the rough and ready sense) may be seen in almost any photograph of hilly or mountain district, and also in a more formal manner in those cases where man has had a hand in fashioning nature, *e.g.*, in cultivated and pruned trees, avenues, etc. It will be observed that where man shows his handiwork, it generally is painfully evident in a formal symmetry which is almost always *un-*, *i.e.*, *contra-* natural. Balance of line and form is observable in every direction among natural growths. Precise symmetry is comparatively rare, and it is chiefly observable in the parts of things rather than among several things.

With regard to the balance of light and shade, and interest of subject, these could only be illustrated by more elaborate diagrams, and therefore must be reserved. It will be sufficient for the present to say that balance of light and shade refers to the disposing of the larger masses of light and dark, in such way that their arrangements are generally conducive to the desired effect without attracting any attention to *too* much of one or the other at any one part. This is to some extent antagonistic to breadth; *i.e.*, excess of either may destroy the other; both of which are desirable in due proportion.

Balance of interest is in a similar way opposed to *concentration*.

The interest may be so concentrated that one only sees a small point or area, all else is felt to be superfluous. Or again the interest may be so cut up and distributed that there is no leading theme—no main idea or attraction. These features also will present themselves in various examples.

In some works also we may say that there is a something which, for want of a better term, we may call balance of sentiment, as, for instance, where a poetic sentiment is to be presented in two or more slightly differing phases in different parts of a work. The proper apportioning of the several phases requires a subtle and masterly division or balance, so that all the parts may be in true harmony.

(To be continued.)

## The Construction and Use of Photographic Lenses.

By CLEMENT J. LEAPER, F.C.S.,

Instructor in Photography, City of Dublin Technical Schools.

### CHAPTER III.

#### THEORETICAL PRELIMINARIES.

It will be convenient before proceeding to give any data, to explain the conditions which what we may call an ideal lens must fulfil, conditions all of which are, however, rarely realised in practice.

These may be stated as follows:—

- (1) The image on the ground-glass must be sharp.
- (2) The image sharp on the ground-glass must be capable of yielding a negative of equal sharpness.
- (3) The image given by the lens in its usual position, *i.e.*, with its plane parallel to that of the object, must not suffer

in sharpness when the lens is caused to make an angle with the plane of the object.

(4) The image must be capable of being received on a flat surface.

(5) The lines of the image must be in conformity with those of the object.

(6) The lens must not form an image of the aperture of the diaphragm on the ground-glass.

The non-fulfilment of these conditions is said to be due to (1) spherical aberration, (2) chromatic aberration, (3) astigmatism, (4) curvature of the field, (5) distortion, (6) flare spot.

(1) *Spherical Aberration*.—A lens used in the ordinary way is employed to obtain a diminished image of whatever is in front of it. To do this, the object is placed at one conjugate focus of the lens, and the ground-glass at the other, the former distance being much greater than the latter one. In mathematical language the object is situated at *infinity*, the rays proceeding from it being in consequence practically parallel. Now, in order that a distinct image shall be formed on the ground-glass, the lens must cause all rays proceeding from the object to converge at one and the same point, whether those rays pass through the central portions or through the margins. The only form of lens which would accurately fulfil those conditions is a parabola, but this form cannot be adopted in practice, for the following reasons. In grinding a lens as previously described, it is absolutely essential that the motion be irregular, *i.e.*, that the lens or pattern be moved up or down or to and fro and in a circular direction at one and the same time. If both pattern and lens remained stationary, the lens would possess a flatter curve than the pattern, owing to the fact that the velocity of revolution is greater at the margins than it is at the centre. To compensate for this, it is necessary to alter the axis at every instant.

But it is quite clear that this condition can only be fulfilled when both surfaces are spherical. If they were parabolic, or of any other form, they could only be ground into each other on condition that the axis remained unchanged throughout.

Practical considerations have then caused the spherical form to be adopted in preference to all others, and as in consequence marginal and axial rays no longer converge to the same point, the defect so introduced is called spherical aberration, being due to the spherical form of the lens.

It is easy to verify the existence of this defect by pointing a spectacle lens of short focus at the sun, so as to form an image on a piece of paper held behind the lens. Under these circumstances it will be found that the image will be surrounded by a halo of light. But if the lens be stopped down to about a fifteenth of its focal length, this halo will disappear, and the image will gain considerably in sharpness.

The reason of this has already been explained in my article on page 364 (vol. xii.), to which the reader is referred.

By repeating the experiment with lenses of different foci, but made of the same kind of glass, it will be found that the more curved the surfaces or the shorter the focus, the greater will be the aberration.

On the other hand, if two lenses of the same focus but of different material be compared, it will be found that spherical aberration is smallest in that lens which is least curved, *i.e.*, that made from the most refractive substance.

It follows from the last statement that it should be possible to construct a series of convex lenses having the same focus but showing spherical aberration in a varying degree.

Such a series of lenses is shown in fig. 1, the relative aberrations being indicated by the figures beneath each lens. With a concave lens spherical aberration still exists, but as in

this case the marginal rays are brought to a focus *nearer* to the lens than the axial ones, the aberration is said to be negative. The latter kind of aberration is conventionally represented by -, the former by +.

For similar reasons to those given higher up it is possible

FIG. 1.

to construct a series of concave lenses having the same foci, but of varying degrees of spherical aberration.

Such a series is shown in fig. 2.

A reference to figs. 1 and 2 will show how this aberration is practically corrected.

If, for instance, we combine *a* and *e*<sup>1</sup>, spherical aberration is completely corrected, but the refracting power being at the same time neutralised, the two lenses will merely act as a plate of glass with parallel faces.

If, however, *d* and *e*<sup>1</sup> are combined, refraction is again neutralised, but the combination will possess negative spherical aberration to the extent - represented by  $-4.5 + 1.071 = -3.429$ . But by grinding down *e*<sup>1</sup> so as to shorten its focus, a point will finally be reached by which the spherical aberration of the combination will be destroyed,

FIG. 2.

whilst since by altering the focus of *e*, we make its refractive power different to what it was before, the combination will now act as a lens, and bring rays to a focus at one point.

It will be seen from this that the correction of spherical aberration depends not upon the actual foci of the lens, but upon the relation existing between the curvatures of their surfaces.

The mathematical expression for the correction of spherical aberration is given thus in Herschel's "Light":—

$$O = \left\{ \begin{aligned} & -\frac{a}{c} \{ (2 - 2d^2 + c^3) e^2 + (c + 2c^2 - 2c^3) ef + f^3 f^2 \} \\ & + \frac{b}{d} \{ (2 - 2d^2 + d^3) g^2 + (d + 2d^2 - 2d^3) gh + d^3 h^2 \} \\ & - \frac{ab}{d} \{ (4 + 3d - 3d^2) g + (d + 2d^2) h \} \\ & + \frac{a^2 b}{d} \{ 2 + 3d \} \end{aligned} \right.$$

In which

*ab* = refractive powers of the two lenses.

*cd* = refractive indices of the two materials.

*ef* = curvatures of first lens.

*gh* = curvatures of second lens.

We shall learn further on how this complicated equation may be considerably simplified.

If two extremely fine dots, touching each other, are caused to form an image by means of a lens possessing spherical aberration, it follows from what has been said that the two images will overlap, *i.e.*, the two dots will be represented by two circles. And since any object may be looked upon as consisting of fine dots, or mathematical points, we have in the dimensions of the circle constituting the image of a point a means of measuring the sharpness of the image yielded by the lens in question. This circle is termed the *circle or disc of confusion*, and under average conditions it has been found that if it does not exceed one-hundredth of an inch the eye examining the picture at the distance of normal vision will see the disc as a point. Accepting then this definition, we may say that an object is in sharp focus when the diameter of the image of any point on it does not exceed one one-hundredth of an inch.

*Chromatic Aberration.*—It has been already pointed out that a simple lens acts as a prism, *i.e.*, disperses light as well as refracts it; in consequence of which the visual focus of such a lens does not coincide with its actinic one.

In order to understand how this aberration can be corrected, it may be necessary to remind my readers that the refractive index of a material is the ratio which the sine of a ray in air falling upon it bears to the sine of the ray passing through it. As, however, refraction is accompanied by dispersion, *i.e.*, since all the spectrum rays are not equally refracted, it becomes necessary to choose some special point

from which the refraction can be measured. It would not do to select any one of the spectrum rays for this purpose, since these occupy a considerable extent of surface, but fortunately the solar spectrum is interspersed by a series of dark lines, which serve as standards with reference to which dispersion and deviation can be measured. These lines, called after their discoverer, Fraunhofer, are shown in fig. 3. That chosen to measure refraction is the dark line D in the yellow, and we may consequently define the refractive index of a material as the ratio between the sine of the angle of incidence and that of the angle of refraction, both being measured at the D line.

The dispersive power or dispersion of a material might be measured by the length of spectrum which a prism made of it and having a certain angle would yield, but it is more

FIG. 3.

convenient to measure it by the difference between the refractive indices for certain pairs of lines, usually AD, DF, or FG.

(To be continued.)

**A New Toning Bath for Gelatino-Chloride Prints**—M. Bani recently suggested the following new toning-bath for gelatino-chloride prints:—Benzoate of soda, 20 grammes; caustic potash, 0.1 gramme; water, 450 c.cm. When dissolved, add solution of chloride of gold (1 in 150), 50 c.cm; shake well and allow to stand for two hours. The bath is ready for use when pale-rose-coloured. The tones given are similar to platinotypes.

## Photographic References.

BY MAJOR J. FORTUNÉ NOTT.

(Continued from page 60.)

### EXPOSURE.

AFTER the difficulties anent the focussing have been satisfactorily overcome, the next step towards the production of a negative is the correct exposure of the sensitive plate. And here at the very start is what is probably the most difficult part of the whole photographic procedure for the tyro to understand and regulate, for in the proper regulation of the exposure lies the crucial matter respecting all subsequent proceedings for the creation of a photograph. Of course, there exists a certain latitude, for very slight errors made in gauging the time can, to some extent, be remedied during the development; or, perhaps, it would be more consistent with facts to say that in the case of slight over-exposure this is so; but in the event of the plate being under-exposed, a good negative can never result therefrom. It may, however, be enunciated as a photographic axiom that an absolutely correctly timed exposure is necessary to produce a perfect negative, hence the great necessity for a photographer to be able to insure accuracy in this part of his work. No rule can be given, for there are so many varying circumstances that must be taken into account. All that can be done to assist the beginner in mastering the question of exposure is to point out to him the conditions which are factors in the matter, and their relative importance, and then to leave the rest to his powers of applying the information in a practical manner, and, perhaps, to pointing out the fact that he must profit by the experience which is to be gained upon the subject by every negative he produces. The question may appear a little complicated at first, but experience will soon master the difficulty, and after a few errors have been made and one or two successes have been accomplished, the faculties will quickly grasp and almost instinctively solve the question which must arise whenever a sensitive plate is exposed to the light, namely, the duration of time to be accorded to the operation.

The subjects that have to be considered are the following: The light, and the alterations in its quality for photographic purposes which the season of the year and the time of day may effect. The next factor is the sensitiveness of the plate, where experience regarding the particular emulsion being used can alone be relied upon, coupled with that approximate guide to the solution of this important question which the sensitometer number as supplied by the makers may confer. The next feature to be considered when solving the problem is the nature of the lens and the aperture at which it is to be used. The peculiarities of the scene being photographed have also to be taken into account.

But before enlarging upon each of these points, and endeavouring to illustrate the nature of their influence upon the subject now under consideration, it may be as well to refer more particularly to the various methods by which the exposure of the plate can be made, for to some extent this detail has an important bearing upon the matter.

In order to keep light out of the camera, and enable the shutter of the dark-slide to be drawn after it has been placed in its position, namely, that previously occupied by the ground-glass screen, the lens must be covered. This covering is accomplished by a small leather cap which fits tightly on the hood, and is always sold with the lens, or else by having an exposure shutter fixed to it or the camera, and to which useful instrument reference has already been made under the head of "Accessory Appliances." A shutter is only absolutely necessary when quicker exposures are re-

quired than the hand can accomplish in completely removing from and readjusting the cap on the lens; but if the shutter has the requisite regulating mechanism, allowing it to be kept open at the will of the operator, then it is always advisable to use it when making an exposure, except in cases when an exceptionally prolonged one is indispensable. The use of the cap requires skilful hands. The uncapping and capping a lens appear to be such simple proceedings that the beginner is apt to forget that there are right and wrong methods of doing them. The cap must of necessity fit somewhat tightly on the lens hood in order that it should not fall off in an accidental manner after the plate has been placed ready for the exposure. In removing it, therefore, especially when an exposure of a very limited duration is all that is required, such as that known as "cap off and on," some dexterity is required to do it in such a gentle way that no movement or subsequent vibration is communicated to the lens or camera, otherwise a blurred negative may be the result. Again, the hand with the cap must be entirely removed from the field of view with the utmost rapidity, for during no appreciable part of the time that the lens is uncovered must any of the view be obstructed by the unskilful handling of the cap. By neglecting to appreciate this fact the plate can be fogged. When this method of exposure is adopted, the attention becomes fixed upon the operation, to see that no accidents of the nature referred to have marred the picture, and in the event of the subject being a portrait, or one having objects within its scope liable to movement, then no certainty exists that everything was quiet during the time the lens was uncovered, for the eyes were elsewhere engaged. When, however, a shutter is employed, and its control is regulated by the simple method of squeezing an india-rubber ball, then the eyes can be studying the subject being photographed, and if the senses fail to discern any movement, then some feeling of security regarding the character of the negative in this respect is gained.

With that class of exposure which has been absurdly called "instantaneous," the regulation of the time is not a very easy matter, for but little reliance can be placed on the even working or correct timing of the mechanism employed in the construction of the exposing shutters. As absolute guides to the duration of the exposure, they are, therefore, simply worthless, but this information is rarely required, as the various speeds at which they can be set supply an approximate guide, which is all that is necessary in practice, and, therefore, a few testing experiments with the shutter on moving objects will furnish all the information which the photographer requires. When a quick acting shutter has to be used because the nature of the subject to be photographed requires it, as in the case of moving objects, then it follows that the duration of the exposure being a fixture, all the other appliances have to be governed by this fact. The reverse proceedings have under these circumstances to be taken than prevail when a time exposure is possible. In the one case the regulation is accomplished by calculating the value of the light, stops, and sensitiveness of the plate; in the other the stop to be used and the sensitiveness of the plate must be made to accord with the requirements ordained by the light and the speed at which the shutter has to work.

It is a mistake for anyone anxious to acquire some photographic skill, to begin by making these excessively rapid exposures. There is very little useful information to be gained from them beyond the fact that with a fairly large stop on a very bright day, a plate can be used sensitive enough to take a picture of rapidly moving objects exposed for only a fractional part of a second by aid of a shutter. Once the curiosity upon this subject is gratified, no better

advice can be given than is contained in the remark that a considerable amount of practical experience and appreciation of the factors governing time exposures should be acquired before "instantaneous work" is resumed. By adopting this method of procedure, the young photographer gains that mastery over his tools which is essential for the creation of good work, and which cannot be acquired by constantly using only one system.

(To be continued.)

## Instantaneous Photography.

By W. JEROME HARRISON, F.G.S.

### CHAPTER XI.

THE SENSITIVE PLATE UPON WHICH THE IMAGE IS TO BE IMPRESSED BY LIGHT.

#### II.—THE SUBSTANCE SENSITIVE TO LIGHT.

*Silver Chloride not Sufficiently Sensitive to Light for "Instantaneous" Work.*—Fox-Talbot published his "Photogenic Process," based on this discovery, in the year 1839. He obtained pictures in the camera on paper so prepared, with an exposure of about one hour. Supposing it were possible to reduce this time to minutes, it is yet evident that in silver chloride we have a material which is not sufficiently sensitive to light to enable us to use it for securing pictures of objects in motion, which is the main purpose of instantaneous photography.

For *printing* processes, however—that is for obtaining positive copies on paper or glass of the negatives secured in the camera—silver chloride has proved of great value. All the ordinary "albumenised" and "mat-surface" sensitised paper, of which such enormous quantities are used every day, is prepared in accordance with the principles of Talbot's first discovery. Glass plates coated with the same substance are also much used for the production of lantern-slides and transparencies.

*Silver Iodide as affected by Light.*—Each molecule of the yellow compound called iodide of silver contains one atom of silver and one atom of iodine; we may therefore represent it by the letters AgI.

Attempts to use silver iodide for photographic purposes appear to have been first made by that "patient" photographer, Joseph Nicéphore Niepce, about 1825-30; but he obtained no success with it. In the hands of his partner, L. G. M. Daguerre, silver iodide proved, however, the foundation of the first commercially successful photographic process—the daguerreotype. Silver iodide was formed by exposing a plate of silver to the vapour of iodine; this plate was exposed in the camera for about twenty minutes, and was then *developed* by means of the vapour of mercury. Daguerre published this process in 1839.

Pure silver iodide is *unaffected* by light. But in the silver backing of the daguerreotype plate we have a *sensitiser* capable of attracting and combining with the iodine liberated by light from the silver iodide. Still, the *original* daguerreotype process was evidently useless for "instantaneous" work.

*Fox-Talbot adopts Silver Iodide, and bases his "Calotype" process on it.*—It was but natural that after the publication of Daguerre's work the English amateur Fox-Talbot should try to adapt to his own procedure, upon paper, the substance (silver iodide) with which the French artist had been so successful. This he succeeded in doing, and the "Calotype" or Talbotype process was patented in 1841. Silver iodide was formed upon paper, was exposed in the camera for about three minutes, and was then developed with a mixture of gallic acid and nitrate of silver.

Still an exposure lasting for "minutes"! Evidently the calotype process was not suited for "instantaneous" work. It was, however, largely practised by English amateurs for landscape work, from 1842 to 1856.

*Archer uses Silver Iodide in Collodion.*—Silver iodide was the sensitive substance used in Scott-Archer's collodion process, as published by him in 1851. With this wet collodion process, the average exposure was about ten seconds; and instantaneous pictures were *possible*, when all the circumstances were very favourable.

*The Substance Most Sensitive to Light—Silver Bromide.*—Although certain French orators, at the time of the publication of the daguerreotype process in 1839, made extravagant references to it, the fact is, that had it remained unimproved it would have been of little use. This was especially true with respect to portraiture, for the attempts made to secure portraits involved sitting with one's face floured in the sunshine for twenty minutes; and it is no wonder that "traces of peculiar agony" were all that could be subsequently recognised upon the developed plates!

The introduction of silver bromide as a photographic agent has been claimed for several workers; but we shall not go far wrong in assigning its introduction to John Goddard, a London science teacher, in 1840. The element called bromine is a dark-red liquid; and by exposing silver plates to the vapour of this liquid Goddard obtained a layer of silver bromide; also, by exposing the silver plates first over iodine and then over bromine, a mixture of silver bromide and silver iodide was obtained, which appears to have been preferred by the daguerreotypists to the silver bromide alone. Silver bromide itself is a yellowish-white solid, whose molecule contains one atom of silver and one atom of bromine; we may represent such a molecule by the formula AgBr.

*Silver Bromide takes the Lead in Photographic Processes.*—The virtues of silver bromide once made known, it was naturally tried in the various photographic processes which succeeded—and displaced—the daguerreotype; and in every case it was found to diminish the necessary length of exposure to light, thereby proving its superior sensitiveness.

But silver bromide scarcely got a fair chance until the introduction of "emulsion" work, in 1864, by Sayce and Bolton. Silver iodide makes a poor emulsion; it clots and sinks too quickly through "the liquid," while silver bromide remains suspended, and form a capital emulsion. For the same reason Dr. Maddox used silver bromide in compounding his gelatine emulsion in 1871; and all subsequent researches have proved that silver bromide is unequalled in the ease with which it is acted upon by light. By the aid of this substance embedded in gelatine, we can arrest the bullet in its flight, the meteor in its course, or the bird on the wing. No plate-maker of to-day but relies mainly, or rather exclusively, upon silver bromide for the rapidity of his plates.

*Varieties of Silver Bromide.*—In its chemical composition silver bromide is, of course, always the same. But *physically* it forms many varieties. These depend upon the manner in which the molecules are aggregated together to form particles. There is a certain degree of size of these particles which is most favourable to the sensitiveness of silver bromide to light; and this can only be obtained under special conditions and by special treatment.

In 1874 M. J. S. Stas was able to prepare six distinct varieties of silver bromide, and he then wrote, "The granular bromide (of silver) is the most sensitive substance to light with which I am acquainted."

Ten years later, the subject was studied specially from a photographic point of view, by another chemist, M. De Pittteurs. He drew up the following valuable table of

eight distinct varieties of silver bromide, which he was able to distinguish in various photographic processes.

DR. PITTEURS' TABLE OF THE EIGHT VARIETIES OF SILVER BROMIDE.

By Transmitted Light.	By Reflected Light.	Occurrence.
Semi-transparent	Orange {	Slate blue { In fresh collodion emulsion.
	Bluish-white {	Older bromide of silver in collodion wet-plates.
	Reddish-orange {	In very sensitive wet collodion plates.
	Yellowish-white {	In very old bromide of silver in collodion
Almost opaque	Violet-blue {	In very sensitive collodion emulsion.
	Greenish-yellow {	Bromide of silver in gelatine: sensitiveness medium.
	Green or violet-green {	Very sensitive gelatine emulsion.
	Blue {	Slightly sensitive silver bromide in collodion, yielding indistinct pictures. Affected by red end of spectrum.
	Indistinct	

The object of the maker of plates to be used in instantaneous photography is to secure the last variety but one (violet-blue by transmitted light, green by reflected light) of the eight forms of silver bromide enumerated in the above table. How this is accomplished we shall see a little further on.

(To be continued.)

## Exhibitions.

### MR. HAGUE'S PICTURES OF NORTH CAMBRIA.

THE sentimental poacher recently portrayed by "Q" would, we are sure, be pleased with many of the pictures by Mr. Anderson Hague, R.I., now exhibited by Messrs. Dowdeswell. There is a depth in his skies which adds not a little to the success of his landscapes. In "A Welsh Harvest" (6) he has exhibited artistic power which might well have been extended to the somewhat careless drawing of the girl in the foreground. That Mr. Hague can paint figures excellently, if he chooses, is evident from "The Return of Spring" (30), wherein two children are admirably drawn. Three floral pictures show Mr. Hague's careful botanical study, especially of chrysanthemums. The "Mill Stream" (7) exhibits a transparency in the water which is commendable. "Springtime of Life" requires a good light to show its excellencies, which are many.

### SKETCHES BY MR. CLAUDE HAYES, R.I.

IN this exhibition of sixty-six modest sketches, Mr. Hayes has wandered over Surrey hills, Sussex plains, Hampshire shores, and Dutch dales. His "View of Hindhead" (18) is not so successful as "Spring in Surrey" (26). The sky in "Mudford" (24) appears to us unnatural, but in "Sunset at Christchurch" (40) this portion of the sketch is more carefully executed. In his Dutch views, Mr. Hayes admirably depicts the primness of the houses and the level landscapes which are such a feature in Holland. But "In Holland" (56) is distinctly impressionistic, and, therefore, not so happy. "Frensham Pond" (57)—a favourite resort of artists—is admirably painted, as is also "Royal Common" (62).

## Round and about the Clubs.

### ENFIELD CAMERA CLUB.

THE first annual exhibition by the members of this Club, which was held in the Lecture Hall, Chase Side, Enfield, on Saturday, was a great success, and the members owe much to the hard work done by the Hon. Sec., Mr. J. Dudin, and the other members of the Committee. This is all the more so, because a considerable number of the members were somewhat behindhand in doing their share towards securing the success of the show. Wednesday was fixed as the last day for sending in exhibits, but on that evening those members who had sent in their frames found it necessary to send in more, so that the walls might be covered. On Thursday and Friday, however, other frames were sent in, but, of course, could not be used, the space being all occupied. This is not as it should be. With ample notice of the exhibition, surely it was the duty of every member to see that his frames were in by the day fixed, which would not only make the show more representative and more successful, but would save the Hanging Committee and the unfortunate Hon. Secretary much anxiety. We put this point before the members of other societies who are purposing to give an exhibition.

There was a very fair show of pictures, and, speaking generally, the work was good, especially when it is considered that most of the members of the Club are young workers in the art. Mr. H. T. Knight showed a couple of fine platinum prints, "Winter" and "Autumn;" an enlargement, "Chums," a boy nursing a kitten; he also exhibited several charming little marine studies, which were deserving of all praise; there were also on view his prints of negatives taken in the Lake District, which were shown at the Pall Mall Exhibition. Mr. Dudin showed a beautifully soft print in platinum of Temple Bar, and others of Shanklin Chine, Portsmouth Harbour, and Trent Park; there was also a view of a picturesque country road, entitled "When Autumn Leaves are Falling." Mr. Pinkney showed a fine moonlight effect which attracted considerable attention. Two professional members of the Club, Messrs. Fellows and Lodge, showed a considerable number of frames, containing some very good work; the latter showed some very nice prints by his wife, Mrs. Alice Lodge. Mr. H. V. Clements sent for exhibition a number of stereo prints which were taken in 1864 and 1872, and were in a splendid state of preservation, there being very little fading. Mr. A. J. Ransome's enlargement, "Winter," was a fine study, and Mr. W. Street's view of "The Glen, Chudleigh," and his snow scenes were charming. There was a fine enlargement by Dr. Cresswell, a view of "Digswell Mill Pond," which made a nice picture and was well treated; he also showed "A Study of Cattle," on Fry's new "Naturalistic" paper, the effect of which was very good. Mrs. Bowles sent a fine enlargement from a negative, of two swans, and very good view of the interior of the drawing-room at Okeover. Amongst other good views were a good interior by Mr. Dudin; "Stepping Stones," "Skiddaw from Derwentwater," and "A Breaking Wave," by Mr. H. T. Knight. Dr. Cresswell and Mr. Knight also showed some fine lantern slides.

The time of the exhibition was divided into two portions, from 3 to 6 p.m., and from 7.30 to 10, and a lantern slide exhibition was given on each occasion, and vocal and instrumental music performed at intervals. The exhibition was altogether a great success, large numbers of the general public paying it a visit during the course of the day.

## Reviews.

*Bibliotheca Polytechnica*: A Directory of Technical Literature; a Classified Catalogue of all Books, Annuals, and Journals published in England, America, France, and Germany. Edited by Fritz von Szezepanski. (Sampson Low, Marston, Searle, and Rivington, Fetter Lane, E.C. Price, 2s.)

We have here what should be one of the most valuable handbooks to any journalist, scientist, or general reader, viz., a catalogue of the works published during the year on every conceivable subject, in English, French, and German. Turning to "Photographie, Photographie, Photography," we find a complete list of serial publications and books published during the year,

which would be of great value if the correct subscription price were given, which is not always the case, as we find the AMATEUR PHOTOGRAPHER priced at 18s. The volume, only eighty pages, sent for review is that for the year 1889. A work of this character, to be of any value, should be published as soon as possible after the close of the year. The titles of subjects are given in the three languages mentioned above, but the sub-headings are in German only. Thus we turn to "Railways," and find "See Eisenbahnwesen, Chemins de Fer, Railways," but the sub-headings are "Befähigungsnachweis," "Eisenbahnrecht," "Statistik," "Strassenbahnen," "Tarifwesen." The French and English terms should obviously be also given. As we have already stated, the work if brought out to date with the corrections suggested, would prove of immense value.

*Fotografisk Tidskrifts Arsbok*, 1890. Edited by Albin Roosval.  
Published by R. Blaedel and Co., Stockholm.

This annual, embellished by three fine collotypes and several process blocks, comes to hand and contains some useful and instructive articles and tables, and a very good retrospect of the advances in science and apparatus made during the past year.

*Ausführliches Handbuch der Photographie*, by Dr. J. M. Eder.  
Published by Wilhelm Knapp, Halle-a-S., in fortnightly parts, at 1s. each.

We have received Parts I.—VIII. of this stupendous work, and congratulate both author and publisher on the completeness and style with which the work is to be published. Parts I.—III. contain the most complete history of photo-chemistry and photography yet compiled. The author traces the records of the action of light from Aristotle 4 B.C. to Daguerre in 1839. Parts IV. and VI. deal with the action of the solar spectrum and dyes on the silver salts, photography and meteorology, and celestial photography. Parts VII. and VIII. contain the photometry of the chemically active rays, etc., and photography by artificial light. It is a matter of great regret that no English translation of such an indispensable and authoritative work is being published, as the information is of the most complete and recent kind.

*Photographers' Diary and Desk-Book*. (Camera Office.)

We have before us the number for the current year, which is as full of useful information as ever. There are formulæ for all the various methods of printing and developing, and notes upon various new apparatus. There are three days on a page, and they are interleaved with blotting paper, and, generally speaking, the diary will prove a most useful addition to the photographer's desk.

## Apparatus.

### "PRESTO" HAND-CAMERA.

MR. A. FRANKS, of Manchester, Southport, and Hull, has sent us one of his "Presto" hand-cameras, which is a marvel of ingenuity. The camera, quarter-plate size, is well made of ebonised wood, and fitted with a periscope lens, which gives good definition and a perfect field; a shutter of most ingenious and simple construction, admitting of either time or instantaneous exposures, is fitted to the camera. A dark slide is sold with the camera, which is well made and light-tight. Each "Presto" is sent out with half a dozen extra rapid plates, developing and fixing solutions. The whole is packed in a neat case and sold complete for 10s. 6d. It is not a toy, but a thoroughly efficient apparatus, and will have an enormous sale, bringing photography practically within the reach of all. Extra dark-slides are supplied at 2s. each. The camera will be on view at our offices next Monday afternoon, and subscribers or others are at liberty to inspect it.

### CHEAP OPTICAL LANTERN.

MESSRS. PRICE, TALBOT, AND Co., of Ludgate Hill, have sent us one of their 40s. lanterns, which they are offering for a short time at the reduced price of 27s. The lantern body is strongly made and japanned, and the three-wick lamp is made of Russian iron. There are excellent 4 inch compound condensers, and the objective consists of a good quarter-plate French portrait combination, giving good definition on a 9 ft. disc. There is a rack and spindle adjustment to the lens. Optical lanterns can be got

at very low prices now a-days, but the one before us is certainly one of the best made and cheapest at the price that we have seen. It is also admirably adapted for enlarging purposes. Visitors may see it at our offices on Monday afternoon.

## Notes from the Edinburgh Centre.

(By our District Editor.)

MR. GAMBIER BOLTON, F.Z.S., London, the famous animal photographer, gave a lecture in Queen Street Hall, Edinburgh, on Wednesday night, under the auspices of the Edinburgh Photographic Society, whose first popular night it was this season. A large assemblage turned out to hear Mr. Bolton, whose subject was "Animals and Birds Photographed from Life and Described." Mr. Bolton showed, in illustration of his subject, over a hundred slides which, he said, had been exhibited before Her Majesty the Queen, the Royal Society of London, and other kindred societies. The photographing of animals he described as the most difficult branch of the art of photography, and very few people devoted themselves to that special study. He gave a number of instances of the difficulties which the bird or animal photographer had to encounter, and then referred to the many advantages which the scientist and the artist derived from such photographs. The lecture was a treat.

The third annual meeting of the Leith Amateur Photographic Association was held in the Hall of the Association in Duke Street, on the evening of Tuesday, January 27th. There was a large attendance, over which Mr. W. Dougall presided. Mr. A. D. Guthrie, the Secretary, read the annual report. It stated that the Council had the feeling that the Association had maintained its position during the past season, as being of interest as well as instructive to its members, and had therefore continued to justify its existence. Since the last report was submitted, the aim of the Council had been, as far as possible, to keep the members of the Association fully informed of any new departure in any of the branches of the photographic art, by means of papers and illustrations. During the year just ended six new members had joined the Association, and four members had tendered their resignations, so that the membership at present stood at forty ordinary members and one honorary. After detailing the papers and communications brought before the members, the report stated—the Association had given two popular evenings during the session, the first being the usual exhibition of lantern slides, the work of members, held in Junction Street Hall, in February, at which 182 slides were shown, and the second held in Kinnaird's Hall, in October, when the "White Mountains of New Hampshire" set of slides, the work of the members of the Boston (U.S.A.) Camera Club, were shown, both meetings being highly successful. The Association had held no outdoor meeting during the session; the attendance at these meetings latterly being so small it was decided that for the time being they should be discontinued. A dark-room lamp and the necessary measures and trays, for the successful carrying on of demonstrations, had been purchased during the year by the Association. The Council, in carrying out their efforts for the prosperity of the Association, hoped to have the continued sympathy and assistance of all the members, and so make the season upon which the Association was now entering as successful as previous ones. The Treasurer intimated a cash balance of £5 16s. standing to the credit of the Association. The following office-bearers were elected for the ensuing year:—President, Mr. W. Dougall; Vice-President, T. W. Dewar; Treasurer, John Pourie; Secretary, Alexander Pitkethly; Committee, William Smith, F. G. L. Lorimer, R. C. Ewart, R. Hunter, Dr. M'Creadie, James Chapman, William Swanston, M. Campbell, and T. Wilson. On the motion of the President, a very hearty vote of thanks was passed to Mr. Guthrie for his invaluable services to the Association as Honorary Secretary from its commencement. At the close of the business, Mr. Smith exhibited on the screen a number of views, the property of Mr. C. Reid, Wishaw. Mr. Reid has been a particularly keen student of animal life, and among his eighty-four slides which passed through the lantern were some exceptionally fine pictures. At the close, the meeting, on the motion of the President, awarded Mr. Smith a vote of thanks for obtaining and exhibiting such a very interesting series of views. It was arranged to hold a popular meeting in Junction Street Hall on the 24th of February. During the

past session two of the members have obtained prizes for their work, viz., Mr. A. Pitkethly, who gained a Silver Medal and a guinea for a series of six views of the Forth Bridge in an AMATEUR PHOTOGRAPHER competition; and Mr. A. D. Guthrie, who received the third prize of £15 in the "Travelling Studentship Competition," for six landscapes with figures, also in connection with the AMATEUR PHOTOGRAPHER, the first prize of £30 in which went to New York, and the second of £20 to Vienna. Mr. Guthrie has also just received the fourth prize in a lantern-slide competition for a series of six instantaneous views.

## Notes from the Liverpool Centre.

(By our District Editor.)

PROGRESS with our exhibition matters proceeds apace, and in more than encouraging fashion. Altogether the show is likely to prove a very extensive and very model one. Many people have been under the impression that the very stringent conditions imposed on workers in all but four classes, "that the exhibitor should be the author of the entire production," would prevent a large number of gentlemen coming forward and competing. This pessimistic view has been completely falsified. At the time of writing, the entries for the exhibition considerably exceed those of the 1888 show, and the list of really good men is also larger. As I have mentioned before, the Continental men and other workers farther afield, have responded most heartily. The lantern demonstrations will be a pronounced feature, the list of demonstrators including the more noted experts in this special line. Among the names I find those of Messrs. Paul Lange, who will open the series with his "Iceland," giving the lecture for the first time publicly; William Tomkinson, "Normandy;" Gambier Bolton, "Animals;" A. R. Dresser, "Celebrated Snap-Shots;" Charles W. Hastings, "AMATEUR PHOTOGRAPHER 1890 Prize Slides" and "Recent Photography;" and J. W. Wade, L. Howie, S. G. Harrison-Dearle, J. P. Gibson, George E. Thompson, Walter D. Welford, W. Brookes, E. M. Tunstall, etc., etc., will contribute.

At the monthly meeting of the Liverpool Society, held last Thursday, 29th ult., there was a crowded attendance. Seven new members were added, bringing the strength of the Society up to 283. A pleasant time was passed with Mr. F. Anyon's exhibit and lantern entertainment, the "business" portion of the evening being largely devoted to an important expression of opinion concerning "Amateur" work. Rule 2, as amended, will read:—

### DEFINITION OF "AMATEUR."

"This Association shall consist exclusively of amateur photographers, and the term 'Amateur' as here used shall be understood to apply to any person who, while pursuing the subject of photography as a recreation, or in the interests of science, does not make the practice of the art a means of livelihood, or a necessary part or definite source of income."

It is felt up here that this definition should be an accepted and final settlement of the somewhat knotty and difficult amateur question. Certainly, the amended rule is the outcome of long and careful thought on the part of Mr. P. H. Phillips, a former President, and one of the oldest and best respected members of the Liverpool Amateur Photographic Association. This said, it is needless to go further into the amended rule, being the candid expression of a gentleman fortified by long experience and "backed" by an enviable reputation. The Liverpool Society can claim also that they have been pioneers in clearing away much that has circumscribed the sometimes much abused and totally misunderstood and misconstrued "amateur photographer."

Following Mr. Crowe's practical demonstration on "Spotting of Prints and Blocking-out of Skies in Negatives, Silver and Platinotype, etc.," next Wednesday Mr. E. M. Tunstall has arranged for Dr. Jumeaux, of the Manchester Amateur Photographic Society, to come to the Liverpool rooms at the February ordinary meeting on the 26th, to give a paper and demonstration on "Eikonogen v. Pyro as a Developer."

Great satisfaction is expressed with the capital reproduction of one of Mr. Paul Lange's hoar-frost scenes, which appears in the current issue of *The Art Journal* as one of the illustrations to an article on "Recent Photography" from the pen of Mr. Charles W. Hastings, who is so well known as the Editor of the AMATEUR PHOTOGRAPHER and other photographic publications.

## Societies' Meetings.

**Bat's.**—A meeting was held on the 28th ult., Mr. W. Pumphrey (the President) in the chair. Miss Melita Bird and Mr. Cecil Bradshaw, Mr. Ernest Lambert, Mr. Graystone Bird, and Mr. C. W. Dykes were elected members of the society. The Chairman drew attention to the pamphlet sent them by Dr. Emerson, which appeared to be a recantation of the views expressed in his work, "East Anglian Life." Portions of the pamphlet were read, and the Chairman said the recantation added tenfold value to the book itself. Mr. J. Dugdale then showed the improved form of lantern scope he has recently devised for the purpose of viewing lantern-slides. The Secretary showed a telescopic sliding metal tripod, sent by Mr. Pumphrey, of Birmingham. The Chairman then followed up his demonstration of enlarging processes. In this instance a very simple apparatus was used—a dark chamber, in an aperture of which the negative to be enlarged was placed—in front of that an expanding camera minus the focussing and dark-slide, and in front and movable in three directions an easel to carry the sensitive paper. A paraffin lamp, placed within the chamber, was used for focussing the enlarged image on the easel, after which it was removed to a tin lantern with a red glass front. A piece of oiled ground-glass was next placed before the negative to act as a diffuser, the sensitive paper adjusted on the easel and the exposure made. This was done by means of magnesium ribbon; a string of ribbon six inches long and held by pliers was ignited at a spirit flame inside the chamber, and passed during combustion from side to side and up and down in front of the ground glass screen, this process being repeated as often as required. To produce a fully impressed enlarged positive on bromide paper, say from a dense half-plate negative, the enlargement being about three times lens, working at  $f/12$ , three such pieces of ribbon would be required. If a negative possesses great density in parts the plan of illuminating offers distinct facilities for adapting the light to suit it. Mr. Pumphrey stated that this method was introduced by Mr. Monkhouse, York, and that it was by his special permission he brought it before the society. The exposed paper was developed, and the result handed round. An exhibition of lantern transparencies then took place. First there was a competition for the best set of slides, the work of the competing members, and also of the best individual slide. Mr. H. G. P. Wells secured the highest number of votes for his series. For the best individual slide the award was given to Mr. Ernest Peacock, for a view at Uplyme. The remainder of the evening was devoted to an exhibition of non-competing slides, contributed by the Chairman, Messrs. Grisow, Wells, Powell, Dugdale, Shackell, and others.

**Birmingham.**—The ordinary meeting of the above society was held on the 29th ult., Mr. W. J. Harrison, F.G.S., in the chair. Eight new members were elected. The evening was devoted to a developing competition and demonstration. Plates were exposed in the room behind negatives, and then developed with the developer and by the member whose name follows it:—Pyro and ammonia, by Mr. J. T. Mousley; pyro and potash, by Mr. J. Simkin; hydroquinone, by Mr. G. A. Thomson; eikonogen, by Mr. A. J. Leeson; "demon," by Mr. J. H. Pickard; ferrous oxalate, by Mr. W. J. Harrison. The question-box contained the following: "How are photo-etchings produced?" Mr. Jeome Harrison said that he was not aware of the details of this "photo-etching" process, but that in principle he believed it to consist in imposing a carbon print upon a grained metal plate. A solution of perchloride of iron was then poured over the carbon picture, and this solution acted through the carbon image, biting or etching the metal beneath it. The metal plate could then be used to print from.

**Brighton.**—Lantern evening, January 27th. The slides sent in to the AMATEUR PHOTOGRAPHER Competition were shown to a large audience.

**Bolton.**—The fortnightly meeting was held on the 28th ult. The President, Mr. J. Johnston, M.D., gave a very interesting and graphic description of his recent voyage and visit to America, illustrating the same by some splendid slides and prints which he had taken. At a previous meeting Dr. Mackenzie, the Vice-President, gave a lantern illustration of his recent "Three Weeks' Tour with the Camera in Scotland." Both meetings were well attended.

**Cardiff.**—Through the courtesy of the Boston Camera Club, the executive of the above Society were enabled on the 30th ult. to place before a Cardiff audience the second series of American slides. An imaginary trip was taken through that section of Northern New Hampshire which is called the "Crown of New England."

**Croydon.**—The first annual meeting was held on the 2nd inst., the President, Mr. H. Maclean, F.G.S., occupying the chair. The report, which was of an unusually gratifying character, stated that no less than seventy gentlemen had been elected since the Society was founded on February 25th, 1890. The accounts showed a balance in favour of the Society of £16 15s. 4d. During the year twenty evening meetings had been held for the consideration of special subjects; weekly conversational meetings had been arranged for since July last.

A number of successful photographic rambles were held in the summer. The club rooms are central, and are fitted with most things necessary for ordinary photographic operations, more especially for dark-room work. The rooms are open every week-day to members from 10 a.m. to 10.45 p.m. The following officers were chosen to serve for the ensuing year:—President, H. Maclean, F.G.S.; Vice-President, Dr. Strong, J.P.; Treasurer, A. E. Sargeant; Hon. Sec., G. R. White; Hon. Assist. Sec., E. F. Blow.

**Dukinfield.**—The monthly meeting of members was held on the 26th ult., when the night was devoted to general conversation and the best means of promoting the exhibition to be held on the 13th and 14th of February next. A special meeting was held on the 30th ult. in the Board room of the Co-operative Hall, when the AMATEUR PHOTOGRAPHER 1890 Prize Lantern Slides were exhibited. The slides were each received with well merited applause. The annual exhibition of prints, slides, etc., will be held on Friday and Saturday, the 13th and 14th inst.

**East Southsea.**—The first annual smoking concert in connection with this Society was held on the 26th ult. An excellent display was made at one end of the room, where a large number of photographs, lantern slides, etc., all the work of members, were artistically arranged. A capital programme was gone through.

**Harlesden and Willesden.**—A meeting of this Society was held on the 27th ult., Mr. J. Naylor (the President) in the chair. After the transaction of the preliminary business Mr. Seed was called upon for the second part of his paper on "Elementary Rules of Art Applied to Photography." Mr. Seed illustrated his lecture by numerous photographs, etchings, and cuttings from art journals, besides many diagrams of his own work; and his explanations of etchings by Landseer and other artists, especially some descriptive of Burns' "Cotter's Saturday Night," were masterly and exhaustive, and showed his wonderful grasp of the subject. The Hon. Secretary (Mr. Cohen, 26, Wendover Road, Harlesden), requests us to state he would like to know of any intending members, so that the Society may arrange its syllabus for the coming season. The subscription is only nominal. On Tuesday, February 10th, Mr. Clapton will read a paper on "Lenses."

**Holborn.**—Friday, the 30th ult., was lantern night. Slides by Messrs. Chang, Golding, and Miller, including views of Henley Regatta, Ascot Races, Orpington May Day Festival, Oxford and Cambridge Boat Race, Ilfracombe, Ramsgate, Margate, etc., were shown to an appreciative audience of members and friends.

**Lewes.**—A highly interesting exhibition of photographs, photographic apparatus, transparencies, lantern slides, &c., was arranged by the Lewes Photographic Society and held at the St. Anne's Concert Hall on the 28th ult. In addition to the exhibition of work, which was nearly all by members of the society, there were two lantern entertainments, at which some vocal and instrumental music was also rendered. Unfortunately, the weather was very unpropitious, and the attendance was not so large as had been anticipated. The Mayor, who was accompanied by the Mayoress, opened the exhibition. The lantern entertainments were much appreciated, and when a slide of exceptional merit was shown a hearty round of applause was given. The principal feature of this part of the entertainment was the exhibition of the prize slides lent by the Editor of the AMATEUR PHOTOGRAPHER, which were greatly admired. If the palm is to be given to any particular class, it should undoubtedly be awarded to the architectural subjects, which were exceptionally fine. Some of the most striking subjects thrown on the screen were Caen Cathedral; South Door, Lincoln Cathedral; West Front, Rouen Cathedral; South Porch, The Choir, and other parts of Gloucester Cathedral; South Transept, Lincoln Cathedral; South Front, Lady Chapel, and Choir, York Minster; East Front, Entrance Hall, Veranda and Library at Eaton Hall; The Choir, Manchester Cathedral; Haddon Hall; Steps, Mont St. Michael; Kilkenny Castle; Yachting in Morecambe Bay; and A Stormy Sunset. During the evening a series of instrumental pieces and songs were given.

**Leith.**—The annual general meeting of this association was held on January 27th, Mr. William Dougall, President, in the chair. The Secretary's report showed the association to be in a satisfactory condition, the membership standing at 40, and notwithstanding the fact that two popular meetings had been given during the year, and various apparatus purchased for demonstration purposes, they had a balance of £5 16s. on hand. During the evening a series of 84 transparencies of "Animal Studies" from negatives by Mr. Charles Reid, Wishaw, were passed through the lantern.

**Luton.**—A most enjoyable evening was spent on the 2nd inst., when the prints contributed to the No 16 AMATEUR PHOTOGRAPHER Monthly Competition were examined and discussed. The Photographic Institute proposals were brought forward for discussion, but owing to the limited time, no decision was arrived at. Six new members were elected.

**Liverpool.**—The first ordinary meeting of the twenty-eighth session was held on the 29th ult. The President (Mr. Paul Lange) occupied the chair. The following were elected members of the Associa-

tion, viz.:—Norman Crook, A. C. Batty, Theodore Hubback, Miss Adams, F. W. Walker, E. C. Sole, and F. H. Elsy. A vote of thanks was accorded to the retiring officers of the Association, and the President then distributed to the successful competitors the medals awarded in the prize competition of last November. The meeting then resolved into a special meeting to consider certain alterations in the rules of the Association, at the close of which Mr. F. Anyon gave an exhibition of a new lantern, with which he showed a series of very fine slides, some of them of exceptionally high merit.

**North Middlesex.**—The last meeting was held on the 26th ult., Mr. W. T. Goodhew in the chair. Mr. G. R. Martin opened a discussion upon "Halation and Light Fog." He said halation was a spreading of the high lights into the adjacent shadows, and were assumed to proceed from reflections from the back of the plate. Another cause might be reflection from the crystals of haloid salts in the film. This would be small in quantity, and entirely on the surface of the film, and could be removed by gently rubbing with soft rag saturated with methylated spirit. A cause of fog was light reflected from the edges of badly finished lenses. A cause of halation, not usually considered, was to be found in the motes of dust in interiors, which would cause brilliant light to be dispersed, and form fog upon the plate. He then proceeded to give some instruction as to prevention and cure, which were listened to with much attention. An animated discussion followed, in which many members took part.

**Putney.**—At the meeting held on the 31st ult., the Rev. L. Macdonia in the chair, Mr. Howse, of the Britannia Works Company, gave a demonstration on the new Ilford special lantern plate. He exposed three plates, two to ordinary gaslight giving 15 to 25 secs. exposure, and one to the light of a wax vesta. Upon development it was impossible to distinguish one from another. The Secretary announced that he had received six dozen lantern plates and developers from Messrs. Edwards and Co., The Grove, Hackney.

**Sunderland.**—The monthly meeting of this society held on the 28th ult. was largely attended. The chief feature was a paper on "Lantern Slide Making," which was read by Mr. Edgar G. Lee, of Newcastle. After a most interesting explanation of his manner of working, Mr. Lee gave a demonstration of his method of developing, using hydroquinone. Upwards of 100 very fine slides by Mr. Lee and other exhibitors of renown were shown on the screen by the limelight lantern.

**Tunbridge Wells.**—There was a public exhibition of lantern slides on the 27th ult., shown by Mr. Cornell in the Sussex Assembly Rooms. The series of views was entitled "The Stately Homes of England," and included Windsor Castle, from the Thames and east front, with views of the corridor and green drawing-room in the interior; Hampton Court Palace, Lambeth Palace, Cobham Hall, Eastgate House, Rochester; Hurstmonceux Castle, Arundel Castle, Hatfield House, Charlecote House, Warwick Castle, from the bridge and courtyard, with an interior view of the famous cedar drawing-room; Guy's Cliff, Stoneleigh Abbey, Newstead Abbey, with views of the mediæval dining hall and the drawing-room, and also of Lord Byron's bedroom, which is kept as nearly as possible in the same state as in the days of the ownership of the poet; Welbeck Abbey, the Duke of Portland's seat, of which views of the Gothic hall, chapel, and great riding school were shown; Clumber House, Thoresby House, Chatsworth, the Duke of Devonshire's seat, shown from the bridge and garden, a peep at its priceless art treasures being also obtained by some fine views of the sculpture gallery; Hardwick Hall, with its magnificent entrance hall and picture gallery, and Queen Mary's bedroom, still preserved as the beautiful but unfortunate Queen of Scots occupied it; Haddon Hall, with its old banquet hall and ball room; Leahurst, Fountains Hall, Hawarden Castle, Eaton Hall, Alnwick Castle, Bamborough Castle, and Naworth Castle. Other views of the Medway, etc., were also shown, and there was a musical and dramatic entertainment.

**Tooting.**—The ordinary meeting was held on the 27th ult., the President in the chair. The evening was devoted to lantern-slide making by Mr. J. F. Child. The next ordinary meeting will be held on the 24th February, when Mr. Berger will demonstrate pyro development.

**Yorkshire College.**—A lantern exhibition, under the auspices of this Society, was held on the 29th ult., in the Chemical Lecture Theatre at the College. Dr. Jacob presided. A large number of slides prepared by Dr. Jacob, Miss Ethel Ramsden, and Mr. C. H. Bothamley were shown. Amongst these, the most interesting were several of Norwegian scenery, taken by Dr. Jacob; and a series of views in the Valley of the Wye, for which Mr. Bothamley was responsible. For the most part the photographs were of a high order of excellence. The exhibition altogether was a success, and the only cause for regret was that more members of the Society did not show samples of their work. Dr. Jacob explained at the outset that this was due to several unavoidable circumstances.

**Woolwich.**—On the 29th ult., Mr. Burnham, B.Sc., resumed his lecture on "Photographic Chemistry." The next meeting will be on the 12th inst.

## To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance, the number and full title of the query referred to.

## QUERIES.

4478. **Photographs of Different Styles of Window-Dressing.**—Are they to be obtained anywhere?—**J. H. MITCHELL.**
4479. **Watch Cameras.**—Can anyone inform me from experience whether Lancaster's Watch cameras are reliable instruments or not?—**SCRIPTOR.**
4480. **Eastman's Transparent Films.**—Will some one kindly tell me how to develop five or six exposures of the above film at a time, in one dish?—**DRAF AND DUMB.**
4481. **Carbutt's Plates.**—Will someone kindly give me the best formula for developing Carbutt's American plates with pyrogallol?—**DRAF AND DUMB.**
4482. **Copying Drawings.**—I should be obliged for directions in the following case:—The drawing is a pencil one, rather faint. What plate should I use, what stop, what exposure? My camera is half-plate. I have both slow and rapid lens; which is best? I presume hydroquinone would be best developer. I always use Ilford ordinary, as a rule.—**T. A. M.**
4483. **Rough Paper.**—I want a very rough surface printing paper, bromide, or plain salted for large work. Is such a paper made commercially?—**LIZZIE.**
4484. **Celluloid Films.**—Can any reader tell me of a really reliable make, rapidity not so much an object as a perfect film? Shall require a large quantity for a tour, and do not wish to be disappointed on my return.—**LIZZIE.**
4485. **Fixing and Toning Bath.**—Will the following fixing and toning bath keep indefinitely:—  
Tungstate soda ... 60 gr.  
Sulphocyanide ammonium ... 100 "  
Hypo sulphite soda, in 6 oz. water ... 980 "  
When dissolved, add 6 gr. chloride gold.—**INITIUM.**
4486. **Instantaneous Photographs.**—Can instantaneous photographs be got by a single lens?—**INITIUM.**
4487. **Sodium Hyposulphite.**—What weight of sodium hyposulphite will 1 oz. of cold water dissolve?—**INITIUM.**
4488. **Films.**—Will someone kindly advise me as to the best and simplest film to use in a roller-slide, and where obtainable, also if made in spools to suit ordinary roller-slides? The film would be required for detective work.—**A. E. S.**
4489. **Fixed Focus Lens.**—Will any brother amateur tell me where to buy a good fixed focus lens for quarter hand-camera?—**T. A. T.**
4490. **Reversal.**—In taking a gentleman and lady side by side, the order was reversed (from left to right) in the print. How can I avoid it in the future?—**E. T. E.**
4491. **Celerotype Prints, Loss of Tone in.**—I obtained a beautiful warm tone on some Celerotype prints with the borax bath, which disappeared immediately in hypo, and never returned; also the prints curled up in hypo, which I have never had occur before. Will someone kindly tell me how I may avoid the above?—**E. T. E.**
4492. **Snap-Shot.**—Will somebody please tell me if I can take a snap-shot with a hand-camera, at a moving object, from a carriage which is in motion?—**H. I. C.**
4493. **Platinotype.**—Can any body tell me why my platinotype prints are not sharp, although silver

prints taken from the same negatives are sharp and clear?—**H. I. C.**

4494. **Shutter.**—I am in want of a good, cheap, and efficient instantaneous (not time and instantaneous) shutter. Can any brother amateur recommend me a good one? Must have pneumatic release, so as not to touch the shutter. Can a Dewey's shutter, the Gem, be well recommended for instantaneous work? Is it strong, well-made, and effective? With thanks in anticipation.—**NIEPCE.**

4495. **Hand-Camera.**—Can any reader of the **AMATEUR PHOTOGRAPHER** tell me if it would be possible to convert Lancaster's Mervilleux into a hand-camera by making a box to take it, using a half-plate Lancaster's instantaneous lens and shutter, on a quarter-plate camera? If not, any description of how to make a cheap but good light-tight, serviceable hand-camera will oblige. Please do not refer me to any books or papers.—**NIEPCE.**

4496. **South Africa.**—I am going to South Africa at the end of March, and intend taking my cameras with me. Would any reader inform me what sort of developer would suit, also plates, paper, lens, etc.? Could they also inform me whether there is any accommodation on board (Donal'd Currie's line) for photographers?—**NEMO.**

4497. **Machine for Enlarging Drawings.**—A few years ago an apparatus was devised for enlarging drawings, etc., from a facsimile on a rubber or elastic surface, which material was capable of expanding or contracting uniformly in every direction. Will some reader give name and particulars of the apparatus, and say if it is used in England?—**ISTRIEL.**

## QUERIES UNANSWERED.

Jan. 16th.—Nos. 4447, 4449, 4453, 4455, 4456, 4457, 4459.  
Jan. 23rd.—No. 4463.  
Jan. 30th.—No. 4471.

## ANSWERS.

4444. **Enlargement Retouching.**—Chinese white and Indian ink will be found very suitable. The Indian ink may be made to match the tone of the print with a little lake.—**THE SMITH.**
4445. **Enlarged Negatives.**—Ordinary plates will do, but I can speak confidently of Thomas's transparency plates. They are cheaper than the majority of good plates, and are very easy to work. The exposure can only be arrived at by experiment.—**THE SMITH.**
4451. **To Mount Eastman Transparent Film for Enlargements.**—Place the negative film between two pieces of thin glass, free from flaws, and bind with lantern strips.—**THE SMITH.**
4460. **Speed of Shutter.**—Let  $a$  = length of aperture in the slide,  $b$  = diameter of shutter aperture, and  $c$  = vertical distance between  $a$  and  $b$  when shutter is set. Then  $\{(\sqrt{a^2 + b^2 + c^2}) - (\sqrt{c^2})\} \cdot 072$  = exposure in seconds. Thus, let  $a = 1\frac{1}{2}$  in.,  $b = 1$  in., and the distance between  $a$  and  $b$  in.  
Then  $\{(\sqrt{1\frac{1}{2}^2 + 1^2 + 5^2}) - (\sqrt{5^2})\} \cdot 072$   
=  $(1.73 - .7) \cdot 072$   
=  $(1.03 + .072) = .072$  sec., or about  $\frac{1}{10}$  sec.—**THE SMITH.**
4465. **Camera Bellows.**—See "Journal Almanac," 1891, page 522.—**THE SMITH.**
4467. **Toning Bromide Paper.**—The Fry Manufacturing Co. are sending out instructions for toning their paper. I have lately been trying their method, and have produced some nice results. Should advise "Neil Read" to send for particulars, or call and see their specimens.—**PADDY.**
4467. **Toning Bromide Paper.**—Bromide papers can be toned. Slightly over-expose the prints, and, after developing, tone in a bath composed as follows:—  
No. 1.  
Water ... 18 oz.  
Acetate of soda ... 4 drm.  
Chloride of gold ...  $\frac{1}{2}$  gr.  
No. 2.  
Water ... 18 oz.  
Ammonium sulphocyanide ... 2½ drm.  
Chloride of gold ...  $\frac{1}{2}$  gr.  
For use, mix 10 parts No. 1 with 3 parts of No. 2. After toning, wash the prints very thoroughly.—**HAMISH.**
4468. **Enlarging by Artificial Light.**—I am afraid an ordinary lamp is not sufficiently powerful to enable you to enlarge successfully. In the "Dictionary of Photography" a Belge lamp is recommended, one of 42-candle power, with an opal globe to diffuse the light.—**HAMISH.**
4469. **Hand-Camera for a Lady.**—I can highly recommend the Luzo camera, made by Robinson, 172, Regent Street. It is small and light, and cost me, including a black leather case, and ready charged with 100 films, £4 14s. 6d.—**H. I. C.**
4469. **Hand-Camera for a Lady.**—A "Lady Amateur" should buy either one of Fallowfield's Facile's or the Eastman Co.'s Kodak hand-cameras. They are both first-class cameras, and I think a "Lady Amateur" is wise in giving the price she mentions, viz., £5, instead of going in for a cheaper article.

She will find that she will be able to take pretty successful pictures with a camera at this price, whereas, with a cheaper one, she will very often take very indifferent ones, and this only leads to discouragement.—**HAMISH.**

4470. **Bromide Prints.**—You do not say when the bubbles appeared. Was it in developing or fixing? Unless your negative was fairly dense, 15 seconds would be far too much exposure. If you care to send me the prints I shall be pleased to report upon them. **PADDY** (address with Editor).

4472. **Paget Prize Plates.**—As far as I am aware, the manufacturers do not give a hydroquinone developer for their plates, but no doubt you will find the one given by the Britannia Works Co. for their plates suitable for the Paget plates. It is worth your while, at least, to try it.—**HAMISH.**

4473. **Aristotype.**—It is always advisable, when mixing up any formula, to do so in the order given. The colour of the toning and fixing bath, after it is mixed, is brown. After toning each batch of prints the solution should be filtered, and gold added from time to time. Silver-paper scraps from ordinary paper will do. I think you would get almost as good results by using one of the ordinary toning baths for silver paper; at least, I have found it so with Celerotype paper, which I have been using lately.—**HAMISH.**

4474. **Spotting.**—Before burnishing; colours, Indian ink and light red, or rose madder. Mix up with little gum water to imitate tone of print. To make the colour take on albumenised surface, wet with tip of tongue. Great care is needed.—**DERWEN DHU.**

4475. **Mounting Aristotype Paper.**—  
Pure India rubber ... 40 gr.  
Benzole ... 4 oz.  
Dissolve. Apply this solution to edges of prints only with camel's-hair brush, and transfer them carefully to mounts. Care must be taken when mounting to place print in its right position at once, as it cannot well be moved when once in contact with mount.—**DERWEN DHU.**

4475. **Mounting Aristotype Paper.**—I believe the best mount obtainable in the market is the Celerotype mount, sold in 6d. and 1s. bottles. You can coat the backing paper right over the face, not the edges only, and place on print while it is on the glass. When the print is dry, you can then mount it in the usual way.—**HAMISH.**

4476. **Making a Camera.**—If "H. L. N." will send me his address through you, I will send him measurements, and small drawing on how to make a camera.—**J. ROBERTSHAW.**

4477. **Views on the Rhine.**—"Kendal" may be able to get these from D. R. Duncan, 186, Fleet Street, or Spooner and Co., 379, Strand.—**HAMISH.**

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S POST if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—**ED: AM: PHOT.**

**NOTE.**—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.

**ARMY SERGEANT.**—"Photography for all" (Harrison), "Modern Dry Plate Photography" (Burton), both useful books. If you can afford it go in for a half-plate kit with an R.R. lens.

**E. G. LEE.**—Many thanks for particulars; sorry we did not receive a few days earlier in order to have included them in our notes on the competition in the *Reporter*.

**A. L. SPILLER.**—MS. received; may use it later on. **ETHELRED DILLON.**—Letter to hand. We sent off the entry form, but will add particulars to your picture.

**F. W. LEVETT.**—Another time, perhaps, you will be able to arrange matters.

**PATRICK M. MACHAON.**—Thank you for correcting us. The matter is, as you say, interesting as regards the copyright question only.

**A. E. VENK.**—We want to send you letter. Kindly let us have your present address.

**HYDROGEN.**—Incomplete combustion.

**G. MCINTOSH.**—Give us a call any Monday afternoon, or could see you by appointment on a Thursday. Cannot decipher address, so could not write to you.

**TE WIRIRIMU.**—There is no work in English, French, or German on the subject you name. We shall be pleased, however, to give you some hints if you can call any Monday afternoon between 2 and 5 p.m. Photography should be of great assistance to you in that special study, but it would entail a great deal of personal work of a rather laborious and "zeitsubend" character. If you cannot call we will write you.

**E. W. MALE.**—Mat silver prints give very fine artistic results prepared as you state. We should advise you to obtain No. 1 of the "AMATEUR PHOTO-

GRAPHER Library," (price 1s., from our publishers) where preparation of the paper is fully treated of.

CANADA.—You had an excess of acid, consequently on the application of heat this was dissipated. The addition of carbonate of soda precipitated carbonate of silver, which was again converted into nitrate on the addition of acid with the formation of nitrate of soda; addition of ammonia precipitated oxide of silver  $\text{Ag}_2\text{O}$ , which is not explosive, and also nitrate of ammonia; the addition of nitric acid redissolved the oxide. You must be careful when adding ammonia to nitrate of silver solutions, as had you added it in excess so as to form a clear solution, you might have obtained some fulminating silver which would have frightful results. The crystals you have got are probably a mixture of nitrate of silver and nitrate of ammonia, the mother liquor containing nitrate of soda and some silver. Your best plan will be to reduce to metal and redissolve. The best plan to dissolve silver for photographic purposes is to take one-third of the weight of silver in strong nitric acid, dilute with one-third water, heat and let it dissolve as much as possible, then pour off the solution and repeat the operation till all the silver is dissolved; take one-fifth of the resulting solution, add carbonate of soda till the whole of the silver is precipitated, collect and wash the precipitate, then add the carbonate of silver gradually to the acid solution of nitrate of silver, till there is a slight cloudiness from undissolved carbonate. If the bath is required for sensitising paper it is now in fit condition, or may be evaporated till the strength is right, thus 1 gr. of pure silver will make 1.574 gr. of solid nitrate or 15.74 gr. of 10 per cent. solution. The amount of acid required to dissolve the silver varies according to sp. gr.: Nitric acid of sp. gr. 1.3 will dissolve about its own weight of silver, acid of 1.2 specific gravity will dissolve two-thirds of its weight.

E. L. DELARUE.—A film holder would certainly have been recommended only that you merely wanted a report on the instrument and lens, or rather on the cause of the fog. The development of films is precisely the same as plates now that celluloid is used as support.

A. F. W. F.—Place a micrometer or object of known size on the stage, receive the image on a sheet of ground-glass slipped on to the end of the tube in place of eye piece, focus the image sharply; then measure the distance between the image and object, and measure the size of image. Divide the size of image by the actual size, multiply the result by the distance between the image and object, and divide the result by the quotient obtained by dividing the size of image by size of object + 1, squared. For instance, let D = the distance between image and object, and a = the quotient obtained by dividing image size by actual size,

$$\text{then } F, \text{ the focus} = \frac{a \times D}{(a + 1)^2}$$

Let D = 12 ins., the object measures  $\frac{1}{8}$  in., its image measures  $\frac{1}{16}$  in. then  $a = \frac{\frac{1}{16}}{\frac{1}{8}} = \frac{1}{2} = 20$ .

$$\text{Then } F = \frac{a \times D}{(a + 1)^2} = \frac{20 \times 12}{(20 + 1)^2} = \frac{240}{441} = \frac{1}{2} \text{ in approx.}$$

A. W. BULLEN and J. H. NUNN.—The peculiar appearance of the print forwarded by you was probably due to the precipitation of calcium (lime) and magnesium salts from the hard water by the developer. Some varieties of paper are particularly prone to this appearance which is no defect, and in the cases we have in view, is probably due to a peculiar surface paper and the use of chrome alum in the emulsion. All paper developed by hydroquinone should be well washed to free from developer before being put in an alum bath and then well washed before fixing, and should receive a final dip in a fairly strong clearing bath.

M. WHITEHEAD.—The only objection is that you may possibly get flare spot or ghosts when stopping the lens down for a landscape with brilliantly lit sky. We can trace no signs of any former letter.

F. R. TESTER.—(1) Over-exposed. (2) Over-exposed. (3) Over-exposed. (4) Over-exposed. All the above would have been improved by a shorter exposure and a longer development. (5 and 6) The latter is decidedly the better. Cut your exposures shorter and develop longer. Let us see some more work in a month's time.

W. P. HIGH.—Cut your exposures down and develop longer; thin sky due to over-exposure.

W. T. PHILLIPS.—We shall be very pleased to choose a lens for you and need not exceed the sum named. The fee is 2s. 6d. Let us know the greatest stretch of your camera bellows.

TYRO.—Certainly get the 8 by 5 of 9 in. focus.

H. WATSON.—The negative is a hard one and consequently the prints suffer. No. 2 is the better tone. Use your bath at a temperature of about 80 degs. F. The depth of printing is right.

T. LISLE.—Get some pure oxgall extract from a chemist's, dissolve in the proportion of 1 oz. of extract, methylated spirit 5 oz., water 15 oz., and apply with a brush to print, or mix your colours with it.

CORNWALL.—Lenses to hand. Report to follow.

PLATES.—(1) The "instantaneous" would decidedly do for landscape with moving objects,

and would require the lens to be stopped down in a very bright light. (2) The "instantaneous" are to be preferred for studio work. (3) The same as any ordinary. (4) Impossible to answer such a question as this. (5) The plates work well with hydrokinone and eikonogen.

CHAS. C. MACKLEY (Ueberlingen, Germany).—Laverne and Co., 10, Rue de Mal'è, Paris.

IRENE.—(1) We choose D. (2) No; practically of no use. (3) R will give no better definition than D at f/8.

T. A. LISLE.—The negative would have stood a slightly longer exposure or a little more developing. The result, however, of your work is excellent. We should be pleased to see some more presently.

J. A. VERNEY.—We certainly advise the tripod camera. The hand-camera would be of no use.

E. R. LOGAN.—We should place as follows—3, 1, 5, 6, 2, 4, 7. With square bellows certainly.

G. H. KIRSON.—Willsenden Paper Company, 72, Watling Street, E.C.

A.—These are very good and very convenient. We should prefer c to b or else Dewey's gem shutter, which is cheap and good.

T. B. FULLER.—The peculiar colour is due to the prolonged exposure. You are aware, of course, this is just the colour to tone well in the bath recommended.

BIARRITZ.—Your letter to hand and contents noted with thanks. We hope future questions will not be too stiff for you. Thank you for notes on "Photography in France," which we will use. You have misunderstood No. 7; we do not suggest that an emulsion is a chemical compound, though it may be compounded of chemicals.

HYPO.—The washing certainly should be sufficient, but if you will send us up a print washed as you say, we will test it for you.

BREWER.—The lens is of too long focus for general use in a hand-camera. Sell it if you like and then get a No. 3 Kodak.

WILMOT.—We received no print from you, and are, therefore, unable to answer No. 1. Send the print up and we will then answer. No. 2. Send a list of all the books and we will place in order. No. 3. We recommend a two-fold, though the three-fold would perhaps be more convenient for you to carry, and there is really little to choose between them. No. 4. Cut some strips of stout tinfoil, the required width and paste on to the edges of negative. No. 5. We should certainly recommend the more expensive salt. No. 6. Let us know approx. size of dogs—or breed would be guide enough—and also focus of lens.

H. W. A.—The cause of the stain is certainly the long washing you give. Use your hypo bath double as strong, viz., 20 per cent., then give wash for two hours in running water, and then six changes of water during the next hour.

C. CHURCHILL.—Mr. Wall has abandoned the use of formic acid because of the staining power. Add 1 oz. of sulphurous acid. Use a chrome alum clearing bath.

A. C. KING.—Your MS. duly received. We may use the same in the Reporter.

F. C. BARTON.—Report shall be sent next week.

F. A. EDEN.—Will send criticism upon your albums next week.

HAMISH.—In the following order—3, 1 and 2, and to the other question we would answer B, C, A.

HEMO.—We insert as a query; no doubt some one having had experience in South Africa. Perhaps you would call upon us some Monday afternoon before you go out.

H. D. GOWER.—Letter noted. Will try and devote a little more space to your society in future.

E. SMITH.—Many thanks for letter. Always glad of your kind help.

A. BROAD.—The communication duly received. Hope you will soon muster up courage enough.

W. O. HEMMONS.—We reply to you by post.

## Quarterly Examinations in Photography.

### QUESTIONS.

10. What are the leading factors which regulate the duration of exposure?
11. Is there any difference between wet plate and dry plate development; if so, what?
12. Describe the use and action of a swing-back.

(Latest Day for Answers—February 16th.)

### RULES.

1. Answers must be received on the morning of the Monday week following the publication of the question.
2. All answers must be preceded by the question,

and should be written on one side of the paper only.

3. A *nom de plume* may be used, but in every case the full name and address must also be given.

4. Answers must not exceed 250 words, unless otherwise stated by the examiners.

5. Those desirous of competing must apply to have their names entered, as these examinations are intended to encourage the study of the theory and practice of photography. Authorities upon photographic matters and contributors to the photographic journals will not be allowed to compete.

Marks will be given for all answers, and when possible, the three best answers will be published. Three prizes will be awarded at the end of each quarter.

All communications to be addressed to:—

"EXAMINATION DEPARTMENT,"

AMATEUR PHOTOGRAPHER,

1, CREED LANE,  
LONDON, E.C.

## Monthly Competition.

### No. XXI.—ANIMALS AND INSTANTANEOUS.

#### Title of Photograph.

	By Whom Sent.
Fritz	T. K. Fairless.
Outward Bound	Dr. E. W. Alabone.
Midland Railway, near Hampstead	A. L. Spiller.
On the River Lea	G. Freethy.
Sitting for His Portrait	F. James.
The Countenance Open, the Thoughts Concealed	H. E. Lancaster.
A Rural Feast	John Seed.
Expectation	O. Buttanshaw.
s.s. <i>Isanhoe</i> at Corrie, Isle of Man	A. C. Hunter.
Before the Wind	O. H. Davis.
Waiting for His Rider	Miss Dilton.
A Pet	D. Forbes.
A Showery Evening	J. M'Keogh.
Warleggan, Cornwall	Rev. G. E. Hermon.
Going to the Fair	J. White.
Waiting for the Milkmaid	E. C. H. D'Aeth.
Three Jolly Dogs	Mrs. Cleasby.
Lurline	T. Melsaac.
Whiteface	W. Smith.
Harvest Field, Fifehire	W. W. Ritchie.
Jeff	H. P. Holmes.
In Rear of the Column	T. Grievie.
The Danger Unseen	A. W. Gottlieb.
The Morning Bath	Miss H. Annesley.
Dinner Time	R. W. Copeman.
Henley Regatta	C. F. L. Barnwell.
Cattle Fair, Amsleg, Switzerland	Mrs. F. W. Wilson.
There and Back, 3s. 6d.	A. M. Bonn.
Major Wickman's Harriers	Mrs. Benyon.
Feeding a Chicken	W. B. Cassingham.
The Hero of a Hundred Fights	Miss O. M. A. Cresswell.
Sunset at Biarritz	C. D. D. Fothergill.
Entering Dock Barry	A. James.
Friends	T. L. Buck.
170 Stone	Miss Clark.
A Thoroughbred Yearling	W. R. W. Shand.
Paddy	W. T. Barton.
The Favourite	F. Barnby.
Foxhounds	H. Molyneux.
The Last Load	A. Brooker.
Monkstown Regatta, 1890	W. R. Atkins.
In Shanklin, Isle of Wight	C. W. Bassano.
Sheep	F. Woodruff.
On the Sands, Bridlington Quay	T. Holtby.
We Three	E. H. Gilbert.
Prize Southdowns	H. H. Hammon.
The Emperor's Pages	Miss F. S. Stone.
Sienese Oxen	T. Langton.
Putting the Stone	A. R. Dresser.
The Home Farm	C. J. Cave.

## Sale and Exchange.

**RULES.**—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny Stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

**REPORTING UPON APPARATUS.**—The Editor of the AMATEUR PHOTOGRAPHER will be pleased to report, to any intending purchaser, upon apparatus, etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the SELLER to him to the offices of the AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL,

LONDON, E.C., free of charge. The intending BUYER to pay a fee equivalent to a commission of 2½ per cent, the minimum fee being 2s. 6d., upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the SELLER. As far as possible, the Editor will undertake to send a report within TWO DAYS of receipt of goods.

#### DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

"Amateur Photographer," 107 numbers, from 101 to 303, clean, unbound; what offers?—Perry, 107 Farrant Avenue, Wood Green, N.

"Amateur Photographer," etc.—What offers for vols. viii., ix., xi., and xii. AMATEUR PHOTOGRAPHER, 20 6d. parts "Camera" magazine, first 16 7d. parts Cassell's "Cathedrals, Abbeys, and Churches," 7 sevenpenny parts "Countries of the World," five 7d. parts "Science for All," Stereoscopic Co.'s magnesium flash-lamp (3-wick), cost 5s., also one pair quarter match planes, quite new? Letters only.—T. C. Hosking, 35, Paulet Road, Camberwell.

Banjo.—Fine 5 stringed instrument, nickel-plated hoop, ivory keys, in condition good as new, in appropriate case, with spring lock and key; cost £5 10s.; price £2.—Mumby, 11, Alfred Place, W.C.

Cameras, etc.—Half-plate camera, two double backs, sliding stand, case, good condition (Fallowfield, maker); 65s.—Hugh Brown, Lyncroft, Braine-tree.

Instantograph, Lancaster's latest (camera only), with one D.D. slide, and set of three Tylar's metal dark-slides, with adapter for same, lot £1 10s.; sliding tripod, cost 15s., sell 8s. 6d.; also solid leather velvet-lined case, whole plate, cost 35s., sell 22s.; all, quite new and perfect; may be seen by appointment.—Letters to H. H., 30, Roupell Street, Lambeth, S.E.

Stereo camera, brass-bound (by Hare), long extension, with six double backs, in leather case, in perfect order; cost £15.—Capt. de Crespigny, Werge's Photographic Stores, Berners Street, Oxford Street, where camera can be seen; price £5.

Cameras, Lenses, etc.—For sale, first-class whole-plate camera, conical bellows, reversible back, rising and horizontal front, three double dark-slides, R.R. lens, 9 by 7, in splendid condition, tripod, and leather bag to camera, only been used once; cost £20; take £12; a bargain.—Address, T. L., 11, Eton Villas, Harlesden, N.W.

Splendid half-plate camera, removable stereo division, three double backs, canvas case, £1; Fallowfield's whole-plate W.A. lens, 3.5, great bargain; see these.—Werge's Photographic Stores, Berners Street, Oxford Street.

Lancaster's 1891 International half-plate camera, three double backs, tripod, 7 by 5 Optimus R.R. rapid view lens, both iris diaphragms, Gem drop shutter, time and instantaneous, instantaneous shutter for view lens, finder, and case, complete, new this year, only used twice; £9; cost 10 guineas.—E. Phillips, Leatherhead.

For sale, quarter-plate camera, all movements, extension 22 in., rectilinear lens, shutter, tripod five double slides, and view-finder; £1 15s., or will exchange good detective.—Wall, 8, Crescent, St. A. d.

For sale, Lancaster's Instantograph camera, lens, shutter, stand, three double backs, all new; price £4.—Metcalfe, Rodley, Leeds.

Obadwick's 6 by 4 stereoscopic camera, 12 Barnett's slides Wray's 5 in. and 7 in. stereo lenses, Thornton-Pickard shutter, and number of accessories, all new last July; ready for selling, obliged

give up photography.—Write for particulars to No. 107, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

18 by 14 enlarging camera, in unvarnished pine, conical bellows, focussing screen, double slide, with pair of 6 in. Optimus condensers and lamp, for daylight or night work; 50s the lot; what offers?—K. 26, Radpole Road, Fulham, S.W.

Lancaster's quarter-plate Moritosa camera, complete with lens, tripod, and two double backs, in thoroughly good condition; cost two guineas; price 25s.—S. Rossiter, Fernham, Paignton, Devon.

Lancaster's half-plate 1890 Instantograph, side, and tripod, fitted with Optimus R.R. lens, not soiled, only used a few times; £35s.—C. Hall, Bradmore House, Chislewick Lane, London, W.

Condensers, etc.—Condenser 10 in., two lenses, mounted on mahogany base and iron standards, also enlarging camera, 12 by 15, with carriers to quarter-plate; £7 7s.; or sell separately. Can be seen at the offices of the AMATEUR PHOTOGRAPHER.—W. Wells, 14, Girdler's Road, West Kensington.

Hand-Camera.—Kodak, No. 1, in perfect condition, used very little, owner buying larger one; cost £5 5s.; what offers?—Sargent, 4, Seville Street, Lowndes Square.

Hand-Cameras, etc.—Rouch's Eureka hand-camera, quarter-plate, horizontal and vertical finder, detachable changing back, adjustable shutter, solid leather case, £6 5s.; alpenstock tripod, 15s.; Ransom's copying table, £1 (10 by 8); whole-plate Eastman's roll-holder, as new, £3 15s.; Hae's candle lamp, 15s.—Dr. Winter, 4, The Birklands, Hilsae.

Hand-camera, automatic changing, holds 12 quarter-plates, with lens, shutter, etc., complete, price 4 8s. 6d.; whole-plate bellows camera, long extension, all movements, one double back, price 70s.—T. Mercer, 11, King Street, Sparkbrook, Birmingham.

Lanterns.—Lantern, optical and enlarging combination, by good maker, strong and cheap.—Reynolds, 17, Camberwell Station Road, S.E.

First-class binocular lantern, with all accessories, cylinders, etc.; cost over £40; sell for £24; full particulars.—Edward Dyson, Sharnbale Lane, Huddersfield.

Lenses.—Dallmeyer's half-plate triplet lens, very good condition, cheap; 50s., or offers.—H. Cooke, 3, Weekday Cross, Nottingham.

Pair Optimus 5 by 4 lenses, Euryscope, for stereoscopic work; price £1 15s.—Taylor, 75, Huddersfield Road, Dewsbury.

Dallmeyer's 6 by 5 R.R. cost £5 10s.; Wray's 4 in. W.A.R. cost £1 15s.—Offers to No. 107, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Lenses, etc.—Half-plate rapid doublet lens, French, no stops, splendid definition; approval; 15s.—J. Kirkpatrick, Painter, Helensburgh.

Rapid rectilinear lens, half plate, movable hood, Waterhouse stop, suitable for either film or portraits, focal length 8 in., clear definition; lowest 27s. 6d.—Thurston, 23, Gt. St. Paul, Victoria Park.

Excellent English rapid rectilinear lens, 10 in. focus set of diaphragms, good condition; 30s.; approval.—D. Padgham, Northiam.

5 by 4 Euryscope, f/6 lens, Waterhouse stops, bargain, 18s.—R. Henry, 2, Hawthorn Villas, Slad Road, Stroud, Glos.

Levi's portrait lens, 15s.; lantern objective, 10s.; Lerebours and Secretan's quarter-plate portrait lens, 20s.; quarter-plate portrait lens, 15s.—F. R. Upcott, 135, Brigstock Road, Thornton Heath. (Can be seen at the offices of the AMATEUR PHOTOGRAPHER.)

Sets.—Complete half-plate set, including double extension camera, with sliding back and all latest movements, three double dark-slides, in perfect condition, improved rigid telescopic tripod, with table top, first-class R.R. lens (by Price, Talbot, and Co.) quite new; price £6 6s.—C. H. G., 15, Playsey Road, Catford, S.E.

Underwood's quarter-plate set and shutter; exchange with cash for hand-camera (Calmer pre-

ferred) or offers in cash; approval.—Tucker, Gloucester Road, Teddington.

Sundries.—Large toning dish, quarter and half plate printing frame, lamp, quarter-plate box, quarter and half plate tray, pack of bromide paper, whole-plate, squeegee, cutting shapes, quarter and c.d.v. focussing glass; lot 10s.; bargain.—Daniel Clark, Summer Street, Slip Road, Luton.

For sale, light waggonette, and silver-plated harness, double bicycle, convertible, 14 ft. sailing canoe, 54 in. bicycle, balls everywhere, typewriter, 10 tons good Lucerne; offers wanted, or exchange.—G. S. Cousins, Birchington-on-Sea.

8 packets Paget Priz quarter-plates, 1888 XXX; would exchange for Wall's "Dictionary," Eastman bromide paper, half-plate Ilford's.—M., 21, Osmaston Street, Derby.

#### WANTED.

Burnisher.—A small burnisher. Apply to S. Kirkham, Court Place, Carlrow.

Cameras, etc.—Small camera, with stand, etc., complete; will exchange magnificent Gem air-gun, with case, slugs, darts, and tweezers, complete; cost £2, almost unused, range 200 yards; approval on both sides.—F. T. A., 13, St. James's Road, Kingston-on-Thames.

Cameras, Lenses, etc.—Good modern camera, lens, tripod, etc., complete, in exchange for very good violin, or Ruskin's works, complete set; give particulars.—O. G. Mackay, Lochcarron, Ross-shire.

Dark-3 slide.—Dark-slide, not less than 18 by 18, perfect; state lowest price; approval; deposit.—Morhead, 30, Rosemary Street, Belfast.

Hand-Cameras.—3½ by 3¼ Kodak, or Facile, or stereo camera.—Hummel, 2, Thomas Street, Newcastle.

Swinden and Harp's, Facile, Eureka, or any good hand-camera, must be in good condition and cheap.—F. Gregg, 41 Cricketfield Road, Clapton, N.E.

Griffiths hand-camera, or any other, perfect; will exchange 10 parts Cassell's "Popular Gardening," 20s.; volume "Kew Dictionary," 8s. 6d.—Watson, 18, Smeaton Street, Battersea.

Hand-Cameras, etc.—First-class quarter hand-camera, or lens for same, 54 in.—Longden, Wharfedale Chambers, Bank Street, Sheffield.

Lantern.—First quality Lancaster enlarging lantern, 6 in. condensers, or Hughes' bijou half-plate ditto.—M. Bett, Hazel Bank, Sydenham Hill.

Lantern Slides.—To purchase second-hand lantern slides, also coloured slides of stories, etc. Good binocular and 12 by 10 R.R.—W. V. Morris, 34, Parade, Cork.

Lenses.—4 12 by 10 lens, R.R., good maker.—G. J. Cousins, Birchington-on-Sea.

Euryscope and wide-angle lens.—Particulars to A. D. Clarke, Paignton, Rugby.

Outfit.—Quarter-plate outfit, by good maker, cheap for cash; also Rouch's quarter hand-camera and Watson's outfit tripod.—No. 103, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Roller Slide.—Eastman's roller slide, 5 by 4, latest, must be cheap.—Osborn, 4, Lansdown Road, Tottenham.

Set.—Good half-plate set, three slides, lens optional, cheap.—86, Albert Road, Croydon.

#### Lantern Slide Exchange.

NOTE.—There is NO CHARGE for insertion in this column. All announcements must be received by Tuesday morning.

S. L. Coulthurst, 78, Collyhurst Street, Manchester, wants slides of Belfast, Antrim coast road, Portrush, and Coleraine to complete set; offers in exchange, cattle, shipping, Cheshire, or other Antrim slides.

#### NOTICES TO SUBSCRIBERS.

Subscriptions must be prepaid.

UNITED KINGDOM .....	Six Months, 5s. 6d.	Twelve Months, 10s. 10d.
POSTAL UNION .....	" " 6s. 6d.	" " 12s. 0d.
INDIA, CHINA, ETC. ....	" " 7s. 6d.	" " 15s. 2d.

#### NOTICES AS TO ADDRESS.

PUBLISHING DEPARTMENT.—All letters containing Subscriptions, Orders, Remittances, SALE and EXCHANGE Advertisements, or other business matters for the Amateur Photographer are to be addressed to the Publishers, HAZELL, WATSON, AND VINEY, LD., 1, CREED LANE, LUDGATE HILL, LONDON, E.C.

NOTE.—SALE and EXCHANGE Advertisements, at the charge of Three Words for One Penny, can be received as late as WEDNESDAY MORNING.

ADVERTISING DEPARTMENT.—All communications respecting Trade Advertisements in the Amateur Photographer are to be addressed to PERRY AND CRAWFORD, 1, CREED LANE, LUDGATE HILL, LONDON, E.C.

NOTE.—Trade Advertisements are received up to Tuesday morning.

EDITORIAL DEPARTMENT.—All Literary Contributions, Queries and Answers, Photographs for Competition or Criticism, Books or Apparatus for Notice or Review are to be addressed to the Editor, Amateur Photographer, 1, Creed Lane, Ludgate Hill, London, E.C.

NOTE.—To ensure insertion, all Communications should reach the Editor on Tuesday.

#### ENLARGING MADE EASY

BY SHENSTONE'S

#### PATENT ENLARGING LANTERN & STAND

Will give any size Picture from any size Negative. Can be used for reducing to Lantern Slides, and for Copying BEST IN THE MARKET.

Price £5 10s. complete.

THE AMATEUR PHOTOGRAPHER Monthly Competition No. 21, "Animals, Instantaneous, etc.," has only resulted in some forty or fifty prints being sent in. We have awarded the prizes as follows:—

*First Prize (Silver Medal).*

A. BROOKER. . . . . Hastings,

for a very excellent photograph, "The Last Load." In this picture we have four Sussex oxen yoked to a waggon which is being loaded with rough grass, rushes, etc. A Ross P.S. lens of 10 in. focus was used, working at  $f/22$ , and a slow exposure given to an Ilford rapid plate, with Place's shutter. The print, which is toned to a warm sepia, is on home-sensitised rough Whatman paper, of, if anything, rather too rough a surface. In some lights the effect is admirable, but still to our mind the surface is a trifle too much broken up. This picture would, in the ordinary course, be used as the frontispiece for the March number of the *Photographic Reporter*, but we very much regret to say that in transit from Mr. Brooker to us the negative has been smashed,

although it was packed in a cardboard box. Valuable negatives should always be packed in wooden boxes.

*Second Prize (Bronze Medal).*

MISS F. T. STONE . . . . . Florence.

The print which receives this medal is one of the best specimens of instantaneous work we have seen for some time, and gives a view of the Emperor of Austria's footmen who formed part of the Corpus Christi procession on June 6th. There is good definition of the faces from one side of the plate to the other. The negative was taken with a Steinheil lens.

*Equal Second Prize (Bronze Medal).*

MRS. E. A. CLEASBY . . . . . Brecon.

This is a study of three dogs—a collie, a poodle, and a rough terrier—sitting on a garden seat, taken with a Ross R.R., U.S. 16 stop, on a Paget's xxx Prize plate. The picture has a comical effect, but shows signs of considerable care and patience.

Mr. H. C. Lancaster (W. Kensington) sends a study of sheep, entitled "The Countenance Open, the Thoughts Concealed," taken with a Wray lens,  $f/16$ , on an Ilford ordinary. It is a charming little piece of composition. "In Rear of the Column," by T. Grieve (N. Shields), a print of a large number of young ragamuffins standing round a military cart containing refreshments, is very good. It was taken with a Dallmeyer R.R., stop 3, on a Mawson plate. Mr. W. R. W. Shand (Chester) sends an excellent though small picture of a man and thoroughbred yearling, taken with a Rouch lens,  $f/8$ , with one-eighth of a second exposure. The platinum print sent in is very soft, and does great credit to the worker. Mr. C. H. Davis (Richmond) sends a charming little grey Aristotype print of a barge sailing "Before the Wind," taken on an Ilford special plate, with an R.R. lens. The sender remarks that the shot was taken with an "Eclipse" camera from the deck of a passing steamer.

We would remind intending competitors that the slides for the second Monthly Lantern Slide Competition have to be sent in on or before the 19th inst.; subject, "Portraiture and Figure Studies." The competitive slides will be passed through the optical lantern at our offices on the evening of Monday, the 23rd inst., commencing at 6.30 p.m. Competitors and subscribers will be admitted on presentation of visiting card.

WE note that at the last meeting of the West Kent Amateur Photographic Society, a resolution was passed to admit amateur photographers living at a distance to become members on payment of half the annual subscription. Members elected under these rules have no vote. The district from which it is sought to secure additional members is Lee, Eltham, Crayford, and Dartford.

It is, as will be seen in our correspondence columns, proposed to form a photographic society for Shoreditch and district. We also understand that steps are being taken to start an amateur photographic society at Pudsey.

A COMPETITOR in our recent Lantern Slide Competition who was awarded a second prize, in acknowledging the receipt of medal, writes as follows:—"It is a work of art and worthy of its donors. Although it is the *first* I have received and also the *last*, I hope it is not the *last* I may receive; and as my *first* was a *second*, I live in hopes that my *second* may be a *first*."

At the last meeting of the Worcester Amateur Photographic Society a paper was read upon "Composition as applied to Pictorial Art," by Mr. W. A. Firkins. At the same meeting the American slides sent to this country by the Boston Camera Club were shown.

THE Enfield Camera Club now numbers thirty members. It has only been established eleven months, has promoted a capital exhibition, and as there are in the immediate neighbourhood of Enfield many beautiful bits of scenery, we should say that amateur photographers will increase in numbers, and many new members will be added to the club. The President, Mr. D. G. Pinkney, is a careful worker, and is already an AMATEUR PHOTOGRAPHER medallist. Mr. J. Dudin, the courteous Honorary Secretary, will, we feel sure, ere long secure the same distinction, as he is a most painstaking photographer.

AN exhibition of work by the members of the Manchester Amateur Photographic Society has been held in the Athenæum Lecture hall. The members, 400 in number, contributed no less than 700 pictures. The *Manchester Examiner* says:—"As examples of photographic art they show a decided advance on any previous exhibition by this society. Taken altogether, they may perhaps be regarded as the best collection that has yet been seen in Manchester. Almost every type of photography is represented, and it is noticeable that the members have kept pace with the development of the art. The Exhibition is conspicuous for its absence of anything which may fairly be described as amateurish, although, of course, the members cannot be classed among the ranks of professionals. Composition and method have been studied with marvellous success, and the result is a collection of photographic prints which it will be difficult to excel."

THE *Glasgow Evening News* says—"The book-canvasing fiend is simply not in it with the new photograph terror, who is at present bringing gaudy prints and woe into the homes of harmless citizens. His dodge is to get on the track of a popular minister with a good class congregation, secure a photograph of the divine, get 200 or 300 large-sized copies printed and put in cheap German frames. Securing the names and addresses of the members of the church, he goes forth with a sample, and scoops in an enormous profit from enthusiasts—principally ladies—who

pine to have the presentment of their spiritual adviser stuck in the parlour opposite the oil portrait of the 'guidman.' Transactions are all in cash, and though sometimes the pictures are fairly good, they are more often the merest rubbish. One enterprising canvasser of this stamp got an old church officer to write out 300 names and addresses from the Session books for him, and now the unfortunate congregation are pestered to death with his attentions."

THE following statement, which appeared in one of the daily papers, contains but very poor comfort for those desirous of seeing the introduction of a decimal system of weights and measures:—"The Chancellor of the Exchequer, writing to Mr. Long, M.P., acknowledging a memorial from the Dundee Chamber of Commerce, says: "I must own frankly, for myself, that though I am sensible that powerful arguments can be put forward in support of the decimal system, I cannot undertake to recommend its adoption to the country." As our readers are aware, amongst photographers, both amateur and professional, the tendency for some time has been towards the use of the decimal or metric system of weights and measures, thus avoiding that confusion which arises in photographic formulæ when given in ounces. There is, we believe, a society in London which has for its particular aims the furtherance of the adoption of the decimal system generally, and it is now preparing a memorial for the teaching of the same in Board Schools.

AN exhibition of pictures has been held in the rooms of the New York Camera Club, consisting of sixty-four photographs by Mr. H. P. Robinson, and twenty-two by Mr. John E. Dumont.

It is proposed to form a camera society at Newport, S. Wales. Rules have been suggested, and Mr. F. Parsons, Queen's Hill, Newport, who is acting as provisional Honorary Secretary, will be pleased to forward a proof slip to anyone who may be interested in the movement.

LAST Friday Lord Rayleigh gave a lecture at the Royal Institute, on "Some Applications of Photography."

CONSIDERABLE misconception seems to have arisen as to the position we have taken up with regard to the forthcoming Photographic Exhibition to be held in Vienna. The letter which appeared in our columns of January 2nd (p. 8) drew from us an editorial note, and we there stated that "our columns were, of course, open to reply." In our issue of January 23rd (p. 56) Herr Srna, President of the Vienna Club of Amateurs, replied, but we are compelled to state that, in our opinion, it was in an unsatisfactory manner. Herr Srna said that the Club consider "a passage requiring an express declaration as to how much of the work the exhibitor himself has done as a degradation, nay, well-nigh an insult, for amateur and professional alike." In our issue of February 6th (p. 89) the writer of the original letter of complaint answers Herr Srna, and in a long letter, which our readers can easily refer to, states, "My letter had one main object; it was a protest against the admission of work into a competition arranged by amateur photographers, which is not entirely the work of the exhibitor, viz., from the exposure, through development, retouching, printing, toning, and mounting, to the finished picture. In order to enforce this, I considered it my duty to direct the attention of English amateurs to this point." This is practically the bone of contention, and it is in support of this clause that we have given expression to our views in the past and still

continue to do so. We, the AMATEUR PHOTOGRAPHER, were the first to initiate and insist upon the work of exhibitors being *entirely their own individual work*; and we shall in the future still insist most rigidly upon the compliance with this rule for any of our own competitions. That our endeavours have not been in vain is proved by the fact that this is an established rule at the leading exhibitions now held in this country. Let us take the forthcoming International Exhibition at Liverpool, and we find in the "conditions" the following :

"In signing Form B, the following condition is strictly imposed on all competitors in classes 5 to 27 inclusive, viz.—That the photographs are declared to be the entire work of the exhibitor, as regards *posing and selection of subject, exposure, development, retouching, printing, and toning*. It will be observed that this condition is not imposed on exhibitors in classes 1, 2, 3, and 4.

"N.B.—In the case of firms or companies, the exhibitor must be the actual operator (working partner or assistant, as the case may be) who has performed the entire work as above described.

"In consideration of the foregoing restriction now introduced for all work put in competition (portraiture excepted) a section is reserved for trade exhibits purely for exhibition, for which there are no awards, nor yet restriction as to production of the pictures, which may be coloured or otherwise. This section is mainly intended for the large limited companies."

Now, we believe that before this condition was included in the regulations the proof or suggestion was submitted to some of the leading professional and amateur exhibitors of England, and that their opinion was decidedly in favour of the inclusion of such a clause. We will ask our readers to consider two cases—one, that of an amateur exhibitor, who poses, exposes, develops, prints, tones, and mounts his exhibit himself; secondly, that of a professional who poses and lights a sitter, whilst his chief operator exposes, another man develops, another retouches, another prints and tones, and another mounts the picture. Would it be fair to present these two works side by side in one class for any judge's verdict? We say, certainly not. In the case of the first there is not the slightest doubt that the operator deserves any medal awarded him, whilst in the second it is very doubtful as to who is the actual operator; certainly not, in our opinion, the man who poses and lights the sitter, as this does not make the picture, which is the result of many experienced and, it is to be presumed, expert hands, who are specialists in that particular department of work assigned them. We believe that in a case of copyright tried some years back, the judicial mind fully recognised the difficulty, and expressed the opinion that the actual operator was the man who did the work, not the man who took the money for the resultant picture.

This, then, is the position we have taken up, and the opinions that we hold of any exhibition to which our English exhibitors are invited to compete. That an honest amateur, at once an artist and master of the technique of photography, has nothing to be afraid of in such a clause is only too evident from the fact that there are many who have carried off medals against some of the leading professional exhibitors in this country, and it is only fair to demand from the professional who makes his living from photography, that he shall do as much for his own exhibit as the amateur who works merely as a dilettante.

We have now received the prospectus of an International Exhibition of Photography, to be held at Brussels, under the auspices of the Association Belge de Photographie, but in the regulations of this, as in those of the Vienna Club of Amateur Photographers, there is no mention of any restriction such as that for which we have so strenuously striven, and still continue to uphold, as the only satisfactory basis on which to form an international exhibition open and equally fair to both professional and amateur.

### SIMPLICITY.

It is almost impossible to make any close examination of the photographs which are to be seen gathered together at the various exhibitions, or, if the list of one's acquaintances includes many disciples of the camera, to inspect the kit they consider necessary for the practice of their art, without being struck by the fact that the beauties and advantages of simplicity are not appreciated to the extent that their importance would fully justify. In the pictures that amateurs of ordinary attainments consider worthy of public notice, and which they accordingly send to adorn the walls of this or that gallery, the want of simplicity is accountable for a great deal of that adverse criticism from art circles which is constantly being hurled at photography. Seeing the same fault at every turn, and rarely meeting with work wherein it is not painfully in evidence, the critic is apt to generalise and blame the art where he should with much more justice blame the worker. Again, much of the outcry against the photographic lens for that superabundance of detail which is so revolting to the impressionist school—or rather we ought, perhaps, to say, to those who think they are entitled to the distinguishing appellation of "naturalists," for with this misnomer they appear content—is occasioned more by the want of simplicity in the subjects chosen for photographic picture purposes, than to the fineness of the definition with which they are portrayed; simplicity in this connection being used as a distinguishing word opposed to complexity in the incidents or objects within the compass of the picture. "Get as much for your money as you can," which is apparently the motto of the age responsible for "sweating," appears to be one which, with slight alteration, amateur photographers have appropriated for their guiding principle. "Get as much on your plate as you can" may be a very good rule for a schoolboy, but, with a slight variation in meaning, it is about as bad a one for a photographer as can well be made. It is responsible for the greater portion of those sins of omission and commission against the elementary rules of art which photographers are so constantly perpetrating. It is next to impossible to have all the incidents in the scene when it is on any extended scale in correct position, or so placed that the important features of the picture are not dwarfed, or so depicted that they fail to assert that prominence which they ought correctly to be accorded. The mind is distracted; the eye, instead of gliding imperceptibly from one point to another, passes over the picture with a series of jerks which utterly preclude that repose being felt which should be possible with all work entitled to be classified as artistic. If the paintings of renowned artists are to be chosen as models for the photographer, from which to learn the beauties of successful composition and management of lines, then most certainly he must recognise the fact that the limitations of his art should prevent it from being used to produce scenes which in any way resemble "The Derby Day," or "Railway Station" class of picture. Simplicity, and its concomitant result "breadth," should be the characteristic features of photographs; then the drawbacks that are supposed to ensue from the wealth of detail which the plate records would not be so conspicuous, nor would the excessive detail assert that painful aggressiveness which in the general work of photographers, it must be confessed, is too often apparent.

Then, again, leaving the domain of simplicity in the subject of the picture, many amateurs fail to recognise the advantages which can be personally conferred by learning how to simplify the apparatus which the practice of their art necessitates, or that can result from acquiring the skill of being independent of many of those odds and ends which certain workers regard as necessities. A light camera with

simple adjustments, and a light bag in which to carry it, are luxuries which are not sufficiently appreciated. Such adjuncts as levels, eye-pieces, exposures tables, view-finders, and numerous other additions to the impedimenta which some amateurs consider indispensable should be banished. They are only mechanical aids to doing work which the senses are quite capable of accomplishing without their assistance. They are crutches on which to lean, and no one who is not crippled mentally need resort to them. Moreover, by placing reliance upon instruments of this character the faculties become so weakened by want of use that in the end the power of dispensing with such implements becomes impossible. The eyes, if the amateur gives them any training, will soon do correctly all the work which is necessary where the camera is being employed. They will select the scene so that it composes well without a view-finder, they will detect false perspective on the ground-glass screen without a level, they will gauge the light near enough to fix the duration of the exposure without sensitometers or similar articles, and they will regulate the degree of sharpness in the focussing without the use of a magnifying eyepiece. To be able to simplify all photographic manipulations, and to work independently of such innumerable mechanical aids, add considerable charms to the practice of the art, and deprive it of much of that trouble which many workers find so irksome, so that it is worth while for all true disciples of the camera to give some attention to studying the question of simplicity with respect to apparatus, as well as to other matters in connection with the art-science.

Our remarks in connection with this subject of simplicity could be very much more extended by drawing the attention of our readers to the advantages that can accrue from practising this virtue in their dark-rooms. For ordinary work in connection with the production of the negative and the various printing methods in general use, but few chemicals are absolutely necessary. The complicated formulæ so often advocated by a certain section of photographers can create no better work than is produced by men who decline to resort to the method of photographic manipulation which requires the conversion of their dark-rooms into miniature chemists' shops, but acquire the skill of making the sensitive plate yield up its secret by more simple expedients. By carefully studying the power which each ingredient in their developing formulæ can exert, and by thoroughly mastering the technicalities of development, the fact becomes impressed upon the mind that intelligence in connection with three or four simple chemicals is all that is absolutely requisite for a photographer working under ordinary conditions. And by simplifying matters in this manner a greater control can soon be gained over the character of the work produced than if the worker resorts to more complicated methods, which entail his using ingredients whose powers are beyond his ken and therefore necessitate that "trusting to luck" which is unfortunately only too prevalent a characteristic of many amateurs when developing. Of course, when the beaten path is left and the object of the photographer is more in the nature of experimenting or making research than the production of photographic pictures, then our remarks are not applicable; but in the other event, then we do not consider we can give better advice than to urge those who have only the one object in view, and especially if they are far from proficient in the practice of their art, to abandon the idea that any very extended use of chemicals is a *sine qua non* of photography. Simplicity in this respect also will be found a virtue worth acquiring, and a remembrance of this fact will add much to the comfort of the photographer, and reduce the expense which the practice of his art involves—advantages not to be despised.

## Letters to the Editor.

### THE VIENNA EXHIBITION.

SIR,—The attacks which have been made in your columns upon the promoters of the Vienna Exhibition, and the regulations they have thought it advisable to make, are, I think, very much to be regretted. The Viennese are, it appears to me, entitled to frame what rules they may think proper at their own exhibition. The terms upon which they ask us, foreigners, to contribute are extremely liberal, and we may accept or hold aloof as we please. It is surely ungraceful that their action should be criticised in such terms as those of the anonymous letter signed "An Amateur Photographer."

The writer of that letter appears to me to misunderstand entirely the aim and scope of the exhibition in his anxiety that a regulation should be framed compelling contributors to declare their exhibits to be their sole work. The exhibition, I take it, is not a competitive one arranged for beginners; for the vast multitude, in fact, who are known by the epithet of amateur (*sous-entendu*, immature). If it had been so, no doubt the regulation referred to would have a *raison d'être*. The one in question is rather of the nature of a *salon* in which it is sought to gather together the most artistic productions of photography, and in which nothing will be admitted that does not attain a certain standard of artistic quality. What exhibition of paintings or other works of art has ever, I may ask, imposed upon its contributors the signatory clause which your correspondent demands, a stipulation which, I am glad to observe, the President, M. Srna, characterises as well-nigh an insult? What is the competition "An Amateur Photographer" dreads so much? Is it not the fact that the work which is shirked by many, from their own inability or otherwise, is carried out by the employés in the studios of the photographic trade? And is it from their hands that we expect to obtain the qualities which are to receive recognition at the hands of the Viennese jury of artists?

Sir, I maintain that no photographer, capable of producing artistic pictures, who respects himself and his work would dream of committing any part of it, other than that which is mechanical, to any hands but his own. I do not allude, of course, to the ordinary print of days gone by, but to that which, allowing for all that careful and judicious development can produce, is not artistically finished on the completion of the negative. Am I to believe that such exhibitors as Davison, Sutcliffe, Wilkinson, Anstin, Burchett (to name no more) would entrust any part of their work to an employé in the establishment of a photographic dealer? Am I to believe that these men and others are afraid of the competition they would encounter there? Surely, if we may grant at all that there is any individuality in photographic art, it can only lie in him who conceives the picture. The addition made by a stranger, not to say mechanic, must be mechanical, and being so has no place, as I take it, in the programme of the Viennese Society.

Once more, let "Amateur Photographer" dismiss from his mind the idea that the exhibition is intended to be a kind of school-boy competition with a scramble for medals, and rewards for progress, and he will, I think, acknowledge how derogatory, nay insulting, it must be to demand such pledges from the artists whom it invites to contribute. We are all entitled to our individual opinion. I am sorry I cannot agree with "An Amateur Photographer." On the contrary, my hope is soon to see here an exhibition based upon such lines as those upon which I congratulate the President and Council of the Photographic Society of Vienna.—I am, Sir, yours truly, ALFRED MASKELL.

SIR,—I do not want to injure the Vienna Exhibition by the dubious blessing of my advocacy, but I think that the critics hardly do the regulations for that exhibition justice in making so much of the omission from the entry forms of a test clause as to the "production of the picture."

First of all, it would have made no improvement in the best photographs we know that more than one hand should have meddled in the production of them. As you, sir, have yourself pointed out, the photographs by amateurs stand the test in the Exhibition of the Photographic Society of Great Britain, and that ought to settle the question. Who does the printing and who does the mounting may be of importance in a beginners' competition, but as the aim of the Vienna show is to be "high-

class and artistic," only selected pictures being shown, I doubt if any unfairness will be caused or felt.

I certainly cannot understand any photographer who feels he has anything of the artist and the *amateur* in him, delegating essential parts of his work to someone else, but in competition I should certainly not feel it an unfairness that he had employed Tom, Dick, and Harry to print, retouch, and "finish" his pictures, provided a competent jury of artists were to do the adjudicating. I am, indeed, inclined to think that there is little, if any, of this discreditable kind of exhibiting or competing now going on.—I am, etc.,

GEORGE DAVISON.

Camera Club, February 6th, 1891.

#### MR. PRINGLE'S ARTICLES ON PHOTO-MICROGRAPHY.

SIR,—All microscopists must be grateful to both you and Mr. Pringle for the articles on photo-micrography that are coming out in the *AMATEUR PHOTOGRAPHER*. I trust that these articles will encourage many readers to experiment in this interesting branch of photography, as I think workers are much required.

If one considers that a large number of microscopical objects require powers of under 100 diameters to show them, and that some of the most popular ones require a magnification of from 20 to 30 diameters, it will be seen that there is a large field open which can be experimented in without going to much expense, as they are within the compass of ordinary lenses and cameras; for instance, Zeiss charges for his one inch (24 mm.) achromatic objective 27s, and for his one inch (24 mm.) apochromatic objective 140s. I may mention that Mr. Swift makes lenses specially corrected for photography, and that his inch objective costs 33s.

The class of objects I refer to are of the character of those mentioned by Mr. Cooke in his shilling book known as "1,000 Objects for the Microscope."

I regret that Mr. Pringle did not go a little fuller into numerical aperture, as the term is new, probably, to a large number of photographers, and opticians still seem to stick to angular aperture, which gives a false idea of the value of lenses. Angular aperture is the largest angle made by the rays which enter the lens from a point of an object in focus. The numerical aperture is the sine of half this angle multiplied by the refractive index of the substance in which the front lens is immersed. In a dry objective this is *air*; in a water immersion, *water* (refractive index, 1.33); in homogeneous immersion, *cedar-wood oil* (refractive index, 1.52). For instance, take an objective of 60 degs. aperture; if the lens is a dry one, the N.A. is .5; if water, N.A. is .66; if oil, N.A. is .76. The illumination of an objective is as the squares of the N.A.; and if the N.A. be multiplied by 100 this may be taken as the resolution in 1,000 lines to the inch. This is theoretical, and takes a wave length of  $\frac{1}{1000}$  in., but is easy to remember. The actual resolution is about four-fifths of this. It is well always to decide on lenses by their N.A., as an increase of angular aperture adds much to the prices of lenses, without often giving compensating advantages. It will be remarked that N.A. is something like our U.S. numbers.—Faithfully yours,

February 7th, 1891.

J. G. P. VEREKER.

#### ARISTOTYPE PAPER.

SIR,—There is one point in Mr. Greenwood Pim's letter on the above subject in your issue of 6th inst., which is calculated to cause more loss than any old toning bath, and that is the following:—"It is a great advantage to put the print, when just rinsed from the hypo, into alum. This entirely obviates the exceedingly troublesome tendency to curl at the edges." The action of alum upon hypo is, one would suppose, almost too well known to need any comment, but still once again it must be mentioned. Alum decomposes hypo, with the deposition of sulphur and oxide of aluminium and liberation of sulphurous anhydride according to the well-known equation—

One can well imagine, though one may not wish to experience, the result of such a precipitation and such a nascent gas as sulphurous anhydride on the silver image of the print. For the very same reason I have so long fought against the use of alum in the combined toning and fixing bath, and recommended the use of an alum bath and copious washing prior to toning. The average photographer, who may not know much about chemistry, is so imbued with the idea that "alum" is a necessary ingredient in the combined toning and fixing bath, that we have at the present

day *collodio* chloride emulsion papers put upon the market, for which an alum and hypo toning bath is recommended, and surely there is with a collodion paper no gelatine to harden.—Yours truly,

E. J. WALL.

\*\*\*\*\*

#### PRINTING ON ROUGH PAPER.

SIR,—Dr. Emerson, in his renunciation, refers to my use of rough drawing paper as a "revival," and Mr. Davison, in his reply, remarks that there is no novelty in the use of rough papers. I quite admit this, but papers vary greatly in the degree of roughness they possess. The paper I employ is the roughest drawing paper procurable, and the same effect cannot be produced on smoother paper. It is my impression that paper of the quality I employ was never used or suggested before the production of the photographs exhibited by me at the Pall Mall Exhibition. I may, however, be mistaken, and, if so, I trust that the gentlemen named will put me right.—I am, yours truly,

Brighton, February 7th, 1891.

W. L. NOVERRE.

\*\*\*\*\*

#### SOCIETY FOR SHOREDITCH DISTRICT.

SIR,—Believing there are many amateur photographers living in Shoreditch and the immediate neighbourhood who would be willing to give their aid and support in forming a photographic club in this district, I am desired by other gentlemen who are interested in the project as much as myself, to say that efforts will be made to form such a club providing sufficient number of names be received of those who would be willing to become members. All communications will be gladly received and acknowledged by, yours truly,

HY. GEO. WALLIS.

84, Shoreditch, E., February 9th, 1891.

\*\*\*\*\*

#### DELAYS IN TRANSIT.

SIR,—I think it is as well that all photographers who come here should know what to expect from the Algerian post-office. A roll-holder was sent out to me the 13th of December, and though I wrote and inquired about it I could obtain no tidings of its whereabouts till this afternoon, when I found it in the post-office department of the Transatlantique Company. It was directed to this hotel and marked "grande vitesse." The officials airily explained that they never delivered parcels—they must be fetched!—I remain, yours truly,

Hotel d'Orient, Algiers, February 3rd, 1891.

\*\*\*\*\*

#### ENLARGEMENTS BY ARTIFICIAL LIGHT.

SIR,—In your issue of Friday last I observe the report of a meeting of the Bath Photographic Society at which my friend, Mr. Pumphrey, the President, brought before the meeting an enlarging apparatus of my invention. I first made it known at a meeting of the photographic section of the Yorkshire Philosophical Society in the spring of last year, when I gave a demonstration. The object of the apparatus is the production of enlargements and lantern slides from half or whole plate negatives by artificial light *without a condenser*. I send for your inspection four enlargements so produced (two 16 by 12, two 12 by 10), all from half-plate negatives. Similar or larger enlargements may be made either from half or whole plate negatives with equal facility.

I have been recommended by some of my friends either to protect the invention or produce the apparatus for sale. I have no wish, however, to do so; I am rather disposed to offer it for the adoption of any who may think it worth while. The description of it in the report of the meeting at Bath is quite correct as far as it goes, but there are several matters of detail which should be known by anyone attempting to make one, such as size of chamber, mode of working in it without admitting white light, etc., etc. To any one wishing to know further particulars, on receipt of stamped envelope I shall be glad to answer any question. I may mention that the cost of making the apparatus is a mere trifle compared with that of a good condenser to cover a half or a whole plate negative. It is also available for the production of lantern slides from such negatives.—Yours, etc.,

10, St. Mary's, York, Feb. 9th, 1891.

WM. MONKHOUSE.

NOTE.—The enlargements are very fine, and Mr. Monkhouse has left them in our charge. They will be on view at our offices on Mondays, the 16th and 23rd inst.—Ed. AM: PRIOR.

## Composition, and Light and Shade.

*Selected and arranged for the use of Photographers, from "Burnet's Essays," with Introduction and Notes.*

By H. P. ROBINSON.

### CHAPTER IV.

*Fig. 5.* The original of this sketch, a small etching by Ostade, ought to be in the possession of every artist, for its beautiful arrangement of light and shade, and the skilful way in which they are woven together. As I ought to have noticed above, that the principal mass of light in out-of-door scenes (both in nature and the best masters) is generally placed in the sky, or upper part of the picture, I

FIG. 5.—A. OSTADE.

may here remark that in interiors (especially such as are constructed upon this plan) it is generally reversed, the roof and background being reversed for a mass of shadow and repose. Ostade, in his compositions, displays such ingenuity in their construction as to render his pictures an endless source of gratification and study to the artist. In some of his works, the art is so completely hid as to make it difficult to say, whether his background or figures were the first composed. We have not only objects intercepting each other in the most natural and picturesque manner, but the figures carried up against them; thus coming in contact with various forms different in size, distance, and colour. This, when done with judgment, gives a rich and inartificial effect. On the contrary, in the pictures of Teniers, we often find a number of objects cast down in one corner, evidently for the mere purpose of being painted; which, however, from their situation, their picturesque arrangement, and the mechanical skill of the execution, acquire a force, natural sharpness, and beauty that amply compensate for the ostentatious display of such excellencies. Tenier's backgrounds are also totally different from Ostade's principle; his figures being generally surrounded with blank spaces of shadow or half tint. When a story is to be told that requires the spectator to be directed to the heads and hands for expression and action, this breadth

is more allowable; but breadth, as Mr. Fuseli justly observes, ought never to have the appearance of "flatness or insipidity." It is observable that, in an exhibition where

FIG. 6.—CLAUDE.

there are a number of objects to distract the attention, those pictures please us most on which the eye is allowed to rest, from their possessing a vacant space; but those very pictures uniformly look blank and unfurnished when hung up singly in a room.

*Figs. 6 and 7.* Claude, in many of his compositions, displays very little address in bringing up his strong dark against the light. In him, it often looks like unaffected primitive simplicity; but it might not be so considered in an artist of the present day. When Claude introduces a figure for such purpose, or in order to give a retiring delicacy to his distance, we often find it of a strong dark blue, which serves also to bring down the same colour from the opposite angle of the sky, thereby producing a union between both

FIG. 7.—CLAUDE.

sides of the picture. I may notice here the length of line produced by the cattle in fig. 7, as it assists the perspective effect, in carrying the eye into the picture, serving also as

a base line for the landscape to rest upon. When the sun is placed near the point of sight, we sometimes see shadows made use of for the same purpose. A straight line is often necessary also for the sake of variety; and when architecture is not present, we must get it how and where we can.

An excellent reproduction of Ostade's famous etching will be found in Hamerton's "Etching and Etchers." This practised writer's remarks on the composition will be of interest. It must be borne in mind in reading it that Burnet's sketch of the etching is reversed:—"It is the most perfect work of the master, and quite remarkable for lighting and composition. Ostade's sense of what was necessary to the support of a group is like an instinct which led the Gothic builders to use buttresses and low chapels round their edifices, and which in nature gives artistic value to the slopes of débris at the feet of mountains. For example, in this etching the composition rises always towards the right, and is buttressed by slopes to the left. See how amply the figure of a man is supported by the boy and the dog and by the seated woman. This law of diminution to the left is carried out in the most trifling accessories, in the basins above the door, in the spaces between the three cross-pieces nailed to the beams, in the two boards near the ladder, in the openings of the bed and the door. If the woman had advanced her left foot instead of her right, the man behind her would not have been so well supported, and if the little dog had been absent, the buttressing on that side would not have been continued to the ground. The lighting is, of course, intended to give importance to the group; there are admirable reflections and transparencies in the shade."

(To be continued.)

## Chemistry for Photographers.

By C. H. BOTHAMLEY, F.I.C., F.C.S.

(Continued from page 75.)

WATER can be purified from suspended impurities by filtration (vol. x., p. 413). On a small scale, paper may be used; on a large scale, a layer of fine sand resting on a layer of gravel is generally employed. The upper part of the sand requires renewal from time to time. By using spongy iron, porous carbon, or certain other substances, part of the soluble impurities, including some of the organic matter, can also be removed, but these special materials themselves become foul, and require frequent attention. The complete removal of dissolved matter can only be effected by distillation, and since this method is used for the purification of other liquids, as well as of water, a detailed description will be given.

*Distillation* is a process in which a liquid is converted into

FIG. 23.

vapour in one part of an apparatus, and the vapour is collected and condensed back to a liquid in another part of the apparatus.

The vessel in which the liquid is boiled is called the *retort* or *still*; the apparatus in which the vapour is cooled is called the *condenser*; and the vessel in which the condensed liquid collects is called the *receiver*.

Fig. 23 shows an ordinary glass retort with a receiver. The neck of the retort acts as the condenser, and is kept cool by the action of the surrounding air, this action being assisted, if necessary, by placing round the neck a piece of

filter paper, which is kept continually moist. To ensure complete condensation, the receiver is placed in cold water.

Fig. 24 shows the apparatus known as a Liebig's condenser. The flask A, which acts as the retort or still, is connected by means of a cork with a long tube, which passes through a wider tube. The space between the two tubes is

FIG. 24.

filled with cold water, which flows in constantly at the bottom, through the tube B, and out at the top, through the tube C, and the condensed liquid drops into the receiver D.

Fig. 25 shows a larger apparatus, capable of distilling considerable quantities of liquid. A is a tin can, holding two gallons or more, B is the worm or condenser, constructed preferably of block-tin if water is being distilled, but of glass if the liquid will act upon metals, and placed in a tub of water.

In all cases care must be taken that the liquid does not boil so violently that portions of it are projected into the condenser.

Simple distillation will yield water pure enough for most

FIG. 25.

purposes, but when particularly pure water is required some water which has already been distilled is mixed with some potassium permanganate and caustic potash, and is again slowly distilled, the first third being thrown away, the second third collected for use, and the remaining third left in the retort or still. The water must be collected and preserved in perfectly clean glass vessels provided with well-fitting glass stoppers.

Reference has already been made to the great solvent powers of water, and it will be convenient to consider here the laws which regulate the solution of substances, not only in water, but also in other liquids.

**SOLUTION** denotes the perfect admixture of a solid, gas, or a second liquid with a given liquid, so that it forms part of the latter and yields a homogeneous product, the constituents of which show no tendency to separate again so long as the conditions remain the same.

**EXPERIMENT 93.**—Shake a few crystals of potassium iodide with some water in a test-tube; observe that the iodide disappears and shows no tendency to separate when the liquid is allowed to stand. Place the liquid in a dish, and heat it on a small water-bath; the water will volatilise, and the potassium iodide will be left behind.

Whenever a solid, gas, or a second liquid becomes intimately mixed in this way with a particular liquid, it is said to *dissolve* in it and form a *solution*, the particular liquid being called the *solvent*. The solubility of the substance is measured by the quantity of it dissolved by 100 parts of the liquid, or by the quantity of it contained in 100 parts of the solution. It is important to be quite clear as to which

mode of statement is used, for obviously the numbers will not be the same in both cases, although they represent the same proportions of the substance and the solvent.

For instance, at the ordinary temperature, 100 parts of water dissolve 36 parts of common salt, *i.e.*, 136 parts of the solution consist of 100 parts of water and 36 parts of salt. We may state the same result by saying that 100 parts of the solution contain 26.5 parts of salt.

The solubility of a given substance in a given liquid depends in the first place on the nature of the substance and the nature of the liquid. Some substances, like silver nitrate, potassium bromide, and sodium thiosulphate are readily soluble in water; others, like mercuric chloride and calcium sulphate, are much less soluble; whilst others, like silver bromide and silver iodide, are not soluble at all. Some substances which dissolve readily in water will not dissolve in alcohol—*e.g.*, common salt, alum—whilst others are insoluble in water but soluble in alcohol—*e.g.*, many oils and other organic compounds.

The solubility of solids in water and other liquids is greater the higher the temperature. There are a few apparent exceptions to this law, but they need not be considered here.

EXPERIMENT 94.—To 100 grms. of cold water add 70 grms. of ammonium chloride, and agitate for some time; observe that the whole of the salt does not dissolve. Now gradually heat the mixture, continuing the agitation; observe that as the temperature rises, more and more of the salt dissolves, until it has entirely disappeared. Allow the liquid to cool: observe that as the temperature falls, the salt gradually separates again.

EXPERIMENT 95.—Perform a similar experiment with 100 grms. of water and 200 grms. of alum.

When a solution contains as much of a solid as it can contain at the particular temperature, it is said to be *saturated*. If the temperature falls, it will deposit some of the salt, because the solubility diminishes with the temperature; if the temperature is raised, the solution is no longer saturated, but will take up a further quantity of the salt. The influence of temperature on solubility is clearly shown by the following table, which gives the maximum quantities of the various salts dissolved by 100 parts of water at the temperature specified:—

		Common salt.	Potash alum.	Potassium nitrate.
0° C.	..	35.6	3.9	13.3
10°	..	35.7	9.5	21.1
20°	..	35.9	15.1	31.2
50°	..	36.7	44.1	86.0
100°	..	39.2	357.5	247.0

Notice how small the effect of temperature is in the case of common salt, and how large in the other cases.

If a saturated solution is kept quite still and out of contact with dust, and especially with solid particles of the same salt, it may in several cases be cooled down considerably without depositing any of its salt. It then contains a greater proportion of salt than it would contain under normal conditions, and is said to be *supersaturated*. Supersaturated solutions are in a very unstable condition, and agitation, contact with dust, and especially contact with a solid fragment of the particular salt, causes the excess of salt to separate, until the quantity left in solution is the quantity properly corresponding to the temperature of the solution.

When solid substance separates from solution they frequently assume a definite geometric form, or, in other words, they crystallise. Many salts when they separate from an aqueous solution combine with a definite proportion of water (see SALTS).

## Photographic Work for the Winter Months.

BY T. PERKINS, M.A.

### CHAPTER IV.

INDOOR WORK—PRINTING, LANTERN-SLIDE MAKING, ETC. The weak light and short days of winter render printing in silver a work of difficulty, but I believe that every year an increase in the number of those who have discarded albumenised paper for matt-surface paper of some kind may be noted. Gradually popular taste is being educated, and I trust that at no very distant period a glossy-surfaced photograph will be looked on much in the same way as a varnished engraving would be looked on now. Of course, there are methods of printing in silver which do not show the objectionable gloss, but when we consider the greater permanence of platinum and bromide prints, and the fact that now a variety of tones may be obtained in them, it seems to me desirable to use these processes in preference to any of the newly invented or re-introduced methods of matt-surface printing in silver. By means of bromide paper we may, as most photographers know, make good prints from many negatives that would not by any other process yield a print fit for any place but the waste-paper basket or the rubbish heap. Negatives wanting in contrast, with the shadows veiled in fog, may often be made to produce bright and vigorous prints. Artificial light is most suitable for contact bromide printing, and hydroquinone is probably the simplest developer to use. With this there is no necessity for a clearing acid bath, such as must be used when the erroneous oxalate developer is employed, but great care must be taken to use a new fixing bath, and to throw it away and take a fresh one as soon as the slightest discolouration in the solution is seen, otherwise the whites will lose their purity. This work is well suited for winter, and it is well to reserve the printing of such negatives as I have been describing to this time of year. But I should myself never print a negative on bromide paper that would give a good print in platinum. The platinum process is simpler, and though the time of exposure is longer, yet the time spent over development is much less, and the subsequent washing much less troublesome. We often hear it stated that negatives must be especially prepared for platinum printing, and we are led to ask, "What are the characteristics of a negative suited for this process?" Many would say the negatives must be exceedingly vigorous and dense, but I have made some of my best prints from very thin negatives, not flat ones, but negatives in which the deepest shadows were absolutely clear glass, and the skies so thin that when the negative is held an inch or two above a well-lit sheet of printed matter the words can be read through the film. To print such negatives, diffused daylight should be used, and not direct sunlight, but when the negative is denser I prefer to print in direct sunlight, as I believe a short exposure to a strong light has a greater effect than a longer exposure to a weaker light in bringing out the clouds in a picture—a point always to be aimed at, for no clouds can be so true to the lighting of the picture as those that were floating in the air at the time the negative was taken. Printing in clouds from "cloud negative" is an unsafe method at all times, and I cannot see how those who approve of this method can find fault with "combination printing," which has been so vigorously and almost unanimously condemned. One kind of cloud negative alone would I use, and that is one taken immediately before or after the other negative without moving the camera, but exposed and developed with special reference to the clouds. But this is a digression. Platinum

paper is so sensitive that on many winter days the light is sufficiently strong to print a large batch of prints in a day, using from half-a-dozen to a dozen printing frames. In mid-winter ten o'clock will be quite early enough to begin, and no prints should be started after two o'clock. The development should be done the same day, as soon after the printing is over as possible, and may conveniently be done by gas light. After having for a time abandoned the hot-bath process for the cold, I have returned to the original method as less expensive on the whole, a consideration, now that the price of platinum is so high, and as being less liable to defects. If a brown tone is desired, the special sepia paper may be used, or if only a few prints of a brown colour are wanted, they may be reserved to the last, and before they are developed a little of the bichloride of mercury solution ordinarily used for intensifying negatives may be added to the hot developer. I first noticed the effect of mercury in giving a brown tone to the prints from observing that prints from unvarnished negatives which had been intensified with mercury often turned out brown. If we want black prints from such negatives, it is well, especially in winter time, to well warm them before the fire just before printing, so that they may not, through being slightly damp, communicate any mercury to the paper.

The paper now supplied by the Platinotype Company will keep for some time; still, I generally do not open a tube until I have sufficient printing to do to use up the whole contents of the tube within a week or so. Oxalate of potassium is so cheap, that it is scarcely worth using the same solution for more than one or, at most, two batches, as the prints are always more brilliant when the solution has not been used before.

Lantern-slide making is most fascinating work, and a good lantern-slide when made is, or ought to be, a joy to all beholders. There is still, however, I find, among many persons, a prejudice against lantern exhibitions. They say magic-lantern shows are suitable for children, but one can hardly expect those who are grown up to go to such entertainments. This is due, I believe, to two things: first, the remembrance of what the magic-lantern was in their younger days; and, secondly, to the fact that even now so many slides shown at entertainments are coloured. A coloured slide is, in my eyes, an abomination; it much resembles, in its effect, a coloured engraving produced by putting washes of water-colour over a woodcut or line engraving printed in black or brown ink. We see such things occasionally, and most of us have produced such "works of art" in our younger days. It stands to reason that a coloured lantern-slide cannot be like nature; the black or brown of the photograph on the film must show through the transparent colours, which can alone be used for the slide, and destroy their purity. It is impossible, for instance, to give the correct colour to grass or foliage, hence the coloured picture, when projected on the screen, while pretending to be an accurate transcript of nature, is not at all natural. Far better is it to simply attempt to produce a picture in monochrome—black, or grey, or brown, according to one's fancy. Coloured slides often resemble the scenic effects produced by lime-light on the stage far more than they resemble nature. I think it well, then, that every amateur photographer who cares to advance the dignity of his art should do what he can to improve popular taste by refusing to exhibit any but uncoloured slides; and, moreover, to avoid reading the "illustrative readings" supplied with sets of slides, with their dry statistics and poor jokes, which make many lantern exhibitions in village schoolrooms and mechanics' institutes so wearisome. The subject should be well prepared beforehand, and the lecture delivered from notes, and not read from a printed book or from a fully written

out manuscript. The circulation of lantern-slides which have been sent in for the AMATEUR PHOTOGRAPHER competitions ought to do much to educate the public to a just appreciation of good work.

I do not intend to give any formulæ for the development of lantern-plates—many may be found in the directions supplied with them—nor to recommend any particular brand of plate. I have tried several different kinds, and as a rule have found them good, but in most varieties one occasionally comes across a plate scratched, or with a bubble in the glass, and I have once or twice found every plate in a box frill and blister, while other boxes by the same maker were entirely free from this evil. Possibly this mischief may have been caused by improper storing. Of the two methods of making transparencies, namely, contact printing and copying in the camera, I much prefer the latter, even when the negative is copied the same size, for any want of flatness in the negative or lantern-plate which would prevent perfect contact, and might cause loss of sharpness, is rendered harmless when a copying camera is used; and, moreover, there is always a danger of scratching a negative when putting the lantern-plate in contact with it, and even of breaking a negative by the unequal pressure of the back of the printing-frame. Griffiths' lantern-slide making camera is a most useful little piece of apparatus, and so cheap that it is well worth having several of them to take the different sized negatives which we are in the habit of making. These cameras are made either square or oblong. If one only can be afforded, an oblong one is decidedly the most useful; but if more than one is bought, a square one for a certain sized negative can be used as an oblong one for a smaller sized negative by simply fastening the negative in a corner and sliding the carrier into the grooves. There are several reasons for preferring oblong pictures to square or round ones for lantern-slides: first, round or square pictures are not pleasing; if they had been, we should not find painters always avoiding a square canvas, and so seldom using a round one. Again, most photographers, when taking their negatives, have an eye to printing paper positives as well as making lantern-slides from them, and any one who goes about his work judiciously will compose his picture well upon the ground-glass of the camera, and in most instances cutting off the ends of the picture, so as simply to take a square from the centre, will entirely spoil the balance.

I find that when using one of these cameras I can without any help expose and develop about a dozen plates in an hour. The way in which I economise time is as follows:—First I look out the negatives I wish to copy, open a window of a room into which the sun is not directly shining, make some arrangement by means of a chair or box for conveniently placing the slide-making camera in a sloping position, so that it may point to the open sky, then I take the camera into the dark-room, insert the negative at one end and the lantern-plate at the other, carry the whole affair to the open window, and expose for such time as I think will be sufficient (at the present time, at midday on a bright day, at a window with a south-eastern aspect, using a stop of  $f/22$ , I find one to three minutes sufficient exposure). I then take the camera back into the dark-room, remove the lantern-plate, place it in the developing dish on a rocker, and then insert another lantern-plate; by the time this has been done the picture should be coming up, and it can be seen whether the slide is likely to be satisfactory or not. If it promises well, I change the negative and take the camera out for another exposure, and while this is being made I return to the dark-room and finish off the former slide. If, however, an assistant can be found to take the camera, when loaded, from the dark-room to the

window and manage the exposure, so that one's uninterrupted attention can be devoted to the development, the chance of occasionally over-developing a plate is avoided. If a slide should be too thin it may be intensified, and of those intensifiers which I have tried, I have found that mercury followed by ammonia gives the best results; any intensifier which in any way tends to block up the transparent parts of the slides must be avoided. I have never yet succeeded in getting a good result by reducing a slide which has been over-developed, for in over-development the bright parts of the picture get fogged, and this fog will not be entirely removed by reduction. Good clouds in a slide add greatly to its charm, but the only satisfactory way that I know of producing them is by having them in the negative, and if necessary and possible, shading the foreground of the negative with a sheet of card during part of the exposure. Printing clouds on another plate and using this as a covering glass is possible, but this method labours under all the disadvantages of combination printing. When the slides are fixed, washed, and dried, it remains to put masks between them and the covering glasses, and to bind the two 'glasses together. Varnishing before binding is an additional protection to the pictures. As a rule, oblong-shaped masks are best; these show the whole picture. If it is desirable to take off rather more than the mask will hide, a piece of a binding strip may be used to reduce the size of the opening. Binding the transparency and the covering glass together is a very easy matter, or a most tiresome one, according to the character of the binding strip; some are very good, others are as bad, refusing to stick to the glass. None that I have used can beat those made in several different colours, and sold by Vevers, of Leeds. When the mask has been arranged, I can bind a slide with one of these strips without difficulty or hurrying, in the space of a minute. When all the slides are bound and the binding is dry, they should be held over a white sheet of paper and turned over, if necessary, so that the picture is seen with the right and left sides as they would be in nature; and two little white discs about an eighth of an inch in diameter should be stuck at the two upper corners. These can be easily seen in the dim light of the room in which the pictures will be exhibited, and if these are placed downwards and facing the condenser, the picture will be shown as it should appear on the screen. Many exhibitors fall into the mistake of attempting to enlarge the pictures on the screen to such an extent that there is not sufficient light to show them well; brilliancy is of far more importance than size—a large, dimly lit picture in which the details can hardly be seen, is anything but pleasing. The stronger the light used, the larger the projected pictures may be made; hence, when using an oil lantern it is well to confine the size of the illuminated circle to a diameter of four or five feet, while with a lime-light lantern a circle of twelve or fifteen feet, or even more, may sometimes be used with advantage. The best lantern slides are those made from negatives full of detail and sharp withal, for, owing to the increase of size when the picture is projected on the screen, broad patches of light or shade without any detail showing offend the eye, and, of course, with the increase of size sharpness is lost, so that if the slide is fuzzy the picture on the screen will be blurred to an unbearable extent.

There is one other form of photographic work well suited to the winter months, about which a very few words must be said—namely, enlarging. Enlargements may be made either by daylight or by artificial light. The former is by far the simpler process, and does not need the expensive apparatus which enlarging by artificial light requires. The best lens to use for this work is the achromatic triplet, made on Dallmeyer's principle, on account of the flatness of

its field. This can be fixed in a camera similar in character to that alluded to above for reducing; when making lantern slides, the lens should be placed so that the end of the tube which was nearest the sensitive plate when the original negative was taken is turned towards the negative to be copied. By inserting the negative in a groove at one end, and a sheet of bromide paper fixed in a carrier at the other, an enlargement may be made without difficulty. Unless some arrangement for focussing be made, the negative will, of course, be always enlarged to the same extent, but this will probably be enough for most purposes. The result of enlarging is to uniformly diffuse the focus if the negative from which the enlargement is made is uniformly sharp, and to keep the due gradations of sharpness by proportionately softening the whole if the negative has been taken according to the principles of differential focussing. One advantage that an enlargement has over a print from a large direct negative, is that the difficulty of getting the various parts of the picture into reasonable focus together, owing to the shallowness of focus of long-focussed lenses, is avoided.

I have now touched on most of the work that is especially suitable for winter time, and now that we are well advanced into the month of February it is time to close this series of articles, for after the long and severe winter, we are all looking forward to an early and warm spring, and are beginning to hope that at no very distant period the glades and hedgerows will be clothed with leaves and flowers, so that we shall be able to begin regular work again in the open air, and to go forth, day by day, in search of the subjects which are our special delight, whether we aim at producing artistic pictures, or are satisfied with the humbler but no less useful work of making scientific records by means of camera and lens.

## Photo-Micrography.—IV.

By ANDREW PRINGLE. *Bozapeath.*

### ILLUMINATION.

IN the matter of radiants for photo-micrography there is more room for choice on the scores of convenience and expense than for difference of opinion. There is but little doubt, as there is but little denial, that the best radiant for our work is the sun; sunlight is at once the most actinic and the most visually brilliant light we can get. Much of the best work ever produced has been obtained by means of direct sunlight. In the days when the wet collodion was the most rapid process available, it was found practically necessary in high power work to use direct sunlight—witness the wonderful productions of Dr. Woodward, U.S.A.; and even to-day, with rapid plates, such workers as Mr. T. Comber, Messrs. Fraenkel and Pfeiffer, Truan and de Witt, and others find that sunlight, directed by means of a heliostat, surpasses other illuminants. But in this country when can we depend on sunlight? I might almost say, when can we expect it? For myself, I should be at a standstill much more than half the year if I depended on the sun; and as few days pass without my having to produce some micrographic negative, I had at the outset to look for some radiant more at command than the sun. Diffused daylight I have found to be in many respects a very poor radiant indeed. I have, therefore, little or no knowledge of heliostats for our purpose, and shall merely refer my readers to

NOTE.—Mr. Pringle has kindly consented to answer any questions on photo-micrography. Letters should be addressed care of Editor.

the account of Mr. Comber's excellent heliostat, described and figured in the Journal of the Royal Microscopical Society for August of last year, 1890.

Failing sunlight, the light I should prefer would be the electric arc. This is a light of great power and actinic; it is always available where an electric installation exists, and the lamp is easily moved about. I have seen an *incandescent* electric light used with success by Dr. Van Heurck, of Antwerp; still, I am inclined to prefer the lime-light, which is more powerful, if rather less convenient, than the incandescent electric light.

A good oil-lamp is quite sufficient for ordinary purposes of photo-micrography, if the exposures necessary are not very long. It is well to have a powerful oil-lamp, one with a large wick, say one inch broad at least. Such lamps are sold by all opticians. The chimney may be round, but the part of it next the condenser should be flattened, and a metal chimney with a flat piece of glass, say 3 in.  $\times$  1 in., let into the front is the best kind I have seen. My own lamp was procured at Messrs. Swift's. The reservoir for oil should be large, and it should be of glass, so that the quantity of oil may be seen. If paraffin is used, a small lump of camphor may with advantage be added to the oil in the reservoir. I do not recommend round wicks (*i.e.*, cylindrical), still less do I advise the use of the otherwise excellent Welsbach burner. This gives a beautiful quality of light, but the constriction in the chimney, and the network of the "mantle" are hurtful to the image, even when a bull's-eye is used. It must not be forgotten that with the most powerful oil-lamp, for magnifications of 500 diameters or so, twenty minutes of exposure is not inordinate, ten minutes quite common. The mere duration of exposure is a trifle compared with the increased danger of tremor. I have, with a 1 inch-wick lamp, made many low-power negatives with an exposure of one minute, and even, at times, a few seconds; so that, if the reader proposes to confine himself to amplifications not over (say) 150 diameters, he may content himself with a good oil-lamp.

My favourite radiant, however, is the lime-light, and as many of my readers are probably already lanternists, this light may be the popular one. A blow-through jet answers fairly well, but it has the disadvantage of a large area of incandescence, and a tendency to redness of flame. Both of these are defects, the latter is particularly puzzling. I recommend a mixing jet, and in my experience it is better to have a specially small-bore nipple, that gas may not be wasted nor the eyesight hurt. Some good microscopists—many of the best, indeed—tone down the brilliance of a strong light with coloured glasses, chiefly blue. I have no doubt this is correct, but I cannot focus really accurately with a blue light, or I *think* I cannot; this is probably an idio-

accomplished by means of a "cut off" arrangement designed by myself some years ago as an addition to an ordinary mixing jet, and I figure it here (fig. 2).

There is on each tube, in front of the ordinary tap, a valve or tap having a toothed wheel operating it. The two are operated simultaneously and equally by a third toothed wheel operated by the cross-piece or T-piece seen at back of the jet. The oxygen is a complete cut-off, the hydrogen has a small bye-pass. In practice both of these supernumerary taps are turned full on, the gas lighted in the usual way and burning at its best; when the cross piece is turned slightly, the light is lowered without loss of quality; when the cross-piece is turned as far as it will go, the O. is entirely cut off, while the H. burns a small flame sufficient to keep the lime hot and to obviate necessity for relighting every time after the light has not been required. This is made by Messrs. Newton, and to me has saved its cost many times over. When I go to develop I turn down the cut-off; for the next exposure I simply turn it up again. Other arrangements with similar intention are made, but I have no experience of them, except one by Mr. C. Baker, which acts well.

I use oxygen from a cylinder with Beard's regulator, and hydrogen from the house main; this arrangement of itself

FIG. 3a.

R=Radiant. O=Object.

FIG. 3b.

CONVERGING BEAM.

FIG. 3c.

FIG. 3d.

FIG. 3e.

FIG. 3f.

necessitates a specially small nipple, and I see no element of danger in it, nor have had any hitch in its management. I use the hardest limes I can procure; "Excelsiors" I do not like for this purpose at all. A good hard Nottingham lime often lasts me a week; any other lasts but one day, if so long.

The illuminant, of whatever kind, should have a certain amount of motion, to and fro and sideways, but should be clamped strongly down once the central position is found.

The bull's-eye may be counted part of the illuminating system, and requires description here. A bull's-eye may be used as a condenser up to an angle of about 25 deg., and so may be used for work up to such as is done with an ordinary 1 inch O.G. But for various reasons it is, in this character, only moderately good. The real use of a bull's-eye is to collect and parallelise the rays from the radiant. In order to secure this, the light-point must be in a certain focus of the bull's-eye. The above figures will explain this,

FIG. 2.

synerasy. In adjusting the correction of an objective, or in critically examining an object, I do not consider it advisable to modify the glare by shutting down too much the condenser-aperture, so I use an arrangement by which I focus with a moderate light, and thereafter turn up my lime-light to the desired extent—*i.e.*, to its full. This is easily

Fig. 3a shows the radiant in such a position that the rays are parallelised by the bull's-eye. This is the proper way when a condenser is used. Figure 3b shows a bull's-eye used as a condenser (O is the object to be illuminated).

To discover easily whether the radiant is in the focus (for parallel rays) of the bull's-eye, project the rays that have passed through the bull's-eye on to a piece of card by means of any condensing lens of low power—e.g., the field glass of a 2 inch ocular. If the light is too near the bull's-eye the image will be as fig. 3c; if too far away, as fig. 3d; if the flame is in focus but not central, the image may be as at fig. 3e. Fig. 3f shows the appearance when the bull's-eye is focussed for parallel rays and centered. These figures are copied from a paper by Mr. E. M. Nelson in the *English Mechanic* of 1885.

I strongly recommend that an iris diaphragm be fitted to the bull's-eye for centering and regulating purposes. I use a double combination bull's-eye, in the form of a Herschel condenser, i.e., a meniscus and a double convex in close proximity to each other. This is not strictly achromatic, but better in this respect than the ordinary plano convex bull's eye.

## Chloride of Magnesium

IN THE

### COMBINED TONING AND FIXING BATH.

By E. J. WALL.

It is now generally known that Herr Liesegang was the first to suggest the application of chloride of magnesium as a fixing agent, and Dr. A. Miethe, the editor of the *Photographisches Wochenblatt*, in experimenting with this, suggested the following as the composition of the bath:—

Chloride of magnesium ..	15 grammes.
Alum .. .. .	2 "
Water .. .. .	100 c.cm.

On page 34 of the *AMATEUR PHOTOGRAPHER*, January 9th, a query appears about this, which elicited a somewhat unsatisfactory reply; I therefore began a few experiments with this salt, the results of which may lead others to experiment in the same direction.

Magnesium chloride has the formula  $MgCl_2 = 95$ , and is met with commercially as a crystalline salt, very similar in appearance to the well-known household remedy, Epsom salts, when slightly damped. It has an intensely bitter taste, is extremely deliquescent, and very soluble in cold water, 1 in 1.85, and also in alcohol. It is an important constituent of sea salt, or may be prepared by neutralising pure hydrochloric acid with magnesia or carbonate of magnesia. It would be advisable to obtain it from a chemist or dealer, as it is a well-known commercial salt, and is used for dressing cotton goods and for fixing aniline colours, and should not cost more than 3s. per lb.

EXPT. No. 1.—A fixing bath was made up of the above strength, and pure dry chloride of silver added till the liquid became permanently cloudy from the suspended particles of undissolved chloride of silver, when it was found that the above bath had dissolved 0.025 grammes of pure anhydrous chloride of silver. Further experiments were made with freshly precipitated chloride of silver, well washed till the washings showed no trace of nitrate, and as the mean of six experiments the solvent power of the above bath is about 0.01–0.02 grammes per 100 ccm. As is the case with common salt and other chlorides, the more saturated the solution the more chloride would be dissolved. Unfortu-

nately, I have not yet had time to carry my experiments any further, but certainly the solvent power of magnesium chloride is inferior to that of sulphite of sodium as proposed by Abney, and this is also much inferior to the ordinary hyposulphite bath.

Practical experiments were then carried out to show how far this new fixing salt could replace hypo in the combined toning and fixing bath for gelatino-chloride prints.

EXPT. No. 2.—The first bath tried was one suggested by Mr. Tylar as follows:—

ORIGINAL.		NEW FORMULA.	
Chloride of gold ...	4 gram.	... pure	4 gram.
Tungstate of soda ...	4 "	... "	4 "
Ammonium sulpho-			
cyanide ...	6 "	... "	6 "
Hyposulphite of soda	60 "	Magnesium chloride	60 "
Distilled water, to			
make ...	200 c.cm.	... to make	300 c.cm.

The salts were dissolved by the aid of a gentle heat, the chloride of gold, which was home-made and kept in the form of an acid stock solution, was rendered distinctly alkaline by the addition of bicarbonate of soda, and then added to the solution of salts, and the liquid made up to the required bulk. The prints were placed in this bath unwashed, and the bath gently rocked; the first sign of any action was a conversion of the purple tone of the print into a pleasing brown, and at the same time the print became more translucent, almost as though wetted with weak spirit, then the brown gradually changed into purple and purple-blue, and at the end of five minutes the prints were removed, drained, pressed gently between blotting paper, and placed in a dish of clean water; toning, however, still continued slightly. Six changes of water were given in half an hour, and the prints then hung up to dry. The temperature of the bath was 44° F. Its action was decidedly too rapid to control with any number of prints; the gelatine was rather soft, but not more so than with the original formula. The final tone of the prints is blackish-violet, with an intense pink ground, and the effect anything but pleasing.

EXPT. No. 3.—The next bath tried was that recommended by Liesegang:—

ORIGINAL.		NEW.	
Hyposulphite of soda	200 gram.	Magnesium chloride	200 gram.
Ammonium sulpho-			
cyanide ...	25 "	... "	25 "
Sodium acetate ...	37 "	... "	37 "
Saturated solution of			
alum ...	50 c.cm.	omitted	
Distilled water ...	800 "	... 800 c.cm.	
Add—		Add immediately—	
Silver nitrate ...	2 gram.	Chloride of gold...	1 gram.
Sodium chloride ...	2 "	Ammonium chlo-	
Water ...	3 c.cm.	ride ...	2 gram.
Leave for twenty-four hours, and		Distilled water ...	200 c.cm.
add—		The gold solution was rendered	
Chloride of gold...	1 gram.	distinctly alkaline by bicar-	
Ammonium chlo-		bonate of soda.	
ride ...	2 "		
Distilled water ...	200 c.cm.		

The prints were placed in this new bath unwashed, and in 75 seconds they had assumed a sepia-brown colour, which gradually turned in eight minutes to a rich purple—the prints were then drained, washed once, and hung up to dry. The final tones are the same as in No. 2 Expt.

The addition of 50 c.cm. of saturated solution of alum to the new bath caused strong effervescence and the separation of a curdy precipitate. When this was filtered out and the bath used, the prints placed in it turned slowly to the characteristic yellow colour assumed by all chloride prints when immersed in these toning and fixing baths, and the print ran the ordinary gamut of colour, from yellow to brown and purple.

EXPT. No. 5.—The next bath tried was that recommended by Liesegang, in "Anthony's International Bulletin for 1889":—

ORIGINAL.		NEW.	
Sol. A.		Sol. A.	
Chloride of gold	1 gram.	...	1 gram.
Distilled water	100 c.cm.	...	100 c.cm.
Sol. B.		Sol. B.	
Ammonium sulpho-			
cyanide	4 gram.	...	4 gram.
Common salt	16 "	...	16 "
Alum	8 "	omitted	
Hyposulphite of soda	60 "	Magnesium chloride	60 "
Distilled water	400 c.cm.	...	400 c.cm.
Allow to stand eight days, and filter.		Not allowed to stand.	

#### THE TONING BATH.

Sol. A.	...	...	...	...	7 c.cm.
Sol. B.	...	...	...	...	60 "

The original directions also state, "Add 40 c.cm. of old used combined toning and fixing bath." The prints were placed in this bath at once, unwashed, and again toned to a rich purplish-black, and were then treated as described above with six changes of water. The papers used in the above experiments were Liesegang's, Obernetter's, Talbot's, "Beta," and "Delta," and Celerotype, and with all very fine purplish tones were obtained, and in no case were brown tones possibly reached, except when using alum in the baths, though perhaps the use of much weaker solutions might effect this. The variation in tones was slight; certainly it could not be stated that any of the above baths gave one particular tone, and all the papers required about the same time to tone.

EXPT. No. 6.—The following experiments were then made to see whether any sensitive silver salt was still in the prints. Half of each print was covered with black paper, and then a thickness of red, and then a thickness of yellow, and exposed during a whole day to the light. Some prints were also made on similar but unused paper, to see whether the light was sufficiently strong to affect the paper, and three well printed out copies were obtained from one negative. The following results were obtained on the toned prints. Those parts of the prints exposed to light were considerably darker than the covered parts, and this was particularly noticeable with the prints toned in Expts. Nos. 2 and 5, and there is not the slightest doubt that the darkening was due to chloride of silver left in the film.

The action of washing the prints prior to toning was tried, and, as expected, with better results, as the free silver nitrate was thoroughly removed, and there was left merely the chloride of silver unaffected by light, for removal by the chloride of magnesium.

The deductions which, I think, are to be drawn from these experiments are, first, that replacing hypo in the combined toning and fixing bath with magnesium chloride is by no means satisfactory; secondly, inferior tones are obtained with the new baths, as made above; thirdly, the baths must be much weaker in gold and stronger in magnesium chloride before the prints may be assumed to be permanent.

If I might, I would suggest as a field for experiment to anyone taking up this subject the modification of the above formula in the direction stated, viz., reduction of the gold and increase of the new fixing salt, and also the application of a fixing bath of magnesium chloride before or after toning.

The temperature and concentration of the solution of magnesium chloride have an enormous influence on the solvent power, as 5 grammes of freshly precipitated chloride of silver are entirely dissolved by a boiling saturated solution of 300 grammes of magnesium chloride, and on cooling or dilution with water, the greatest part of the dissolved

salt is again precipitated. This was no more than I expected, as it is a fact which has been previously noted by many observers in the early days of photography. I must finally confess that till more extended and accurate experiments are made, the use of magnesium chloride as a fixing agent is, in my opinion, a retrograde step, though possibly, in the face of new facts and formulæ, this opinion may need modification. Magnesium chloride might be of service for fixing so-called matt-surface paper. I may perhaps be allowed to call attention to a paragraph in the "Dictionary of Photography," first edition, p. 70, under "Fixing:" "The author, in conjunction with an amateur photographer, has been engaged for some time in experiments as to a new fixing salt, and although these are not complete, fair hope is given that at no distant date a new fixing agent will take the place of hypo, equally as efficacious and yet much more amenable to reason." This salt which we were then trying was a chloride—but not magnesium—but further experiments proved that the temperature and strength of the solution had such enormous influences on the solvent power as to render it useless for practical work, because, like magnesium chloride, a solution of certain strength, say, for instance, 15 or 20 per cent. solution, would dissolve chloride of silver easily, but, on washing the print, which would necessarily entail a dilution of the solution in the film, some chloride of silver was precipitated, and the experiments were abandoned as useless.

Two statements which have been made about the new fixing bath now remain to be considered. The first is that there is no loss of tone; the second that the prints do not require washing afterwards. Two pieces of gelatino-chloride emulsion paper from a fresh packet were placed in the fixing-bath, and kept in motion for half an hour, then hung up to dry. As I now write, these pieces of paper are still hanging on the line, and in three days, or seventy-two hours, the gelatine film is yet sufficiently tacky to stick closely to the fingers when the same are pressed on them. This disposes of the second claim, and in the face of the fact that magnesium chloride is a deliquescent salt, I fail to see how this can be substantiated. The first, as to no loss of tone, I admit, but the tones obtained, as I have already said, are inferior to those with the usual baths.

#### HUNTER'S "LITTLE GIANT" ROCKER.

THIS clockwork rocker, which will run for half an hour with one winding, is made on an entirely new principle. Instead of the usual see-saw motion, the dish is, so to speak,

oscillated in a horizontal position. The advantage of this new movement over the older one is that the developer receives not only a wave motion, but a circulatory one, and practically no portion of the fluid comes on the same part of the plate twice in succession. The box of the rocker occupies

7 in. by 5 in., but it will carry a dish, if light, up to 15 in. by 12 in. The speed of the motion can be easily regulated by the position in which the dish is placed. The price is only 13s. 6d.

Mr. Hunter also showed us a new serrated Vignetting Screen in black cardboard, which is of very convenient form, and sold in shilling packets of quarter, half, and whole plate. Their "Duplex" Roller Squeegee is a good idea. It consists of two indiarubber rollers, mounted parallel, and both acting on the print at the same time, so that a firm, steady pressure can be given without the usual tendency to drive the print off at an angle.

## Our Contemporaries.

*Anthony's Photographic Bulletin* gives the following:—"A combined developer of pyro and hydroquinone is recommended by Dr. C. Schleussner, of Germany, made as follows, which is said to give fine results:

SOLUTION A.				
Hydroquinone	..	..	..	20 grams.
Distilled water	..	..	..	2000 c.c.
SOLUTION B.				
Carbonate of potassium	..	..	..	100 grams.
Distilled water	..	..	..	500 c.c.
SOLUTION C.				
Distilled water	..	..	..	400 c.c.
Sodium sulphite	..	..	..	60 grams.
Diluted sulphuric acid	..	..	..	10 to 20 drops.
Pyrogallol	..	..	..	20 grams.

For use, combine 40 parts of solution A with 10 parts each of solutions B and C, starting development with an old mixture, replacing it by fresh, as development proceeds."

The *American Journal of Photography*, says, "Captain Pizzighelli gives the following formula of a developer for transparencies: A, Dissolve 39 grammes of citric acid in 135 c.c. of water, and neutralize with aqueous ammonia. Should too much ammonia be used, it must be removed with the aid of heat. Then add 26 grammes of citric acid, and the solution is diluted so as to make 270 c.c. B, Solution of ferrous sulphate, 1.3, slightly acidified with sulphuric acid to prevent its oxidation. C, Solution of chloride of sodium, 1.30. To develop, take A, 10 parts; B, 5 parts; C, 1 part. Chloride of sodium is a powerful restrainer, and should be used with care. Sulphate of iron in a larger proportion than that indicated retards development. By diluting the developer we obtain prints that are soft and of less intensity. Gallic acid as an accelerator. It produces sepia tones. To the above solution we may add two and a half parts of a solution of gallic acid at one per cent. By this process we are certain to produce excellent transparencies."

*Wilson's Photographic Magazine* says, "But patient and persevering as one must be to get together the materials for a picture, the ability to use them properly is vastly more important. Hammerton says art is selection; and this is especially true of those who work by means of photography. To know what to select and what to avoid, is the beginning of wisdom in the making of a picture. A knowledge of art principles, and a feeling for art values, must be and abide with us, or we strive to compose in vain. And yet, while we seek for breadth of light and shade, to have all accessory effects in a minor key, and to properly emphasize the focal interest of the picture, a too strict observance of rule betrays itself, and contributes to a stiff and unsatisfactory result. It has the same air as a person who is unaccustomed to the usages of society, and is trying to lay his course by a book of etiquette carried in the pocket. But one must first have a familiar acquaintance with rules of art before he can intelligently and gracefully disregard them, even to that slight degree which is sometimes an advantage. The nature of the subject must frequently lead to the modifying of exact rules."

The *St. Louis and Canadian Photographer* quotes the following:—"A discovery has recently been made which promises to revolutionise the process of etching, especially in photogravure. The drawing is traced, as usual, on a plate of zinc, either by an artist or by photography, with any suitable ground. This plate, backed with asphaltum, is laid in a bath of dilute acid. It is then put in circuit with a dynamo, the other pole being merely placed in the acid. When the current is allowed to pass, the acid attacks the metal with great rapidity, and a few minutes will suffice to bite the plate, and the depth of the etching can be regulated with mathematical accuracy, while after the old fashion, the surface becomes covered with the film of hydrogen or with a number of minute bubbles, which prevent an effect unless the plate be incessantly rocked or brushed. The discoverer, whose name is withheld, reasons that in the electric etching the action of the acid is due to a depolarisation of the metal surface."

The *Photographic Herald and Sportsman* gives the following hints on "Burnishing":—"Never allow the mounted prints to become bone-dry. Keep them between blotting paper till bur-

nishing time arrives. This plan has the following advantages: The mountant will sufficiently dry, and at the same time the mount will retain the moisture necessary to make it pliable under pressure, the print itself will be thoroughly protected from dust and grit, which might otherwise be ground into it. The lubricant in general use is white Castile soap, which is applied by rubbing the cake of soap with a tuft of cotton or flannel, and then rubbing the face of print a couple of times with the soaped material. This is the dry method. Some burnishers prefer dissolving the soap in alcohol (three or four grains to one ounce of alcohol), which is applied in the same manner, but takes a few minutes to dry, whilst with the dry soap you can run a print through immediately. Inspect and clean your burnisher before applying heat. See that the polished surface is free from scratches, and if not, proceed with fine emery paper to eradicate same, always rubbing back and forth, with the length of the burnisher, as the scratches run across, or at right angles to the length, and are due generally to grit picked up by the damp print and carried through with it. Heat your burnisher thoroughly at the start, and remove the water which collects on the roller, the same being due to condensation from the atmosphere. It is a capital plan to run an old or rejected print through to test the burnisher when you have it thoroughly heated, and note the result. If with a good pressure there is a lack of polish, the burnisher is not hot enough. If the print scorches, it is too hot, reduce the heat. When you procure the results you require, keep the heat steady. In running prints through, it is advisable to run them from one side only, and not back and forth, and in burnishing, say, a five by eight print, run it through the narrow way first, giving it as it goes through a bend backwards from the print, then bring it over the burnisher and run it through again the narrow way, but this time run the opposite end through first, and bend as before. Now run it through twice the broad way, but do not put but a slight curl on it; and you have, if everything works all right, a nicely burnished print. In burnishing, always give the curl that is the final bend in the direction of the longest side of the mount."

*Engineering* recently published an article on the steamer *Puritan*, which is to run on the Fall River line, illustrated by nine fine process-block reproductions of magnificent views of the interior of the vessel.

## Notes from Paris.

At the last meeting of the Academie des Sciences two novelties, both connected with photography, were exhibited. One of these was a new camera for instantaneous photographs. It was claimed by the inventor that the machine could take fifty photographs a second. In proof of this assertion he exhibited a series of pictures showing two men fencing. In one case one of the combatants had been disarmed, and before the foil touched the ground the camera had taken no less than eight pictures of it.

At the same meeting, M. Lippmann, who has been engaged for some years past on experiments on "nature-coloured" photographs, showed several pictures of the spectrum of light. In most of these the seven colours were clearly defined and well coloured. The details of the process were not made known, but were reserved for another occasion, when the inventor also promised to exhibit some photographs of stained-glass windows.

Another new form of hand-camera is called the "Photo-Album." In outward appearance it closely resembles—as its name would imply—a photograph album bound in leather, and closed with a wire loop. When this is undone and the book opened, it forms a triangular-shaped dark chamber. The objective is placed in the centre of the back of the book, and this back is made movable to allow of focussing. The Photo-Album weighs 19 oz. It measures, when closed, 7 by 5 by 1½ in. in thickness, and can be conveniently slipped into the pocket of a great coat. It can be made ready for use in a few seconds. The price is £5.

The Photographer's Compass, the invention of M de Coudon, is a very handy little instrument, likely to be very useful to amateurs on photographic excursions. It is a small compass, so small, indeed, that it can be worn as a charm on the watch chain. Half of the face is covered by a fixed plate. Only the four cardinal points are marked on the card, the intermediate spaces being marked with lines and figures denoting the hour of the day. A photographer, who wishes to know the most suitable

## Exhibitions.

### DUDLEY GALLERY ART SOCIETY.

A PARTICULARLY cheerful exhibition of water-colour paintings by the artists who form the Dudley Gallery Art Society are now on view at the Egyptian Hall. The reference by a prominent politician to the pleasures of his "ain fire-side" finds apt interpretation in Mrs. R. Hussey Freke's "When Life is O'er" (8). The drawings by Miss E. E. Dell all manifest delicacy; particularly is this evident in a picture to which a quotation from Keats is attached (14). We do not recollect having seen the sea with such a hue as that depicted by Mr. A. Webb in "A Breezy Day" (15). Mr. W. R. Stevens must be congratulated on the Turner-esque effect in "On the Scheldt" (23). The view "Near Eaton Hall" (39) is well chosen. Mr. Donne is very accurate in depicting the "Snow and Mist on the Slopes of the Jungfrau" (47). In Mr. R. A. K. Marshall's "Evening on the Usk" (53) there is a charming atmosphere which deserves high praise. In "Craft Entering Port" (67), Mr. F. J. Aldridge exhibits much ability. Mr. A. Stevens is fortunate in the "Waterlily Pool" (72), which, however, appears to us to be rather flat in its treatment. "All in a Garden Fair" (77), by Mr. F. Coleridge, who sends twelve pictures, is very happy. Miss Helen O'Hara must be congratulated on her skill as shown in "The Golden Evening Brightness of the West" (94). Miss Manby's "Rebekah" (99) is successful. In "Clouds and Sunshine" (108), Mr. W. J. Ferguson shows excellent perception of the difficulties of landscape. Miss Manby is very happy in "Sweet Seventeen" (132). This "Child's Faec" (148), by Mr. E. Taylor, is beautifully drawn. This gentleman succeeds, also, in "A Penny for your Thoughts" (194). The President of the Society, Mr. Walter Severn, shows all his well-known artistic ability in a view of Lake Como (154). The sunshine effect which Mr. Coleridge has infused into "Streatley-on-Thames" (166) adds greatly to the beauty of the picture. "A Mild Winter's Day" (185), by Mr. W. R. Stevens, would win the commendation of photographers who favour impressionism. Other examples for them may be found in Mrs. Heathcote's "Sunset and Evening Star" (288), and Mr. R. Jones's "Faversham Fog" (307). Mr. Goddard gives a capital view of the "Junction of the Bure and the Yare" (197), and Mr. E. W. Cook's "Loch Achray" (203) is admirable. The fleecy clouds which Mr. G. S. Walters depicts in "Summer Evening, Holland" (253), shows much felicity of treatment. Mr. Severn's "Loch Fyne Fishing Boats" (320) deserves high praise. The exhibition, which includes the work of eighty-seven artists, is interesting, and is well worth a visit.

## Societies' Meetings.

**Brechin.**—The ordinary monthly meeting was held on the 3rd inst., Bailie Lawrence, Vice-president, in the chair. After some preliminary business, Mr. George Mackie, one of the Vice-presidents, gave a practical demonstration of "Making Lantern Slides by the Wet Collodion Process." A slide was made by contact, after being allowed to get surface dry, and a mat placed between it and the negative. Thereafter another slide was made by reduction from a  $\frac{1}{2}$ -pl. negative. The contact slide was exposed to a gas flame, but magnesium was used for the reduced one. Both were very successful. Fifty slides, sent for exchange by the Paisley Society, were then exhibited by means of the lantern.

**Cardiff.**—At a meeting on the 6th inst., Mr. John Storrie, the Curator of the Cardiff Museum, gave a practical demonstration on "Microscopical Photography." The lecture was of peculiar interest to those interested in geology; it being shown how the difference in the value of light when polarised enables clearer photos to be obtained than under ordinary light, of crystalline objects. Examples of this scientific branch of photography, dating back to 1851, were passed round for inspection. These examples were the earliest productions of any real value. In response to a vote of thanks, Mr. Storrie intimated that on the 13th March he would give a lecture on "Insect Life," or photo-micros illustrated with the lantern.

**Cambridge.**—A meeting was held on the 2nd inst. Matters of photographic interest were discussed, and arrangements to hold a "practical enlarging" class were proposed for the next meeting.

**Croydon.**—An ordinary meeting of the Microscopical and Natural History Club (Photographic Section) was held on the 6th inst., Mr. John Weir-Brown in the chair. Mr. J. Howson gave a very interesting demonstration on "Bromide and Alpha-Papers." Several members took part in a discussion which followed. This is the first

demonstration of the kind that has been given in their newly-acquired dark-room, and the crowded and appreciative audience tended to show that it was a decided success.

**Ealing.**—The meeting was held on the 5th inst., when the chair was taken by the President (Mr. H. W. Peal). The President announced the gift to the Society of a cabinet for storing their books, etc.; he also presented several books. Mr. W. E. Wright showed some very fine negatives taken on films and developed with eikonogen, six grains to the ounce. Mr. Whiting exhibited three shutters, both for time and instantaneous exposures, of his own manufacture, and also a broken negative, with a print from it after it had been repaired, the print not having the least trace of any defect. Dr. Clifford Gibbons showed a developing dish which he used for films, and entirely prevented them cockling. Mr. Winter, from Messrs. Mawson and Swan, exhibited two camera stands, and also a hand-camera made in Holland, which he explained to the members. The President showed a new stand for supporting flash lamps so as to reduce the trouble in placing them. The next meeting of the Society will be on the 19th inst., when the AMATEUR PHOTOGRAPHER prize slides, 1890, will be exhibited by the optical lantern.

**Haltwhistle.**—The annual meeting was held on the 2nd inst., Dr. Speirs in the chair. The Treasurer's account for expenditure during the year 1890 having been read, it was resolved that the amount be apportioned equally among the members. The office-bearers elected for the current year are—Mr. Edward Joicey, Blenkinsopp Hall, President; Dr. Speirs, Vice-president; and Mr. David Macadam, Honorary Secretary (who also acts as Treasurer). The rules were gone through and altered, and ordered to be printed. The subscriptions for the year were fixed as follows: Ordinary members, 5s.; honorary members, gentlemen, 7s. 6d., ladies, 5s., double ticket, 10s. 6d. Five honorary members were proposed and accepted. After the business was completed, honorary members and friends joined the meeting to inspect an exhibition of photographs entitled "Inland Scenery," lent by the Editor of the AMATEUR PHOTOGRAPHER. The prints were tastefully arranged round the room, and afforded a great deal of pleasure.

**Huddersfield.**—A special meeting was held on the 4th inst., when the stereoscopic prize slides, kindly lent by the Editor of the AMATEUR PHOTOGRAPHER, were placed before the members, and greatly admired. The set which took the second prize were very fine, the opinion generally expressed at the meeting being that if they had been transparencies they would have been perfection.

**Leeds.**—At a meeting on the 5th inst., the President, Mr. Godfrey Bingley, in the chair, Mr. C. H. Bothamley, F.I.C., F.C.S., delivered a lecture, entitled "A Good and Bad Photograph." In introducing the subject, Mr. Bothamley referred to the absolute necessity for every photographer making himself acquainted with the leading rules of art, and in a very clear and interesting manner Mr. Bothamley pointed out the necessity of the rules of composition and light and shade, illustrating his remarks by diagrams on the black board and a large number of clever lantern slides. At the close of the lecture a vote of thanks to Mr. T. W. Thornton, the retiring President, was heartily accorded.

**Lewisham High Road.**—An ordinary meeting was held on the 4th inst., Mr. Alfred H. Miles in the chair. The Secretary read a paper on "Toning and Printing," showing several chemical experiments, and demonstrating the use of the salt toning bath.

**Leyburn.**—At the meeting of the Leyburn Literary and Scientific Society, on the 6th inst., the Hon. J. C. Dundas in the chair, a paper on "Instantaneous Photography" was read by the Rev. A. Kelly, with lantern illustrations. The lantern was worked by the Rev. F. W. Stow, Vicar of Aysgarth, an AMATEUR PHOTOGRAPHER medallist, and the slides exhibited were by the Rev. F. W. Stow, Rev. A. Kelly, Mr. H. Knight, of Middleham, and Mr. B. Smithson.

**Newcastle-on-Tyne.**—On the 6th inst the AMATEUR PHOTOGRAPHER 1890 Prize Competition Slides were exhibited in the lecture hall of the Literary and Philosophical Institute before a large and appreciative audience, numbering about 700. Mr. J. P. Gibson occupied the chair and described the slides, whilst the lantern was under the experienced management of Mr. Ridgway, who, using the ether saturator, got as usual a brilliant light. The slides gave great satisfaction to the large audience, the sets by Messrs. Gratschieff, Austin, and Wade coming in for most admiration, the first-named in particular being warmly applauded.

**North Middlesex.**—The last meeting was held on the 9th inst. Mr. Walker (in the chair) said the subject for the evening was "The Best Treatment of Winter and Snow Scenes." He thought that views in which there were no heavy objects in the foreground were best, and a developer weak in the reducing agent most suitable. Messrs. Mummery, Norris, Beadle, Gill, Goodlew, and the Secretary passed negatives and prints round for inspection and gave their methods of working. Mr. Norris had given 15 to 20 secs. with large stop, and developed with full strength pyro and ammonia. Mr. Beadle had given 15 sec. with  $\frac{1}{32}$  on a hoar-frost view, and developed with pyro Ilford formula used full strength.

Mr. Gill showed some instantaneous pictures of figures in snow scenes taken at 8.30 a.m. in December. Referring to the widely-different exposures, Mr. Cox had seen negatives taken under similar conditions, but with exposures varying from four seconds to five minutes, yield equal results in the hands of an experienced developer. Mr. Goodhew recommended, in cases of great contrast, as in snow scenes, that the plate should be flooded with the ammonia and bromide, and the pyro added by drops till the image appeared. The Secretary had used eikonogen and ammonia with meta-bisulphite, as suggested by Mr. Secretan. Mr. Pither had failed to get density with the weak pyro method. Mr. Gill showed two hand-cameras of his own invention.

**North London.**—At the meeting on the 3rd inst., Rev. E. Healy in the chair, Mr. Bishop showed a specimen of excellent varnish which he had prepared, suitable either for negatives or positives. It consisted of amber dissolved in chloroform. Mr. Coventon asked whether, in making bromide prints, it was better to have a bright light and keep the negative at a distance suitable to its density, or to use a smaller and less powerful light according to the negative. The Chairman said that doubtless it was best to use a standard light for everything, and remove the negative, if necessary, to a greater distance. Mr. Tanner said that he covered the negative with tissue paper when necessary, and removed it to a suitable distance. Mr. George A. Powell asked whether the commercial ferrotype dry plates were sensitive enough to get good results from flash-light exposures, and whether the usual oxy-hydrogen lime-light would be powerful enough for these plates, and whether there would be any difference between the exposure of these dry plates and, say, Ilford ordinary. Mr. Hart said that the lime-light, as commonly used, was no good, and Mr. Powell would find that he could take excellent wet collodion positives on glass by flash-light exposure. Mr. Coventon asked what was the best plan for preventing halation without backing the plates with any substance, which was troublesome to clean off again before developing. Mr. Tanner said that he backed his plates with red paper smeared with glycerine, as this was easily removable by slight soaking. Mr. Grover had found that Thomas's thick-coated plates answered well without backing. Mr. Oakley said that he could generally remove most of the halation by rubbing down with a piece of soft cork dipped in methylated spirit; he did not believe there was any specific against halation, which, in his opinion, was due to local over-exposure.

**Richmond.**—This Society, whose numbers are steadily increasing, has now started weekly meetings (instead of fortnightly as hitherto) at the Greyhound Hotel, a more central and convenient location than their former quarters. The first meeting under the new arrangement took place on the 6th inst., a lantern night, when slides by Messrs. Hunter, Faulkner, Richardson, Ardaseer, and Cembrano were shown and discussed; those of the last-named gentleman, a series of views in Chester and North Wales taken during last year's Photographic Convention, being specially admired for their technical and artistic excellence. On Monday the 16th, Major J. Fortuné Nott, President of the Society, will give a lecture with lantern illustrations on "Wild Animals in Captivity," at 8 p.m., in the lecture hall, Hill Street.

**Sheffield.**—The annual meeting of this Camera Club was held on the 28th ult. The report of the Secretary on the working of the Club during the past year was exceedingly satisfactory. The following were elected as officers for the ensuing year: President, Mr. G. T. Newsholme, F.C.S.; Vice Presidents, Dr. T. H. Morton and Mr. H. J. Rawson; Hon. Secretary, Mr. G. E. Maleham; Treasurer, Mr. B. W. Wirider; Council, Prof. J. O. Arnold, F.C.S., Drs. J. A. Munton and E. Skinner, Messrs. Wm. Gilley, junr., A. Copley, and P. Slater.

**Sheffield.**—The ordinary monthly meeting of the Photographic Society was held on the 3rd inst., Mr. B. J. Taylor in the chair; when, after the election of new members, a lantern exhibition was given.

**Stockton.**—The Society is increasing in numbers and importance. So much so, that, instead of meeting periodically in the Lit. and Phil. Hall in the Exchange, the old Masonic Room in Masons' Court has been secured for the general use of the Society and its members. A dark-room has been fitted up, and every facility is afforded to those who desire to acquire proficiency in this delightful art. The members and friends had a pleasant reunion in the Freemasons' Hall on Tuesday the 3rd inst. Between 200 and 300 photographs taken by the members were on view, as were also a number of stereoscopic slides, the work of Dr. Stainthorpe, Mr. Ellam, and Councillor Graham. During the evening, Mr. Moulthrew a number of lantern slides—chiefly rural scenery and rural objects taken by the members—on to a large screen. The evening was diversified with a programme of very agreeable music by Mr. Woolman's band. A very interesting programme has been arranged for the season, which consists of monthly photographic competitions, excursions twice a month; and at the end of the season nine medals are offered for competition (amongst members only) by the Council. Mr. Ellam of Yarm, the Secretary, has also kindly promised to assist any beginners joining the Society.

**South London.**—At the meeting on the 6th inst. there was a demonstration on "Enlarging" by Mr. S. Wiles, using bromide paper prepared by himself. In the opinion of the members, the paper was fully equal to the brands at present in general use, giving plenty of detail without hardness, the general tone being that of a good platinotype, from which the results were scarcely distinguishable. Members' attention is called to the lantern night on February 20th.

**Sydenham.**—An ordinary meeting was held on the 3rd inst., Mr. Thomas W. Rumble in the chair. After the usual business, the Hon. Sec. (Mr. H. H. Gray) read a paper on "Lantern Slides." Having given a general description of lantern slide making by contact and reduction, he brought before the notice of the members Beach single solution Eikonogen developer, and passed round a set of slides developed by this formula. These slides showed good detail in the shadows and clear glass in the high lights. A vote of condolence with the President was passed, he being still too unwell to attend the meeting. The next meeting will be held at the same place on Tuesday, February 17th.

**Sutton.**—The ordinary meeting was held on the 3rd inst., the President (Mr. De Clifford) being in the chair. After the transaction of the usual business, Mr. Baker, of Wallington, exhibited a simple but ingenious arrangement for cutting prints to any vertical line. It promises to be a useful addition to our photographic accessories. An interesting hour was then spent in inspecting the monthly competition prints (genre and figure studies) kindly lent by the Editor of the AMATEUR PHOTOGRAPHER. The next meeting will take place on March 3rd, when the rules for the monthly prize competitions will be discussed and re-arranged.

**Utttoxeter.**—This Association held a very successful conversazione, exhibition of work and lantern slides on the 29th ult. Some excellent photographs were shown by the Vice-President (the Rev. C. F. Lowry Barnwell), and by Messrs. A. Parker, R. Hardy, Bamford, Walker, H. Meynell, and R. Ainsworth. Through the courtesy of the Editor of the AMATEUR PHOTOGRAPHER, No. 18 set "Inland Scenery" competition photographs were exhibited. Mr. R. Keene, Derby, also kindly sent a fine collection of platinotypes, which were much admired. In the interval refreshments were provided. A number of interesting slides of Boston, U.S., kindly lent by the Liverpool Photographers' Society, were then thrown on the screen, and this concluded a very pleasant and successful initial effort of this young but promising Association. On Wednesday evening, February 4th, the annual meeting was held at the Society's rooms, Carter Street, Utttoxeter, when the whole of last year's officers were re-elected, and the excursions for the coming season were selected.

**West Kent.**—At the meeting held on the 4th inst., the Vice-President (Mr. A. R. Dresser) in the chair, the adjourned discussion on Mr. Dresser's motion at the previous meeting as to any one living at a distance wishing to join the Society was again brought forward. It was proposed by Mr. Clare, and seconded by Mr. Lloyd, and carried, "That an amateur photographer, not living on the South Eastern Railway (loop line) might become a member of this Society on payment of half the subscription (5s.), with no voting power." A demonstration was then given on "Flash-Light Photography," several photographs being taken and excellent results obtained. The remainder of the evening was spent in passing through the lantern slides by Messrs. Lloyd, Court, Foy, Dresser, Jones, and Hawkins. The next meeting will be held on Wednesday, February 18th, Board Room, Bexley; Mr. Willis on "Platinum Printing."

**Wimbledon.**—At the meeting on the 6th inst., the Hon. Sec. (the Rev. H. G. Allfree) read a paper on "Photographic Printing." He reviewed the several kinds of paper now in use, with their several characteristics, and showed how serviceable the different processes of printing are for obtaining good and artistic pictures with widely different qualities of negatives. He detailed fully the separate processes of toning and finishing, and gave many useful hints for success in work. The Fry Manufacturing Company, and also the Britannia Works Company, will give practical demonstrations on February 20th and March 6th respectively, on "Bromide Enlarging" and "The Use of Alpha Paper." The Society will be happy to welcome any amateurs who may desire to be present on those evenings.

**Wigan.**—At the meeting on the 5th inst., the Rev. G. F. Wills, M.A., was unanimously elected President, and Mr. H. H. Wragg Vice-President. As the above gentlemen were both members of the Committee, the election of two others to fill the vacancies was necessitated; Messrs. J. A. E. Lowe and F. Hughes were therefore elected. The subject of "papers" was next introduced, with the result that several were promised. The President is to provide one for the next monthly meeting, the subject not being decided upon. Mr. Lowe promised one on "A Visit to Switzerland"; Mr. Varley on "Lens Making," with demonstration, etc., etc. Thursday, the 19th inst., is a lantern night. Members are therefore requested to bring a few lantern slides for exhibition.

## To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance, the number and full title of the query referred to.

## QUERIES.

4493. **Toning Bath.**—I use a toning bath composed as follows:

Acetate of soda ... ..	120 gr.
Carbonate of soda ... ..	5 "
Chloride of gold ... ..	5 "
Water ... ..	20 oz.

How shall I keep it up to strength? Besides adding gold, is it necessary to add the other ingredients also?—**RING**

4499. **Hand Camera v. Camera and Tripod.**—Will any amateur of experience tell me (1) For all considerations which is the better, a hand-camera or one of the ordinary type, i.e. camera and tripod? (2) If the former, would he recommend a Kodak (half-plate)? But if the latter, what make would he advise? I have hitherto used the Instantograph?—**ANAXAGORAS.**

4500. **Coloured Glass Luminous.**—I wish to know how to make coloured glass very luminous in the dark. Would it be affected by damp, and how long would it be likely to keep luminous?—**EXPERIMENT.**

4501. **Kallitype.**—Would some correspondent of the **AMATEUR PHOTOGRAPHER** with a knowledge of chemistry kindly say whether prints made by this process are likely to be permanent?—**DOUBTFUL.**

4502. **Dry Plates.**—Will some one kindly give me the names of some of the best plate makers in the United States?—**W. R. P.**

4503. **Fog.**—Will some one kindly tell me why a print, taken from a negative which does not appear fogged either by reflected or transmitted light, appears hazy, and whether there is a cure for same?—**W. R. P.**

4504. **Exposure Note-Book.**—Can any one tell me whether an exposure note-book can be procured in the United States, giving exposures for the different States?—**W. R. P.**

4505. **Installments.**—Would some one kindly tell me where I can obtain photographic apparatus by payment in instalments?—**CAMERA.**

4506. **Artistic Lighting.**—Would some one kindly say how best to secure artistic lighting and position of sitter to take portraits in small greenhouse? Door into greenhouse faces north, and dead wall opposite door would probably be position of sitter, roof is glass.—**B.**

4507. **Exposure.**—What is proper exposure in sunshine for portrait outside, sitter being placed in shade, stop 32, at 12 o'clock February; also exposure, strong foreground, 12 o'clock, February, sunshine, 32 stop, flood ordinary plates?—**B.**

4508. **Flash Lamp.**—I have a Lancaster International quarter-plate camera. Is it possible to take instantaneous pictures by the aid of a flash-lamp with it? If so, could any reader inform me of a reliable cheap lamp?—**H. W. THORNTON.**

4509. **Kaleidoscope.**—Can any of your readers inform me how to make a kaleidoscope for optical lantern, describing the kind of lenses required with their focal lengths?—**SUMMERS.**

4510. **Hypo and Alum.**—Can any brother amateur give me a formula for Leisegang's combined bath, using chloride of magnesium and tannin in place of hypo and alum?—**ESBROS.**

## QUERIES UNANSWERED.

Feb. 6th.—Nos. 4478, 4479, 4491, 4492, 4493, 4495, 4498, 4491, 4492, 4495.

## ANSWERS.

4447. **Bromide Paper and Hydroquinone.**—See page 41, the **AMATEUR PHOTOGRAPHER**, January 16th, 1891.—**OSIRIS.**

4449. **Hand Camera.**—Lancaster's Rover, or the Talmer, ought to suit you, or the Optimus Magazine.—**OSIRIS.**

4453. **Enlarging.**—You will find all you want in Wall's "Dictionary of Photography."—**OSIRIS.**

4456. **Shutter.**—Lancaster's See saw Shutter, just the thing you want.—**OSIRIS.**

4457. **Oxy Benzine Light.**—Full information will be found in the "British Journal Almanack, 1890," page 401.—**OSIRIS.**

4483. **Photo-Mechanical.**—Wilkinson's "Collo-type and Photo-Engraving," new edition, price 5s.; and Schnauss' "Collo-types and Photo-Lithography," 5s.; both to be had from Messrs. Hazell, Watson, and Viney. Collotype is the best process.—**OSIRIS.**

4471. **French Scientific and Optical Instruments.**—Perken, Son, and Rayment, 99, Hatton Garden, would help you in any way.—**OSIRIS.**

4480. **Eastman's Transparent Films.**—To develop six or more quarter-plate negatives in one dish, proceed in this way. Take a 10 by 8 porcelain dish, pour in 6 oz. developer, have by your side a clean bowl of clean water. Cut off at indicator, mark not more than three feet of film, take hold of this at each extreme end with thumb and finger of each hand, get the right-hand end well under the water in bowl, drawing it quite through from end to end until limp, drain for one second, then proceed in the same way through the developer, making quite sure the film gets evenly covered in every part until you can just see where to divide the pictures; then pass again through the same water as before, to stay the development while you separate with scissors into negatives, then put the separated negatives, all of them, back into the developer to finish; wash and fix in the usual way. You must not use the same developer for a second batch. If for six negatives only, 4 oz. of developer in a 7 by 8 dish would be quite sufficient.—**H. S. LARGE.**

4484. **Celluloid Films.**—Fry's celluloid films are excellent in every respect. "Lizzie" should try the exposure before starting on her tour, as the "60 time" film is not nearly so rapid as its title suggests, but is very suitable for landscape work. Care must be taken to keep the films quite flat in the slides.—**MELCHIOR.**

4484. **Celluloid Films.**—I took a quantity of England's ordinary celluloid films abroad with me last autumn, and found them work remarkably well. I have no experience of any other films except Eastman's rollable ones. These would require a roll-holder to be attached to the camera.—**C. E. F.**

4484. **Celluloid Films.**—"Lizzie" will find the films made by Mr. Fitch, 31, Angel Road, Brixton, answer her purpose in every way and a most perfect film.—**J. E. ELLAM.**

4484. **Celluloid Films.**—England's are most satisfactory, perfect in coating, and altogether the best I have used.—**WM. MAYLAND.**

4484. **Celluloid Films.**—I can recommend Fry's celluloid films as thoroughly reliable.—**D. NICOL.**

4486. **Instantaneous Photographs.**—I can thoroughly recommend Crouch's Presto hand-camera (not Frank's), which is fitted with one of his single lenses. I would advise "Initium" to call or send to 66, Barbican for specimens. This lens is a marvel. I took a splendid negative of a church (5 sec., f/16) at 7.30 a.m. last month, all lines in perfect perspective and wonderfully sharp.—**SARACEN.**

4486. **Instantaneous Photographs.**—Certainly instantaneous photographs can be got by a single lens, but it is better to use a rapid rectilinear.—**D. NICOL.**

4487. **Sodium Hyposulphite.**—One ounce of water will dissolve two-thirds of an ounce of sodium hyposulphite; *vide* table of solubilities at end of Annuals.—**J. VERREKER.**

4489. **Fixed-Focus Lens.**—I would recommend you to get one of Messrs. Taylor, Taylor, and Hobson's detective lenses. Their address is Slate Street Works, Leicester.—**D. NICOL.**

4490. **Rever. al.**—I should say that "E. T. R." has accidentally put the glass side of the plate next to the lens instead of the film side. He can print all right from the negative by using the single transfer carbon process.—**J. G. P. VERREKER.**

4490. **Reversal.**—You probably had your plate wrong-side out in the dark-slide, so that the picture was taken through the glass and not direct on to the film. In future, be careful to have the films outwards.—**TE WIRIMU.**

4493. **Platinotype.**—If "H. I. C." is using the hot-bath process, his paper has, no doubt, got damp. Does he place a sheet of india-rubber or waterproof paper between his paper and the pad in the printing frame? or is his chloride of calcium in the tube soft and damp? If so, he must take it out of its bag and dry it in a shovel over the fire and replace it. If this will not explain it and he cannot get pure whites, his paper is probably spoilt by age.—**J. G. P. VERREKER.**

4493. **Platinotype.**—Let "H. I. C." examine his negative carefully. If this is good and sharp it ought to give good prints, either platinotype or silver, but if it is not perfectly so, probably silver

prints obtained from it would appear somewhat clearer and better than platinotype.—**G. E. F.**

4494. **Shutter.**—Kershaw's "Blind" shutter is a thoroughly reliable and efficient shutter, and one which gives general satisfaction.—**D. NICOL.**

4496. **South Africa.**—I would advise "Nemo" to take whatever plates, developer, and lens he has been used to. I lately revisited South Africa with a camera, taking with me Paget's xxxxx. These all came out too thin, owing, as I afterwards proved, to the unsuitability of the hydroquinone developer I used. Previously I had always used pyro, but took hydro as being more portable. Unfortunately, they were all spoilt in intensification, owing, I have no doubt, to the presence of some deleterious substance in the water I used. I got some Mawson and Swan's Castle negatives in Pietermaritzburg, and they made fair negatives, but the best were on a few Vergara films I had. These are not made now, which is a pity, as they were excellent. I believe the actual best plates are Paget's xxx, and Thomas' landscape. I used an Optimus Euryscope, an old Dallmeyer meniscus, and a wide-angle of French make. I believe the single lens is the best. The light in Africa varies a good deal, but in spring (September and October) is intensely actinic. If "Nemo" is going to Mashonaland he will find it especially so, but in the valley of the Zambesi it is very hazy. As for paper, he had better take out some rolls of albumenised or plain paper, and sensitise it himself. No paper will keep long. I found Pizzighelli platinum so curiously affected that it printed out, the acid bath acted as a developer, and blackened the paper all over instantaneously; if printed, until in a faint outline was visible the bath developed it to a fair print. Bromide papers keep best in a tin case.—**G. LACY.**

4497. **Machine for Enlarging Drawings.**—The apparatus for enlarging (or reducing) drawings by rubber sheet is used by lithographers (many of them in this country) where work on a stone can be transferred to the rubber (previously coated with composition). The rubber is then expanded, and when transfer is stretched to required size, transferred to stone (while expanded). If enlargement is too great for one expansion, it can be repeated several times, the image being transferred to stone after each expansion. With enlargements the faults of any transfer are magnified, the reverse being the case when the drawings are reduced. Very beautiful results are obtained when reducing, the work being in very fine lines. Unless the machine can, however, be kept in use daily, for small sizes it is just as cheap and very much handier to use photo-lithography. Agents in this country—**B. Winstone and Son, 100, Shoe Lane, London, E.C.—STAG.**

4497. **Machine for Enlarging Drawings.**—If "Istriel" will apply to **B. Winstone and Son, 100, Shoe Lane, Fleet Street, E.C.**, they will give him full particulars.—**TURNER.**

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us **BEFORE TUESDAY MORNING'S POST** if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—**ED: AM: PHOT:**

**NOTE.**—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.

**HENRY WILES.**—We do not quite understand what you require to do. Please write fully, and we will then endeavour to help you.

**B. NELSON.**—Wash your negatives well, then bleach in solution of mercuric chloride, wash well, and flood with a 10 per cent. solution of Schlippe's salt (sulphatimonite of soda).

**F. O. KERDEL.**—The negative is over-exposed and under-developed, the plate should be nearly black before removing from the developer. The print is under-printed and over-toned; for a veritable first attempt, however, it is good. Let us see some more work in a month.

**T. HALL.**—You must expect a few "spoilt negatives" at first. We shall be very pleased to help you as far as we possibly can. (1) The apparatus named will, with competent hands, turn out good work. (2) You must, before giving any details of exposure, find out the ratio aperture of your lens diaphragms (see **AMATEUR PHOTOGRAPHER**, January 16th). Still, as to your prints. (1) Over-exposed and fogged in developing. (2) Not sufficiently developed, plate fogged at the top from the dark-slide not being properly shut. (3) Over-exposed. (4) Over-exposed and under-developed. (5) Over-exposed and fogged in development. (6) Not sufficiently developed, plate fogged at the top. (7) Out of focus, fogged in developing. Let us know what books you have on photography, and send formula of developer you use.

**VINDEX.**—The "View" camera is a capital instrument. The extra long extension is specially useful

for copying, and you would find it very useful with the "Doublet" lens you have chosen, which we cannot improve on.

**ASHTON.**—No. 1 is frightfully over-exposed. No. 2 is not so much exposed. No. 3 is not so bad as No. 1. Cut your exposures down a little, and use a little more bromide in the developer. No. 2, it strikes us, might be a little sharper focussed. The prints were covered with crystals of some kind. Do you wash well between hypo and clearing?

**M. S. D.**—To mount the prints you must use a warm solution of gelatine, 20 gr. to the ounce, and place the glass and print in this and then squeeze together. The print is a good one. We hope to be able to publish particulars in a week or so.

**F. YOUNG.**—The negative is slightly fogged, but otherwise calls for no special comment, and is of the usual character of Eikonogen images. (2) We should not advise you to separate the lenses, but sell them and buy a 6-in. lens.

**C. A. T.**—The negative is so fogged in developing that it seems almost impossible to say whether under-exposed or over-exposed. You will not obtain any decent results in such work till you use colour-sensitive plates and a yellow screen. We shall be pleased to give you any help we can if you will call any Monday afternoon or send us your address.

**F. PARTRIDGE.**—(1) The clearing bath may be used over and again. (2) What sort of frames do you want—metal, or plush, or wood?

**DARK-ROOM.**—See the *Photographic Quarterly*, April, 1890. An able article by Mr. C. H. Bothamley, F.I.C., F.C.S.

**D. MACADAM.**—Very well, but really we ought not to be at any expense in loaning societies the prints sent to our photographic competitions.

**PERCY SHEARD.**—We cannot enter upon a correspondence as to why the photographs did or did not obtain awards; as to our criticism of them, that will appear in the book "Holidays with the Camera," if you elect to leave the prints in our hands.

**TRAVELLER.**—(1) It is necessary and advisable to go with your passport to the police, who will give you every assistance. Many places are free, but ruins, etc., are carefully and jealously watched over. (2) For touring, films are decidedly preferable. (3) B or E new pattern.

**CAB. PHOTO.**—We will write you by post.

**SUNESIS.**—Thank you for your letter. The excess was noted too late. We shall for future competitions make a more stringent rule in this respect. The publication of an answer does not mean that no other competitor gained equally high marks. Your answers to 1, 2, 3 were received and marks awarded.

**R. C. MACLEOD.**—If the questions do nothing else, we shall be satisfied if they set you hard at it. May we suggest you limit your studies, however, more particularly to photographic chemistry; you will find ample occupation in reading up all you can on this subject without entering into any wider fields. We shall be pleased to assist you in any way, either by suggesting books or a complete course, and also by helping you out of any difficulties.

**FLEX.**—Much obliged to you, but we may suggest that did you fill either of the positions suggested in your letter, you would probably change your mind. The examiners cannot admit your answers, and if they did, could not award you many marks for answer 7, which contains many inaccuracies. You will be able to compare your answer to No. 9 with the published answer.

**H. G. BRIERLEY.**—The quantity varies, but from 4 to 6 feet is about the usual run.

**LEO.**—No. 1. There is much too strong a light on the sitter's eyes, and if you had carried development a little further you would have got a better result. We have made a print from your negative and, if you like, you can see it. A shorter exposure and a little longer developing would have improved matters. Do you want print and negative back? Your second letter to hand. We will write you.

**J. S.**—A great deal depends upon the quality of the other prints sent in, but the work is good. We have kept three, which are the best, and are much obliged to you. We shall hope to see you soon as a competitor in our competitions. Had you got a little more detail in the recumbent figure on the tomb, this print would have been perfect, and had you swung the gate open and removed the figure this picture would also have been improved.

**W. F. FOY.**—(5, 6, 7, 8) Much over-exposed; plate not developed enough. Not one plate has been sharply focussed, and most of them have got double outlines from movement during exposure.

**FOREIGNER.**—(1) You will probably have noted that your camera was not quite level, consequently the east window leans to one side, otherwise this is good. Did you back your plate? (2) Here a backed plate was essential, and we should have placed the dark table the other side of sofa. The camera was not level here; note the slanting line of the top of cabinet and extreme edge of window on left. We should have also cleared out the settee so as to show more of the cabinet and its treasures; the exposure was just right, however. (3) Cut off half an inch of the lower part of print, and, had you placed your camera the other side of water and about two feet from the ground, you would have got another picture. We should also have made the water wheel on the left more prominent or given it a plate to

itself. (4) Good. We fancy your lens is rather too short a focus; you would get more artistic results by using one of rather longer focus. Considering the short time you have worked, you are to be congratulated on such good results. Will you send us some more in three months' time? The print, as you suppose, is on the back of the albumen.

**R. N. BREALEY.**—You can take a seascape by moonlight if you like, but all the commercial pictures of such a class are obtained by taking such a scene right against the sun with a quick shutter exposure. No. 2 is the better of the two. We will insert your query next week, as we know of no such book.

**ST. BERNARD.**—A would be quite suitable, but there would be practically no gain in depth of focus over B. The second series are decidedly inferior in definition, rapidity, and working aperture. We should prefer B to the second series. The shutter should be placed just before the diaphragm, and the full aperture of the shutter should be larger than the diaphragm aperture, practically the full size of hood. We prefer the drop shutter.

**R. CLAPHAM.**—Very much better results can be obtained by the use of ordinary matt-surface paper. The idea is by no means new, about fifteen years old, although the effect is as you say.

**H. H. GRAY.**—Our objection was not to the term "camera club," but to the absurd use of the word "amateur."

**LUX.**—It is quite possible the articles will be published in book form, but no definite arrangement has been made.

**J. THOMAS.**—A very fair lens with good covering power. Horizontal pictures only can be taken with the camera as at present made, but it would not be difficult to adjust it for vertical pictures.

**E. PERRETT.**—We should advise hand-cameras Nos. 3, 6, or 7. They are the best in the list.

**R. E. NICKERMAN.**—We have no knowledge of the lamp mentioned. The burnishers are well worth buying.

**HAND-CAMERA.**—If you want a cheap camera have No. 2, but if prepared to spend more money, go in for the larger sizes of No. 3. Will possibly write you later on.

## Quarterly Examinations in Photography.

### QUESTIONS.

13. Explain the chemistry of fixing. Is there more than one variety of fixing bath? Give formulæ, and state advantages and disadvantages of each.
14. How would you intensify a plate with very dense high lights and very weak shadows?
15. Describe the method of developing bromide paper with ferrous oxalate.

(Latest Day for Answers—February 23rd.)

### RULES.

1. Answers must be received on the morning of the Monday week following the publication of the question.
2. All answers must be preceded by the question, and should be written on one side of the paper only.
3. A *nom de plume* may be used, but in every case the full name and address must also be given.
4. Answers must not exceed 250 words, unless otherwise stated by the examiners.
5. Those desirous of competing must apply to have their names entered, as these examinations are intended to encourage the study of the theory and practice of photography. Authorities upon photographic matters and contributors to the photographic journals will not be allowed to compete.

Marks will be given for all answers, and when possible, the three best answers will be published. Three prizes will be awarded at the end of each quarter.

All communications to be addressed:—

"EXAMINATION DEPARTMENT,"  
AMATEUR PHOTOGRAPHER,

1, CREED LANE,  
LONDON, E.C.

## Sale and Exchange.

**RULES.**—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny Stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or words,

counts as one word; compound words count as two words.

**REPORTING UPON APPARATUS.**—The Editor of the AMATEUR PHOTOGRAPHER will be pleased to report, to any intending purchaser, upon apparatus, etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the SELLER to him to the offices of the AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending BUYER to pay a fee equivalent to a commission of 2½ per cent, the minimum fee being 2s. 6d., upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the SELLER. As far as possible, the Editor will undertake to send a report within TWO DAYS of receipt of goods.

### DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

Advertisements can be inserted under a number, the name and address being registered and letters forwarded for a fee of 3d. to cover postage.

**N.B.**—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

"Amateur Photographer" bound, complete from beginning; what offers cash?—Rector, Elm, Frome.

Seven vols. AMATEUR PHOTOGRAPHER, five bound, splendid condition, from 1887 to date; what offers? Smith, St. Peter's Vicarage, Hammersmith, W.

"Amateur Photographer," etc.—AMATEUR PHOTOGRAPHER, vols. vii., viii., ix., x., xi., xii., unbound; "Photographic Societies' Reporter," vol. i., unbound, sale or exchange.—Percy Morris, School Hill, Lewes.

114 AMATEUR PHOTOGRAPHERS, 73 "Photography" clean; what offers?—17, Sedan Street, Walworth.

Backgrounds.—Two flatted oil backgrounds on rollers, landscapes with trees, 8 ft. by 7 ft., as new; 10s. each; photographs sent; bargains.—William Hare, Photographer, Sutton, Surrey.

Bicycle.—Will exchange Hillman, Herbert, and Cooper's model E diamond frame safety bicycle, 1890 machine, very little used, and all accessories, cost £13, for a good half-plate camera and lens, three double backs and tripod, and some cash. What offers?—F. Norman, 18, Basset Street, Kentish Town, London.

Burnisher.—Burnisher, half-plate, with lamp, complete; 8s.—White, Stores, Arlington, Wantage, Berks.

Cameras, etc.—Enlarging camera, whole-plate, Lancaster's, quite new; also a gas regulator.—P., The Friars, Muswell Hill.

5 by 4 camera, Gotz's patent, central swing, revolving disc for lens, every possible movement, beautifully made, also four double backs, with carriers for quarter-plates, complete set of Eastman's patent film carriers, all newest condition; price £26. No. 110, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Watson's 10 by 8 Premier camera, in solid leather case, with one double dark-slide, equal to new, with or without Ross lens, also Ashford tripod, cheap; ill-health reason for selling.—Address, Gwen, care of Penn, Stationer, Maidenhead.

Cameras, Lenses, etc.—Tourist camera (by Ross), 7½ by 4½, one double slide, removable partition for thin leather case, in good condition, £2 10s.; pair Ross' single stereo lenses, £1 10s.; or exchange good quarter-plate camera and slides.—Collins, Chalont, Bucks.

Lancaster's half-plate Special camera, 1890, rectilinear lens, stops, three double dark-slides, tripod, with revolving top case, burnisher, plate-washer, etc.; the lot, or separately, what offers?—Mottram, Ventnor Villa, Kingswood Road, Moseley, Birmingham.

Half-plate Lancaster's Merveilleux camera, lens, tripod, and three Tylar's metal dark-slides, all in good condition; first offer of £1 has the lot.—Bond, Wharf Road, Bishops Stortford.

Half-plate Criterion camera, three double backs, Optimus 7 by 5 R.E., canvas case, all nearly new; price £8 10s.—N., Abbotfield, Mannamead, Plymouth.

12 by 10 solid mahogany studio camera, brass-bound, 2 ft. long, winding out to 3 ft. 3 in., further extension of 10 in. for copying and enlarging, usual carriers, extra backs for 9 by 7, double cabinets, cards, upright and horizontal, midgets, etc.; £4.—W. Nayland, Winwood, Tunbridge Wells.

Camera, 7½ by 5, special make, extending to 18 in., sky shade, pneumatic shutter, six light double dark-slides, shutter, drawing right out, Dallmeyer's R.R. 8 by 6, strong waterproof cases, holding entire kit,

extra high stand, 5 ft. 4 in.; £9; as used for my marine series.—Wm. Mayland, Winwood, Tunbridge Wells.

Lancaster's quarter International camera, three double slides, perfect condition, Ross' landscape lens and case, f/0.3; also Optimus half plate wide-angle lens, quite new, 42s. Wanted, R.R. 5 by 4 lens, good maker, cheap, or exchange.—Gibbs, Manchester House, Bedminster, Bristol.

Lancaster's stereo camera, Instantograph, with best lenses and instantaneous shutter, and three double slides, £3 5s.; Dallmeyer's 18 lens, £2 10s.; Dallmeyer's 10 by 8 triplet, £3 10s.; Ross' 2A portrait lens, £8.—J. Biddle, 97, Medlock Street, Manchester.

Instantograph, half-plate, reversing back, long-focus leather bellows, Instantograph lens and shutter, Iris stops, double slide, folding mahogany stand, developing dishes, printing frames, ruby lamp, measure, etc., finest order; 80s.; approval.—Cooper, 9, Sussex Terrace, Markfield Road, Page Green.

Gas Bag, etc.—Gas bag, once used, cost 39s., price 20s.; pressure boards, 7s. 6d.; retort, 5s.—Harrison, Spring Terrace, North Shields.

Hand-Cameras, etc.—Kodak camera, No. 4, plate 4 by 5, with 10 exposures, never been used, in case and manual, complete; in for £3; ticket to be sold cheap.—Apply, C. Clarke, 140, High Street, Camden Town, London.

Hand-camera, automatic changing, holds 12 quarter-plates, with lens, shutter, finder, etc., complete, price 42s. 6d.; whole-plate long-extension bellows camera, all movements, one double back, price 70s.—T. Mercer, 13, King Street, Sparkbrook, Birmingham.

No. 1 Kodak, cost £5 5s., only used once, contains about 60 films still unexposed; £2.—Geo. Wheeler, 46, King Street West, Manchester.

Lenses.—Dallmeyer's half-plate triplet lens, very good condition, cheap; 50s. or offers.—H. Cooke, 3, Weekday Cross, Nottingham.

6 by 4 Euryscope, f/6 lens; Waterhouse stops, bargain, 18s.—R. Henry, 2, Hawthorn Villas, Slad Road, Stroud, Glos.

Rapid rectilinear lens, half-plate, loose hood, fine definition, suitable for either views, portraits, architecture, etc., in finest order, and fitted Waterhouse stops; 27s. 6d.; approval.—Thurlow, 23, Gotha Street, Victoria Park, E.

Ross' quick-acting carte-*à-visite* portrait lens, 6 in. focus; cost £11 10s.; price £3, or offers; perfect condition.—No. 109, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, Ludgate Hill, E.C.

Euryscope lens, quarter, as new, stops, case, etc.; only 30s.—Ralph Saunders, Exminster, Devon.

Pair of Dallmeyer's rapid landscape stereo lenses, f/10, Nos. 9344, 9345, with extra flange for hand-camera, perfect condition; price 52s. 6d.—Smith, 393, Alfreton Road, Nottingham.

8 by 5 R.L., 50s.; 7 by 5 portable symmetrical, 40s.; 5 by 4 ditto, 28s. (all Optimus make); 15 by 12 Ross' single, conical mount, £2; pair compound stereo lenses, £1. Wanted, quarter-plate camera, prefer

one with six backs and brass-bound Ross' P.S. lenses No. 5 and 6.—Collins, Chalfont, Bucks.

Pair Optimus 5 by 4 rectilinear lenses, for stereoscopic work; £3.—Geo. Kilburn, Eastfield, Batley Carr, Dewsbury.

Lancaster's half-plate instantaneous view lens, Iris diaphragm; cash offers.—Summers, 143, Stanstead Road, Forest Hill.

Ross' quarter-plate portrait lens; 30s.; bargain.—55, Bore Street, Lichfield.

Lenses, etc.—Lancaster's half-plate Instantograph lens and shutter, Iris diaphragm, f/10 to f/80, new; 21s.—E. Mi hin, 162, York Road, Lambeth, London.

Valentine's cabinet portrait lens and new mahogany drop shutter to fit; price 30s.—W. Rose, Westcott Street, Dorking.

Sets.—1891 Underwood's quarter-plate Compactum set, new; bargain, 14s. 6d.—John Slade, 51a1 Road, Stroud, Glos.

Half-plate International set, three slides, leather case, good condition; £1.—Thomas Clarke, Athelnum, Manchester.

Half-plate International set, Iris diaphragm, lens, four double slides (three Tylar's metal, with screen), and one single, in good waterproof case, and tripod in case, price 70s.; also Ross' stereoscopic Tourist camera, three double slides; 60s.—J. B., 14, Bartholomew Villas, Kentish Town, N.W.

Splendid half-plate set, Thornton-Pickard Tourist, as new; cost £15; what offers? approval pleasure. Wanted, whole-plate set, same make preferred.—Photographer, Wollaston, Wellingboro'.

Whole-plate set, complete, Lancaster's 1891 extra-special camera, brass-bound, with every movement, three double backs, Optimus R.R. 9 by 7 lens, Ker-shaw shutter, and folding tripod stand, the whole good as new, in leather-bound case; cost £17; will take £12; a bargain; or exchange for half-plate set, complete, and cash.—E. Blow, 45, Clyde Road, Addiscombe.

Shutter.—Drop shutter, half-plate, mahogany; cost 8s. 6d.; price 4s. 6d.; as new.—F. Thornton, 15, Bromley Road, Beckenham.

Sundries.—Cassell's "British Battles," four vols., complete; unbound; Stirra's vest camera; will exchange with cash for cabinet portrait lens or hand-camera, or sell separately.—Robert Hamilton, Ladeside, St. Strathaven, Scotland.

Denoulin's photometer, 4s.; Ward and Lock's "Universal Instructor," complete in 45 parts; what offers in photography?—Mr., 30, Dunlase Road, Lower Clapton, London, E.

Splendid 4 in. double condensers magic lantern, portrait lens, in travelling case, almost new, only 21s., worth 50s.; several photographic slides at 3s. per dozen; about 230 AMATEUR PHOTOGRAPHERS, can, 5s. 6d.; several dozen quarter-plate negatives of Cornish scenery, etc., good, 2s. 6d. per dozen; also larger sizes, cheap; 10 ft. lantern sheet, with rings, new, 5s. 6d.—Dalby Smith, St. Thomas Street, Weymouth.

Tents.—Eclipse ruby tent cost 25s., in good con-

dition; for 12s. 6l.—F. W. Ferry, 92, Malmesbury Road, Bow, London, E.

Tripod, etc.—Half-plate folding mahogany tripod, 5s.; 12 by 10 retouching desk, 4s. 6d.; exchange 12 by 10 metal slide.—Cooke, 49, Chapel Street, Rugby.

Violin, etc.—Valuable bargain. Fine mellow-toned violin, in perfect preservation, suit lady or gentleman for orchestral or solo playing, complete with bow, baize-lined case, and accessories; take 15s. 6d. for the lot; violin alone worth double; money willingly returned if not approved. About 20s. worth of unsold music will be given in free.—Graham, College Buildings, Ipswich.

## WANTED.

Cameras, etc.—Whole-plate or 10 by 8 modern camera and slides.—Evans, Stationer, Conway.

Cameras, Lenses, etc.—To purchase second-hand cameras, lenses, and photographic sundries for prompt cash. Immediate attention given to all correspondence.—Amateur Photographic Depot, 71, Oxford Street, Manchester.

Hand-Camera.—Kodak, No. 3, hand-camera, complete, in new condition; will give in exchange Ross' R. S., 7½ in. focus, half-plate lens, with Waterhouse diaphragms, cost 5 guineas, equal new, and half-plate burnisher.—Barton, Morriston, Elgin.

Hand-Cameras, etc.—Shew's Eclipse quarter-plate hand-camera and stand, cheap for cash.—No. 112, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Lanterns.—Lantern, optical and enlarging combined, by good maker, strong and cheap.—Reynolds, 17, Camberwell Station Road, S.E.

Lenses, etc.—Lens and shutter for home-made hand-camera, about 4½ in. focus, quarter-plate, good, cheap.—Coppall, Solicitor, Worcester.

Used celluloid film, also quarter lens and 3 slides.—Abel, Carriers Dock, Liverpool.

Outfit.—Quarter-plate outfit, cheap, or exchange for Cassell's "Household Guide," bound calf, new.—Armitage, Station Road, Slaitwaite.

Set.—Half-plate, complete, Underwood preferred, cheap.—Chas. Stone, 126, Southampton Row, London.

Sundries.—To purchase dishes, printing frames, measures, leather case for half-plate camera, and other photographic sundries second-hand, must be good.—B. Farke, Fernleigh, Woodsetton, Dudley.

## Lantern Slide Exchange.

NOTE.—There is NO CHARGE for insertion in this column. All announcements must be received by Tuesday morning.

F. C. A. Willersley, Cromford, Derby, has several sets of slides which he is tired of, "Dick Whittington," "Sinbad the Sailor," etc. Will be glad to hear of anyone willing to exchange.

## VEVERS' WINTER SPECIALITIES!!!

**Magnesium Flash Pistol.**  
No blowing! nothing breakable!  
Complete in box, with instructions, 1/-; post free, 1/3.

**Magnesium Flash Lamp.**  
In box, complete, with directions. With mouthpiece, 1/3; with pneumatic ball, 1/6; postage, 3d.

On receipt of negative and P.O. for 2s. 6d., we will send, carriage paid, a First-Class

Enlargement, on a 22 by 16 Mount, ready for framing.

For full particulars of above, and every Lantern accessory, Slides, Jets, Lamps, Oxygen in Cylinders, Toy Sets, and hundreds of useful Novelties, see

**LANTERNS.** Japanned, 4 in. condensers, 30/-. Russian iron, 4-wick Lamp, 43/-. Mahogany, with door, etc., 57/6. Bi-unial, brass stages, etc., £8.

(Full particulars in Catalogue, 2d.)

**VEVERS' PANORAMIC SLIDE CARRIER, 1/2.** post free, 1/5.

**VEVERS' COLOURED SLIDE BINDERS.** in Orange, Lilac, Pink, Blue, Bronze Blue, 100 in neat box. 6d.; post free 8d.

**SELF LIGHTING GAS BURNER, 2/6** post free 2/9

in neat box. 6d., we will send, carriage paid, a First-Class

**C. C. VEVERS, 12, MARKET ST., BRIGGATE, LEEDS.**

Vevers' New Catalogue, post free two stamps.

Now Ready. Crown 8vo, 90 pp., Cloth, 1s. 3d.; Paper Covers, 1s.

ON Monday we had the pleasure of exhibiting the AMATEUR PHOTOGRAPHER 1890 Prize Slides at the Palace, Maidstone, to a large and select audience, members of the Maidstone Amateur Photographic Society and their friends. The slides excited much interest, especially as the President, Mr. John E. Austin, was a prize winner, having been awarded a Gold Medal for the slides contributed in Class II., Figure and Genre Subjects. The Maidstone Society, thanks largely to the energy and ability of the President, is flourishing in every way. It now numbers some fifty members, many of them very active workers in photography, the success of Mr. Austin having a very stimulating effect upon them. The district in and around Maidstone is eminently fitted for photographic work, the quaint traffic on the Medway, the beautiful Kentish homes, and the glorious woodland scenery being ever at hand to tempt picture makers. It was our privilege to be Mr. Austin's guest, and we were delighted to have an opportunity of spending an hour of two with him in his dark-room and studio. Mr. Austin is a man of method and order. He registers his failures quite as religiously as his successes, and it was instructive to note the trouble that he takes to secure the best result from his negatives. He is a perfect cor-

morant for work, and we believe as a prize winner he holds his own against all comers. His first medal was awarded by Messrs. Robinson and Hastings, at Tunbridge Wells, in 1888, but Mr. Austin has been a worker for many years, and showed us wet collodion negatives taken when he was at Oxford. Since the award in 1888, Mr. Austin has never exhibited without being medalled; his record is now 51 awards, viz., 33 firsts (including 7 gold), 15 seconds, and 3 thirds. We hope that his pictures may for many years be shown at exhibitions.

WE are pleased to note that an International Photographic Exhibition will be held in the Galleries of the Fine Art Institute, Glasgow, in September next, under the auspices of the Glasgow and West of Scotland Amateur Photographic Association. Special attention will be paid to the forming of a Photo-mechanical section. We would remind our readers that one of the most delightful months to visit Scotland is September, so possibly many may be able to fit in their holidays, so that they will be able to pay a visit to the Exhibition. Mr. W. Goodwin, the Hon. Secretary, 180, West Regent Street, Glasgow, will gladly supply further particulars.

SOME correspondence has reached us with regard to the photographic rights of Messrs. Negretti and Zambra, at the Crystal Palace. Our correspondent should remember that the Palace is the property of a private trading company, and that they are perfectly justified in making any terms they please with regard to the taking of photographs within their buildings or the adjacent grounds. Messrs. Negretti and Zambra paying a heavy rental for the right, are hardly to be expected to grant permission to an amateur to take photographs even upon his promise "to make no use of them except as an amateur."

WE note that the Leicester and Leicestershire Photographic Society intend to hold a special lantern and musical evening on the 12th prox., at the invitation of the Vice-President, Mr. F. G. Pierpoint. The Secretary asks us to state that they will gladly welcome members of neighbouring societies, such as Derby, Nottingham, Birmingham, etc. If our engagements permit, we shall hope to attend.

OUR readers may be pleased to see that one of our subscribers has succeeded in obtaining a very considerably reduced rate for fire insurance. We hope to publish the name of the office next week.

It will be remembered that Mr. W. A. Brown, President of the West London Photographic Society, recently brought up the matter of cheap or reduced railway fares for photographers. The matter has been followed up with much energy, and the Chairman and Directors of all the railway companies having their terminus in the Metropolis are to be memorialised; to this end a form of memorial has been drawn up and submitted to all the London and suburban photographic societies for signature. It is to be hoped that the movement will be largely supported. It will only be, as we have already said, by united effort that those interested can expect to secure the concessions which seem so desirable.

WE must congratulate the Richmond Amateur Photographic Society on the good audience who assembled at the Lecture Hall, Hill Street, Richmond, on Monday night, to hear Major J. Fortuné Nott, F.Z.S., its President, deliver a very interesting and instructive lecture on the subject of "Wild Animals in Captivity." The lecture was illustrated by means of sixty or seventy lantern slides from photographs taken by the lecturer himself in the Zoo, the Jardin des Plantes, and elsewhere, and though he did not claim that they were good photographs, many were really excellent specimens of work. The remarks in connection with the various animals showed that the lecturer had a good grasp of his subject, which in places he treated with a light and humorous touch. It was pointed out that all animals were afraid of man, and that if they were relieved of the necessity of constantly seeking food and were kindly treated, they could all be tamed. The first of the series was a single-humped camel, a white fine-haired dromedary, which, the lecturer pointed out, only existed in a state of subjugation. The camel was probably one of the first, if not the first, of the animals caught, tamed, and utilised by man. The word dromedary simply meant racer, so that though all dromedaries were camels, all camels were not by any means dromedaries. The next picture was that of a camel and her calf in a state truly described as that of a "bag of bones." They were found on the battlefield of El Teb, and sent to the Zoo. By the miscarriage of a telegram they were saved from being killed, and a photograph of them taken three months after their arrival here was evidence of a strong constitution and assimilating powers. Some of the other pictures were the white ass of Arabia, the zebra, lion, Bengal tiger, leopard, puma, jaguar, and the seal. The lecturer pointed out that the animal which provided the sealskin in which ladies were so fond of enveloping themselves was not the true seal, but the sea-lion, which animal also possessed a mane. This fact was proved by the photograph of one of the species lying on a wall in the sunshine, so that he had got dry, and the mane was most pronounced. An audible smile was caused by the statement that in one of the natural history books used for educational purposes it was said that the general impression that a sea-lion had a mane was wrong, that the animal did not possess one. The giraffe, hippopotamus, rhinoceros (the hairy species), which cost the Zoological Society £1,250, making it the most expensive animal in the gardens, Jumbo, Alice, the chimpanzee "Sally," and many others were referred to, the whole being thoroughly appreciated by a most attentive audience. The proceeds are to be devoted to the Richmond Hospital.

It was to be expected that Dr. Emerson would reply to Mr. Davison. He has done so, and we publish his letter, minus a few paragraphs which are either irrelevant or of an unnecessarily personal nature. This being done, it is our intention to allow no further correspondence upon a subject

which has no interest to students in photography, and which has assumed the form of a bitter personal quarrel.

THE letter published from Mr. F. Smedley, on the "Uniformity of Thickness of Plates," is deserving of attention. Plate-makers have much difficulty to contend with. Still, plates of uniform thickness might, we should think, be set aside for hand-camera work. The straining of the sheath by the insertion of a thick plate militates against the perfect changing, and the insertion of a thin plate into the sheath that has been so strained leaves it loose and very unfit for exposure. We commend the matter to the consideration of the plate makers, who are certainly not lacking in enterprise.

A SUBSCRIBER writes us under date of the 14th inst.: "Last July I photographed by request the little Duke of Albany. I took eight negatives, some very good and others only fairly so. Copies were sent to her Majesty the Queen, and I had a letter from Sir Robert Collins, the Comptroller of the Claremont Household, expressing his pleasure, and saying that the Queen liked the photographs very much. On Thursday last a messenger came from Claremont, and he told me I was to send on prints of the eight negatives direct to her Majesty." We are very pleased to note that work done by an amateur photographer has received recognition at the hands of the Queen, and we hope to be favoured with at least one portrait of the infant Duke of Albany.

THE following two extracts from recent letters are interesting:—"I need scarcely add that, as a subscriber to the AMATEUR PHOTOGRAPHER from its birth, I appreciate your opinion upon matters photographic very highly. Perhaps it may be interesting to you to know that about three weeks ago I advertised a hand-camera for sale in your paper, and had twenty-one replies, which clearly shows how popular your journal is."

#### SCIENCE TO THE FRONT.

REMEMBERING the recent recantation, it is therefore peculiarly welcome that scientific photography should just now be shining with unusual effulgence. The bright lustre being radiated is produced by nothing less than the announcement of the long-looked-for and often-promised discovery of photography in natural colours.

We last week shortly referred to the communication which M. Lippmann made to the French Academy of Sciences at Paris, in which he claimed to have found a means of producing polychromatic positives, and in proof thereof he showed a photograph of the solar spectrum, in which the seven colours were clearly visible. According to further particulars since to hand, M. Lippmann has not only been able to get the seven ordinary colours on his plate, but has also secured the so-called invisible rays, *i.e.*, the ultra-violet and the infra-red ones. He has, besides, according to the *Daily News*, managed to reproduce the colours of a stained-glass window.

So many have been the claimants in bygone days of the discovery of this much-wished-for desideratum, that a reasonable amount of scepticism is pardonable.

How has this erstwhile chimera become almost a living reality? We are told that it is the outcome of what is known as the "inductive" method, and is not, in the first instance, due to experiments.

To explain in language understandable by all how the colours are said to be produced, is not easy. Shortly stated, we are told that the colours are due to the "interference" of various waves of light, causing a correspond-

ingly thick deposition of *layers* of silver. Each colour has a different wave length; for instance, that of green is half as long again as that of red. The effect of what is known as "interference" is that the rays of light are broken up into their wave lengths by a series of bright lines alternating with black (non-luminous) ones; hence it is claimed a succession of superimposed layers of silver of varying thickness are deposited where the respective colours act on the sensitised silver. Inasmuch as each of the above named layers of silver is the exact measure of the particular colour wave which caused its deposition, no other colour wave can subsequently pass through the said layers of silver; *i.e.*, shorter or longer waves cannot transmit their undulations.

The "interference" referred to is produced by means of a mirror. The sensitised film is backed by a suitable arrangement of mercury, which reflects the rays falling upon its surface.

We are told that the gelatine bromide film may be fixed in the usual manner, hence, unlike previous colour photographs, the present process is a permanent one.

At first sight the above theory seems to be one of considerable promise, and appears to endow us with the power of recording with tolerable relative accuracy the various colours of objects; but there are reasons to think that this colouring is lacking in that sharpness of definition which we are able to obtain in a monochrome photograph. This defect may in time be overcome.

If there be at the present time anything connected with the practice of the art-science which vexes its votaries, it is the exasperating ease with which the merest tyro is at times able to rival the works of the "old photographic hand." Should colour photography become an accomplished fact, there will be no more grumbling at the sweet simplicity of camera work. For instance, as colour photographs have to be developed in the usual non-actinic light, it follows that such tints as blue, green, and purple will be unrecognisable as such until the plate is fixed. In fine, should this new departure be all that M. Lippmann claims, we shall all be shortly passing through very troublesome times. Space and other considerations forbid our enlarging any further on this interesting topic, but we hope before long to take up the subject more fully and enter into minuter details, for the benefit of such of our readers who desire to test M. Lippmann's epoch-making discovery.

## Letters to the Editor.

### MR. DAVISON'S MISREPRESENTATIONS.

SIR,—There is an old adage that weak men hate none so much as those who have done them favours or taught them how to shoot. The truth of this adage is pleasingly exemplified by Mr. Davison's "reply." Mr. Davison, an "audit clerk," has found time after or between office hours to perform good secretarial work for an amateur photographic club, to write "drivel" (his own word) peppered with a grain or two of other people's property, and to take, at most, four photographs having any claim to artistic merit. In each of these the "clouding" is false, but what of that to a man who talks of values. Having done these great deeds and had his vanity flattered by a couple of portraits published in the photographic press—he begins to think himself someone, and poses in public as an authority. He has, now that his master—myself—has seen fit to abjure certain philosophical doctrines, been ungrateful enough to try and belittle me. Well, so be it. But in so doing he unwittingly belittles himself, for he has written me that I alone of photographers was an artist or knew what art was, that my book ("Naturalistic Photography") was most original (*vide* his review in *Camera Club Journal*), and he, a little while ago, brought his (pictures?) down for me to select the good ones for reproduction, and he wrote me afterwards that he had yet one he thought I should approve of. He told a

friend he was taking "pin-holes" for me, but when I wrote asking him for them, I could get none, and so on, and so on. It did his insight credit to recognise his master, but now his master has thrown him up as unworthy. For art one must give his skin, and learn to labour and wait.

But the public must be set right, or the petty vapourings and "clerkly personalities" may mislead.

As to the question of originality of "Naturalistic Photography," the photographic press and the chief photographers have allowed that. That certain vague ideas on Naturalism were current in the studios in certain circles I know, for I have the pleasure of the friendship or acquaintance of nearly every member of what is called the "modern school," and what they think of my originality and work, shall one day appear. It is not surprising to find the plagiarist who has lined his pockets with guineas taken for re-writing others' ideas—belittling that other. But to one who is thinking and working day and night at art, and has the knowledge, new ideas are not uncommon, and one day I shall offer a philosophy of art that will be, I venture to think, generally accepted and original; but that is a matter for ten or twelve years' more constant study and work. My plagiarist must not tell me I have no right to kill the goose that laid the golden eggs—it is too amusing.

The limitations of photography are all I have said—I regret it. I have been in correspondence with those able investigators, Hurter and Driffield (who have said if they are proved wrong they will withdraw ten years' work), and understand the matter thoroughly. I have confused nothing, the control of the values is most limited, and by development there is no control. I leave all scientific photographers to laugh at "the power to alter relative values by exposure, development, and other purely photographic means is infinite" (more "drivel")!

Mr. Davison's art knowledge is shown by the words, "What on earth has 'dexterity' to do with it?"—a little knowledge is really a dangerous thing.

It may take Mr. Davison more than a few weeks, doubtless, but then he can only dabble in art after office hours.

As to claims of "novelty for rough papers," I refer readers to the trash written by Mr. Davison on this subject in the "Photographic Art Journal," a few months ago. I tried rough paper some eight years ago, and the fact is recorded in "Naturalistic Photography." Others tried it before me, and Mr. Mostyn Clark made a series of elaborate experiments with printing papers some years ago. (Results exhibited at Pall Mall.)

I have no doubt certain members of the Camera Club of the Davison type felt my presence there a satire, and will feel more comfortable now they can pose undisputedly as authorities to those who are silly enough to heed them. But I seldom troubled that institution, although I was one of the original founders, which Mr. Davison was not.†

The pupil's opinion of his master's work is laughable and pitiable. Does he think he can ever grip what he thinks is "sadly wanting" in my photographs? I am sure he will never grip it—that requires hard work.

The worm turns and talks of competing with me. Being at times sportively inclined, I will set up a head in clay against my old pupil for £100, I will photo-etch a plate against him for £100, I will teach him how to print photogravure for £500; as for competing against his four pictures (my, what laughter his last "work" caused to some of us!)—well! well! my old wherryman Joey picked up a few crumbs of knowledge with me, and he talked one day of "taking a pictur' agin' me." Poor Davison is of the same blood as Joey.

Referring to the quotation from Mr. Davison's letter, I was willing (not anxious) to gratefully acknowledge Mr. Davison's words on behalf of "Naturalism," as I was willing to acknowledge everybody else who supported me.

Mr. Davison speaks of my "treating" with him to write for a journal I had in view. I may say I had a promised staff of artists stronger than that of any artistic journal in the world, but the capital to do the thing as we wanted was too great. I asked Mr. Davison (chiefly out of gratitude) to write a few historic memoirs for me, beginning with Sir J. Newton, the miniaturist. I felt I should like to find some work for my old disciple, and knowing Mr. Davison to be perfectly incapable of writing upon art or technical photography, I thought me of the "historic" corner.

\* Col. Noverre claims originality for degree of roughness used—this claim, so far as I know, is legitimate.

† The paragraphs here omitted are irrelevant.—ED. AM; PHOT.

It was a little work to dig out these matters, but too much work for this *plumeur*. If I were the editor of a responsible paper, Mr. Davison's art tattle should never appear.

I submitted the "expostulating" letter to Mr. Graham Balfour—a gentleman and a scholar—before I sent it. Mr. Balfour approved of it, and he has watched the development of "Naturalistic Photography" *ab initio*. He will, no doubt, tell Mr. Davison what he thinks of him when they next meet. I never "wheeled," or tried to wheedle anyone, and if Mr. Davison would keep his personalities to say face to face to me, I should know how to act.

The reference to the Society of Arts report of the "discussion" is a quibble. The emphasis given by my friend as to the origin and leadership of "Naturalistic Photography" was distinguished by its absence. The remarks referred to were made from headings of a speech previously prepared, and forthwith furnished to the Society. If your readers are not already bored, I could print them side by side, also the letter of "expostulation," which I am content should be seen by any gentleman.

Mr. Davison, to whom I gave a copy of "Pictures of East Anglican Life," wrote me a most effusive and grateful letter for it, praising the notes "To the Student"—alas, for human nature, that he should now talk of this deed as "advertising myself extensively"!

With that charming sense of delicacy and uprightness (!) which, together with modesty and gratitude (?), are such distinguishing traits in Mr. Davison's character, he has accused me of "vindictiveness," because I now find photography is limited. I have not even said I was going to give up photography. Whatever I do, my readers may rely upon this, that the upholding of truth (however unpleasant) will be my only desire.

Finally. A man who will stoop to commit literary theft will not hesitate to prove himself guilty of base ingratitude, malicious calumny, and deliberate falsehood. Mr. Davison's reply has proved him guilty of all these cowardly acts, and were the creature not too contemptible, he should receive his deserts in the law-courts. His "reply" will, doubtless, leave him as friends some kindred spirits, but few gentlemen, I suspect—in fact, his plagiarisms and manners at the Society of Arts decided some to cut him, and his reply has decided others.—Yours faithfully,

February 14th, 1891.

P. H. EMERSON.

\* \* \* \*

#### THE VIENNA EXHIBITION.

SIR,—Referring to the correspondence (Vienna Exhibition), we have not found our stringent rules (of which we had some misgivings) have in any way shut us out from receiving assistance from the best workers of the day, as we have over 200 exhibitors in all, over forty being from abroad, the placing at cost of the Association the foreign exhibits in temporary frames being appreciated by workers abroad. Everything points to an excellent exhibition.—Yours very truly,

T. S. MAYNE

Feb. 10th, 1891.

(Hon. Sec., Exhibition Committee.)

\* \* \* \*

#### WANTED LANTERN SLIDES.

SIR,—Will you allow me to appeal to your readers who are makers of lantern slides, for the gift of any spare ones they may have for the Eastern Counties' Asylum for Idiots at Colchester. I have personal knowledge of the delight the weekly lantern exhibitions afford to the afflicted inmates, and feel sure many will be willing to thus add to their pleasure. I need not say prize pictures are not solicited, but to indicate that many slides that would not pass muster at exhibitions will be available for this object. I shall be happy to receive and acknowledge any slides that may be sent for this purpose, although I am not connected with the institution. Unmounted prints will also be gratefully received.—I am, sir, yours truly,

GEO. W. BASKETT.

Albert Lodge, Colchester, February 6th, 1891.

\* \* \* \*

#### MARKING LANTERN SLIDES.

SIR,—Apropos of marking lantern slides by means of affixing white paper discs. I would suggest that a better plan is to paint the corners with Aspinall's white bath enamel; the index numbers of the slide can be written on the white paint with ordinary ink. The paper discs are liable to come off, the paint cannot.

I have also painted the bindings with various Aspinall colours which facilitates the sorting, each series having a distinctive colour or colours. But a word of warning—do not select your colours by daylight, as many perfectly distinct daylight colours cannot be distinguished in candle-light.

The paint is also a protection against damp.

SLIDES FOR CHILDREN.

Will anyone tell me what class of slides children like, *i.e.*, the low-class coloured slide such as rats running into a sleeper's mouth, or the better class slides such as animals, battle scenes, ships, etc., etc., from photographs. Of course, I do not mean the *fin de siècle* children, who, of course, would prefer astronomical diagrams and such like.—Yours truly,

E. F. BECHER

(Major, R.A.)

\* \* \* \*

#### FIRE INSURANCE FOR PHOTOGRAPHERS.

SIR,—Since reading your article in the *AMATEUR PHOTOGRAPHER* on the excessive rates charged by the larger Insurance Companies, I have taken considerable interest in the matter.

I have just effected a change of insurance myself, at a rate considerably less than formerly, and thinking, perhaps, something might be done for photographic insurance, I placed your article before the gentleman who secured for me a reduced rate, the results being, after considerable trouble, he has succeeded in obtaining a special rate for photographers that I am sure will meet with the approval of those who must be at present dissatisfied. I am now paying 3s. 6d. per cent., which I believe to be the lowest insurance rate on record for photographers.—Yours truly,

WILLEE.

February 11th, 1891.

NOTE.—Our correspondent does not state the office; perhaps he will do so in a subsequent letter.—ED. AM: PHOT:

\* \* \* \*

#### UNIFORMITY OF THICKNESS OF PLATES.

SIR,—Might I be allowed to suggest through your columns to our leading plate makers, that they adopt a more uniform thickness of glass in the manufacture of their quarter-plates? The increasing popularity of the hand-camera and consequent use of sheaths make this a matter much to be desired, for owing to the extent to which a box of plates vary in this respect, the filling of a dozen sheaths become a very vexatious and troublesome job, some plates, indeed, having to be thrown on one side as useless owing to their extreme thickness.

I am aware that there is on the market a plate of thin glass, but without taking into consideration the extra cost (which is certainly an item), there is open to it the grave objection of increased risk of breakage, both before and after the plate becomes a negative.

What is wanted for general use is not a plate of thin glass, but one of medium strength and uniform thickness. I think the greatly increased demand for plates suitable for hand-camera work, viz., the quarter-size of rapid series, quite justifies the request for the consideration of any little improvement that could be made in that particular make.—I am, yours truly,

FRED SMEDLEY.

\* \* \* \*

#### ARISTOTYPE PAPER.

SIR,—I have to thank Mr. E. J. Wall for pointing out an error (in theory at least) in my practice with this paper. I would, however, like to ask him why, in nearly all instructions, we are told to use alum to eliminate the last traces of hypo from negatives if its use be so deleterious as he states? Moreover, in practice I have not, so far as I am aware, lost or injured a single print from using alum. Of course, the seeds of decay may be in them and appear at any moment. I may also say that between the softness of the paper, tenderness of the film, and tendency to curl up in the washing waters, I found large-size Aristotype prints most difficult to handle till I used an alum bath. I do not put them direct from the hypo into the alum, but give a good wash in two or three changes of water, and then prolonged washing after. The alum hardens the surface and removes all tendency to curl. I will, however, in future, wash much more thoroughly previous to using the alum, but till I find prints distinctly injured, it is too useful to discard.—Yours, etc.,

GREENWOOD PIM.

# The Construction and Use of Photographic Lenses.

BY CLEMENT J. LEAPER, F.C.S.,

Instructor in Photography, City of Dublin Technical Schools.

## CHAPTER III. — (Continued.)

### THEORETICAL PRELIMINARIES.

IN the accompanying table of some of the varieties of glass made by Drs. Abbé and Schott, these data are given, together with the specific gravity of the same of glass and a concise description of it.

JENA OPTICAL GLASS.

Description	Refractive Index, for D line	Dispersion, C to F	Specific Gravity	Remarks
1. Light phosphatic crown	1.5159	0.00737	2.58	Colourless.
2. Dense barium phosphatic crown ...	1.5906	0.00922	3.66	Rather soft.
3. Boro silicate crown ...	1.5100	0.00797	2.47	Very hard and colourless.
4. Calcium silicate crown	1.5179	0.00860	2.49	Hard and colourless.
5. Soft silicate crown ...	1.5151	0.00910	2.55	Rather soft.
6. Boro flint ...	1.5503	0.00996	2.56	Affected by damp
7. Silico flint ...	1.6245	0.01743	3.68	Colourless.
8. Dense silico flint ...	1.7541	0.02743	4.78	"
9. Very dense silico flint	1.7782	0.02941	4.99	"
10. Extra dense "	1.9626	0.04882	6.33	"

On looking at the table it will be at once seen that the dispersions of two samples of glass do not vary in the same ratio as their refractive indices. Comparing, for instance, Nos. 1 and 3, it will be seen that whilst the refractive index of No. 1 is greater than that of No. 3, the dispersion of the latter exceeds that of the former.

The fact that dispersion is not proportional to refraction renders it possible to achromatise a combination of lenses, *i.e.*, to render them capable of transmitting white light as white light, and at the same time cause the rays to converge.

If, for instance, we make a convex lens of No. 1 glass in which the dispersion is practically  $\frac{1}{10}$  of the refraction, and cement it to a concave lens of No. 7 glass in which the dispersion is only  $\frac{1}{10}$  of the refraction, the latter would have to be made of only half the power of the former to give equal dispersion. And although by so altering it we reduce its refractive power as well as its dispersion, nevertheless what remains is still more than sufficient to neutralise that of the convex lens, and the combination will consequently be achromatic.

In other words, to correct chromatic aberration we must make the radii of the two lenses inversely proportional to the respective dispersive powers of the materials of which they are formed.

The mathematical expression for an achromatic pair of lenses is given by the equation—

$$\frac{a}{b} = \frac{c}{d}$$

in which  $a$  and  $b$  are the refracting powers of the two lenses, and  $c$  and  $d$  the dispersions of the different varieties of glass of which they are made.

If, for instance, we take No. 1 and No. 7 glass, then the ratios between the refractive powers of the two lenses for an achromatic combination will be  $\frac{0.00737}{0.01743}$

If, as is generally the case, we begin by assuming that one of the lenses shall have a certain focus, then it is easy to calculate what the focus of the correcting lens must be.

By combining this formula with that previously given for the correction of spherical aberration, we can see how a

lens free from chromatic and spherical aberration may be made from two given samples of glass.

Assuming, for instance, that we decide to use the first and seventh glass on the list, and that our concave flint lens must have a focus of six inches, then that of the convex crown will be  $\frac{6 \times 0.01743}{0.00737} = 14.2$  inches nearly.

This gives an achromatic combination, but we have still to correct for spherical aberration. Referring to the formula previously given, it will be seen that the values of  $a$  and  $b$  (refractive powers of the two lenses) are known to us, and our table gives us the values of  $c$  and  $d$  (refractive indices of the two materials). The only unknown quantities are then the four curvatures of the two lenses.

But, as in the construction of a lens, we always endeavour to have as few reflecting surfaces as possible, we agree to make one curve of each lens the same, *i.e.*, to make  $f = g$ . This leaves simply three unknown quantities, viz.,  $e$ ,  $h$ , and  $f$ , with the two following equations connecting them.

$$\begin{aligned} (c-1)(e-f) &= a \\ (d-1)(f-h) &= b, \end{aligned}$$

from which the values of  $e$ ,  $h$ , and  $f$  can be easily calculated.

(3) *Astigmatism*.—The above equation just given would, if worked out, give a lens the spherical aberration of which was corrected for rays falling axially or nearly so upon it; but if these rays fell obliquely upon the lens, it would be found impossible to bring them to a focus. This result is called astigmatism, and the existence of the defect is readily proved in the following manner.

Let a photographic lens of any type, and practically free from spherical aberration, be used to obtain an image of the sun on a sheet of cardboard. If the plane of the lens is parallel to the cardboard, and the solar rays approximately at right angles to either, it will be found quite easy to obtain a sharp image. But if the lens be inclined so that its plane makes an angle with the cardboard, it will be found impossible to obtain an image as sharp as before.

FIG. 4.

Fig. 4 sufficiently explains the reason of this. Let A B C represent the convex side of a lens. Then two parallel rays  $a b$ ,  $c d$ , symmetrically situated with respect to B will be refracted, and take the directions  $b e$ ,  $d f$ , also symmetrically with respect to A B, B O. But if the parallel rays took the direction  $m b$ ,  $n d$ , then the first would be refracted in  $b o$ , the latter in  $d p$ , directions no longer similar for the two faces of the lens. And as the condition of sharpness is that these rays should converge to one and the same point, it is clear that such a condition is fulfilled only when the plane of the lens is at right angles to the direction of the ray.

In practice astigmatism is reduced to a minimum by the use of the stop, which cuts off all rays which are very

oblique to the axis, and by making the curves of the lenses such that the incident and refracted rays make very small angles with the normals to the surface, in other words, the lens is made of as deep a curve as possible.

(4) *Curvature of the Field*.—When photographing a flat surface of any extent parallel to the plane of the lens the image of its central portions is received on the corresponding conjugate focal plane behind the lens, but since the distance from the margins of such a surface to the lens is greater than the distance from its centre to the lens, the conjugate focal plane on which the image of the margins is received should be nearer the lens than that upon which the image of the centre falls. For a similar reason the image of a point on the object nearer the lens than the centre, but further off than the margins, should be caused to form its image at a point behind the lens further off than that upon which the image of the centre is received, but nearer than that which receives the image of the margin.

It can be easily understood that, in consequence of this, to be perfectly sharp the image should be received upon a curved surface. This aberration, depending as it does upon the law of conjugate foci, is not due to spherical aberration; *i.e.*, a lens quite free from the latter might still give a sharp image over only a very small extent of surface.

Curvature of the field is corrected by the use of diaphragms, which act, as previously explained, by increasing the depth of definition, *i.e.*, the extent to which the ground-glass can be moved to and fro without materially affecting the focus.

(5) *Distortion*.—The cause of this has been already explained, and it has also been pointed out that it is usually corrected by placing a suitable diaphragm between two symmetrical lenses, in which case the convex distortion given by the back lens, with the diaphragm in front of it, is exactly corrected by the concave distortion given by the front lens, behind which the diaphragm is situated. So that, provided the lenses are accurately paired, these distortions being in opposite senses, exactly neutralise each other.

It by no means follows, however, that doublets only are free from distortion, for it is quite possible to substitute for the stop a diverging lens, or even by cementing three lenses together to produce a combination quite free from this defect.

(6) *Flare Spot*.—A lens possessing this defect will give negatives having a circular patch at the centre darker than the surrounding portions. The accompanying figure explains the reason of its occurrence. Let *a b c* represent a simple lens, with the diaphragm so placed in front of it that the

FIG. 5.

point *e* is outside the centre of curvature of the concave side of the lens. Then a portion of a ray *e b* will be refracted towards *b f*, and meet the principal axis at *g*. But another portion will be reflected from the inside of the convex surface *a f* towards *f g*, and again reflected towards *g p*, finally meeting the axis at a point *m*. What is true of a single ray will be true of the circular bundle of rays passing

through the diaphragm aperture, and these will in consequence form an enlarged image of the latter at *m*.

As this image can only be real, in the case in point, when the diaphragm is either at or beyond the centre of curvature, it follows that, to correct it, the diaphragm must be moved so that it is nearer the lens than the centre of curvature of the concave surface, in which case the image becomes virtual, and is not perceived.

The defect can then be corrected by either altering the position of the diaphragm with given degrees of curvature or by altering the degrees of curvatures of the two faces, the position of the diaphragm being fixed. For if, in the previous figure, the concave surface had been made sufficiently flat then it is clear that the ray *p m* would be rendered divergent instead of convergent.

(To be continued.)

## Instantaneous Photography.

By W. JEROME HARRISON, F.G.S.

### CHAPTER XI.

THE SENSITIVE PLATE UPON WHICH THE IMAGE IS TO BE IMPRESSED BY LIGHT.

III.—COMPOSITION OF THE SENSITIVE PLATE. THE VISCOUS MATERIAL BY WHICH THE SENSITIVE SUBSTANCE IS CAUSED TO ADHERE TO THE SUPPORT.

We have now considered (1) the support itself, composed at the present day almost invariably of either glass or celluloid; and (2) the substance sensitive to light, invariably silver bromide, sometimes having a little silver iodide mixed with it. We must next examine the manner in which the silver salt is caused to adhere or hold on to the support.

*Herschel Dispenses with a Viscous Material Altogether*.—Sir J. F. W. Herschel, who was the first to use glass plates as a support (in 1839), obtained a coating of silver chloride upon glass by placing the glass plates at the bottom of a vessel of water containing the silver chloride in suspension. The silver salt then settled down gradually upon the glass. But by this method only a thin and rather loose coating of the sensitive substance could be obtained, and it was very liable to fall or rub off. But, worse still, only faint images could be obtained on such plates, and to get even such images a very long exposure in the camera was necessary. For one thing, we see that, with the exception of the small amount of moisture present, there was nothing which could act as a sensitiser.

*No Special Adhesion Needed in the Daguerreotype or in the Calotype Processes*.—In the daguerreotype process a layer of silver iodide is formed upon a surface of silver—of which it is, indeed, a part—and there is no viscous or adhesive substance needed to hold the sensitive salts to its support. It is the same with Talbot's "Calotype" process. The silver iodide is formed upon and within the pores of the paper support, the paper itself being sized. One difficulty, indeed, with photography on paper, is to keep the image sufficiently upon the surface; for, owing to the pores of the paper soaking up or imbibing the sensitive substance, the picture is often more within than upon the paper.

*Albumen used by Niepce de St. Victor to Secure the Sensitive Material to the Support*.—Some aid to the theory that "genius runs in families" may be found in the case of the younger Niepce ("de St. Victor"), who was a relation—cousin or nephew, the French terms for relationship are somewhat puzzling—of he who has the most claims of any man to be styled the father of photography—Joseph Nicéphore Niepce, born 1765, died 1833.

The younger Niepce described his albumen process in 1847. Glass was coated with white of egg (which is a form of albumen), and silver iodide was then formed in the pores of the albumen. The plate, so coated, might be exposed while wet, or it might be dried and kept till wanted. This albumen process was improved by two other Frenchmen—Blanquart Evrard and Le Gray—and probably the finest transparencies ever made were produced in this way by the French firm of Ferrier and Soulier. But for ordinary negative work, the albumen process was terribly slow; ten to twenty minutes was the average exposure required. For *instantaneous* photography this beautiful method was clearly of no use. For lantern-slide making it has, however, been employed with great success.

Albumen is a complex nitrogenous substance. It coagulates when heated to 150 deg. F., or when treated with alcohol. About the year 1852 albumen was introduced as a coating for paper upon which silver prints were to be made; it kept the sensitive salt upon the surface (by filling up the pores of the paper), and its gloss, when dry, gave brilliancy to the print. Countless millions of eggs have been used for this purpose in photography; but since 1882 a liking for dull or matt-surface prints has sprung up, and it is probable that "albumenised paper" has "o'erpassed its halcyon days."

*Collodion as an Adhesive.*—Collodion is made by dissolving a form of gun-cotton in a mixture of ether and alcohol. It was discovered in 1847 by the American chemist, Maynard, and found its first application in surgery, being used to cover any part of the skin which it was desired to protect from the air.

When liquid collodion is poured upon glass the solvents soon evaporate, and a transparent, colourless film is left behind. In this film an English photographer, Frederick Scott Archer, saw (in the year 1851) the very substance needed to cause a substance sensitive to light—such as silver iodide—to adhere to the glass plate. Archer published the collodion process in the pages of a periodical called *The Chemist*, in March 1851. The collodion process quickly became popular, and was universally practised until 1880, when it was displaced by gelatine.

At first the collodion plates were always used *wet* and dripping with silver nitrate, which acted as a sensitiser. When the collodion plate was well washed (to remove this silver nitrate, which would otherwise have crystallised and so spoilt the film) and then dried, it was found to be very *insensitive* to light. This shows that *collodion itself* is not a sensitiser. But when such plates were treated, before drying, with various substances which would act as sensitisers—as pyro, tannin, etc.—the dried plates were more sensitive; though still less sensitive than wet collodion plates.

When collodion *emulsion* was introduced in 1864, the silver bromide displaced the silver iodide; but although the former was much more sensitive to light than the latter salt, it was still found necessary to add some substance, such as tannin, bitter beer, etc., to the emulsion to act as a sensitiser, since the collodion alone was unable to act in this capacity.

*Gelatine is both an Adhesive and a Sensitiser.*—Gelatine is obtained by boiling the parings of the skins, hoofs, etc., of animals. It is soluble in warm, but not in cold, water. Very large quantities of gelatine are made at Messrs. Nelson's works at Leamington; and Coignet's Gold Label (French) and Heinrich's (Swiss) gelatine are well-known brands. When repeatedly boiled, gelatine is changed into a gum-like substance called *meta-gelatine*, which is soluble in cold water. Gelatine keeps well in the dry but not in the moist or damp state.

Most of the early workers with gelatine—during the "seventies"—were wholly unable to appreciate the immense difference between the sensitiveness to light of silver bromide contained in collodion and the same substance embedded in gelatine. Recent researches have shown that it is possible for a gelatine plate to be three hundred times more rapid than a standard wet collodion plate; while, if the comparison be made with collodion *dry* plates, the advantage will be even more on the side of gelatine.

Why is this? It is because gelatine, instead of being a chemically inert substance like collodion, is a sensitiser as well as an adhesive. Not only does the gelatine envelop the particles of silver bromide, holding them firmly to their "support"—the glass plate—but it exercises an attraction for the bromine contained in the silver bromide, and thereby assists the light in effecting a complete or partial separation of the two elements—the silver from the bromine. As a simile, we may compare the components of the silver bromide to a brother and sister walking arm in arm; a robber (light) appears on the scene and attempts to part them, but they cling so closely together that he is unable to succeed, until his companion (gelatine) appears to lend him a helping hand!

(To be continued.)

## The Stereoscope.—XVII.

BY VALENTINE BLANCHARD.

It has already been shown that greater separation can be made between the pictures even with stereoscopes of ordinary make, and that larger pictures can, therefore, be made without seriously taxing their powers. With an eye-piece of short focus, however, this power is very much limited. For example, I have before me whilst I write, a pair of lenses fitted with cardboard so that they can be separated at will. The diameter of each lens is slightly over  $1\frac{1}{2}$  in., and the focal length 6 in. I have separated them exactly  $2\frac{3}{4}$  in. I find on looking at a slide slightly over 3 in. from centre to centre, there is, at the first moment of looking, a little difficulty in making the pictures coalesce, but by moving the lenses a little further apart, the stereoscopic effect is more readily attained. A difficulty in another direction, however, presents itself. The available portion of each lens is limited to  $\frac{3}{4}$  in., for beyond its axis the lens is useless for stereoscopic purposes. It follows, therefore, that when the lenses are separated so as to make them available for pictures with a separation greater than 3 in. from centre to centre, anyone looking through the lenses whose eyes happen to be abnormally close together, would use only the edges of the lenses, and the true stereoscopic effect would be obtained only after a considerable amount of straining of the eyes.

It may be well here to say, in order to prevent any misconception, that in speaking of focus the solar focus or burning image of the sun is at all times meant. The importance of this statement will be seen by any one who watches the amount of racking in and out necessary in order to adjust the stereoscope to requirements of different beholders.

After making a series of experiments with lenses of various focal lengths, and also of various diameters, I have come to the conclusion that whole lenses should not be less than 2 in. in diameter, and that  $2\frac{1}{2}$  in. would be really better; and that their focal length should not be less than 7 in., in order to produce the greatest amount of comfort to the eyes of the beholder.

To make these experiments of real value, I tried the

various lenses and semi-lenses on a considerable number of friends, and had in consequence eyes varying in focal power to experiment upon, so the conclusion arrived at is not due to merely personal observation. After repeated trials, first with whole lenses and then semi-lenses, an overwhelming majority were in favour of semi-lenses. Perhaps the reason is not far to seek. The smallest of the semi-lenses measured  $1\frac{1}{2}$  in. in diameter, and the largest  $1\frac{3}{4}$  in. Now, allowing for the waste of glass on the thin edges in order to square them, the disc out of which the smallest pair of lenses was cut could not have been less than 4 in. in diameter—probably more; and the larger pair were most likely cut from a disc of 5 in. Now, a little reflection will show that the smallest pair, even when mounted close together, had their axes separated 3 in., whilst the largest pair had them  $3\frac{1}{2}$  in. apart. It followed, therefore, that though the eyes most closely set together were fully provided for, the eyes abnormally wide apart could not by any possibility look beyond the axes of the lenses.

I have purposely dwelt at length on the stereoscope itself, for the experiments that have been necessary to make these chapters as complete as possible have taught me that in order to make the stereoscope once more popular greater care will be necessary even in the construction of the cheapest form of the instrument. An examination of a number of the American stereoscopes now regularly imported into England scarcely showed more than two with the eye-pieces sufficiently separated. Now, this is an error so easily avoided that one cannot help being astonished at its occurrence. In the matter of squaring up the semi-lenses with exactness, it is, perhaps, unreasonable to expect this to be perfectly done in an instrument that has travelled so far in order to be sold retail at less than two shillings. Of course, the *ideal* stereoscope cannot be expected at this price, and therefore we must wait patiently for its advent. How much it is needed has been shown to me during the progress of these chapters; for I had not at all realised how completely the stereoscope was unknown to the present generation until I proceeded to use the eyes of my friends for my experiments. Several young artists of mark saw through the instrument for the first time, and their exclamations were quite sufficient answers to the remarks that have been recently made that the views as seen through the stereoscope are altogether false and untrue to nature,—“Why, this is reality! It is nature itself,” and one for a moment forgets there is no colour!” “How powerless all the efforts of even the greatest painter appear after this!” and so on. It may be possible to deceive one eye by the transcript of nature on a flat surface, but never two—except in the stereoscope.

It will please many of the readers of these pages who desire the revival of this most wonderful instrument to know that a few months ago in the city of Copenhagen there was, and probably is now, an exhibition open daily devoted entirely to stereoscopic views. They were arranged in the form of tours, and were regularly advertised. From time to time the views were changed, and the change was duly notified in the papers. My informant, a Danish artist, saw a tour in Egypt when in Copenhagen a short time ago. As all good things must go abroad in order to acquire flavour, it is just possible that in good time we may see such an exhibition in London. The last time I saw anything resembling it was fifteen years ago at a country fair. The price for admission was one penny. In Copenhagen the price was about sixpence! Surely this shows high appreciation. Clearly there is hope for the stereoscope yet.

In conclusion, I cannot do better than give the words of one of the ablest workers for the advancement of photography written with all the enthusiasm occasioned by the

advent of the stereoscope. Professor Hunt, whose well-known work on photography was produced about the time of the first popular introduction of the stereoscope, immediately after the Great Exhibition of 1851, says, at the conclusion of his article on the stereoscope:—

“The magic result of the resolution of two plain pictures into one possessing to the eye the most positive solidity, is so striking when witnessed for the first time, that it appears a deception of the senses. Even when fully accustomed to the phenomena of the stereoscope, there is such an indescribable charm in the beautiful pictures that they are gazed on again and again with increasing admiration. Living forms appear to stand out in all the roundness of life; and where colours have been judiciously applied to the daguerreotype or calotype portrait, it is not possible to conceive a more perfect realisation of the human form than that which stands forth prominently from the background of the stereoscopic picture. Statues, in like manner, are almost realised again in their miniature representations. Architectural piles are seen in all that exactness of proportion and gradation of distance which is, in their minute reproduction, singularly interesting; and in landscapes, the stereoscope gives us a re-formation of every image in apparently the most perfect solidity and truth of distance. In the stereoscope we have at once an instrument which enables us to study many of the phenomena of vision, and to reproduce loved and beautiful objects or interesting scenes through the agency of those rays by which they were illuminated in that strange perfection which in its mimicry of visible external nature almost baffles the examination of the human sense.”

## Studies in Art for Photographers.

BY REV. F. C. LAMBERT, M.A.

### CHAPTER III.

WHILE the subject of lines and curves is fresh in mind, it may be as well to note one or two curious (and sometimes important) effects due chiefly to the direction of lines. For the purposes of this present chapter it is proposed to limit our observations to straight lines.

We have seen that approaching lines (*i.e.*, those which if produced would meet) have a general effect of conveying

FIG. 5.

the notion of opposition, balance, stability, *i.e.*, kindred impressions varying according to circumstances.

Now, observe that when two converging lines (fig. 5) A B, A C, enclose a considerable space, they have an effect upon other lines which happen to be enclosed within the angle; as, for instance, the four equal and parallel lines, *d*, *e*, *f*, *g*, appear to diminish in the order just mentioned.

Again, where we have a group of convergent lines intersecting other lines, we observe a somewhat similar effect. For instance, in fig. 6, we have a group of converging lines cutting the series of equal and parallel upright lines *a*, *b*, *c*, *d*, *e*. Note that the line *a* is cut into five parts, *b* into four parts, and so on. This seems to account in part for *a* appearing longer than *b*, and *b* longer than *c*, etc.

Another very well-known effect is produced by a series of convergent lines cutting two or more parallel lines. The series of short lines cutting two lines, A D, B E (fig. 7), have the effect of making A D and B E, appear to converge towards A and B; similarly B E and C F appear to converge towards E and F.

It is as well to bear in mind these various and somewhat delusive effects of converging lines, because they may very probably be of material assistance to the picture maker,

FIG. 6.

either in assisting him to produce a desired effect, or may at another time explain to him the cause of the difficulty he experiences in avoiding undesirable effect.

Before leaving the subject of parallel lines, it will be as well to take note of the effect produced by spaces chiefly occupied by parallel lines. In fig. 8 the space A appears longer than B, while B appears longer than C. On the other hand, C appears higher than B, etc. All three spaces are, of course, equal, although A and C appear not only unequal, but also of different proportions—an effect due to the direction of the lines occupying the spaces.

Again, with respect to relative size of spaces, it is important to notice that our first impressions (we are told to pay the chief attention to our impressions) depend on at least two different elements, viz., relative position and configuration.

This may be exemplified by fig. 9, where we have two irregular figures, A B. Now, at first glance they seem of different sizes, and also different shapes, but are, of course, equal in all respects. It is an interesting and useful experiment to cut out such figures. (Fold any sheet of light-coloured paper, and cut through both thicknesses at once, so getting two equal-sized pieces; the size and shape may be varied very considerably). Study the effect of placing them in various relative positions.

No doubt there are some readers who think this digression tiresome, and apart from the subject of pictorial composition, and yet I venture to ask for a patient consideration of these observations; because a knowledge of what is desirable is frequently contributed to by a knowledge of what is undesirable. What to retain, and what to reject,

FIG. 8.

more difficult to learn to reject than to retain. The temptation to the photographer is to overcrowd.

As excessive repletion tends to nausea, so overcrowding into a picture of conflicting elements tends to internecine war; wherefore let us all remember the old saw, "Enough is as good as a feast."

are the two pillars upon which the arch of composition must rest.

Furthermore it is often

## Photographic References.

BY MAJOR J. FORTUNÉ NOTT.

(Continued from page 96.)

### EXPOSURE.

To say that this question of exposure is a simple one to understand would be making a statement not justified by facts. Even if its application were limited to experienced photographers it would still be untrue. Any one who employs a camera either for business or pleasure is liable to err on this point every now and again, and extended experience can only lessen the risks of error without being able to prevent mistakes being made occasionally. When calculating the duration of time, under the circumstances which then exist, that should be accorded to the exposure, the photographer has to deal with one factor of a most uncertain quality, namely, the actinic power of the light which is temporarily prevailing. This may vary greatly during the same day without any very great change in the appearance of the weather becoming apparent. Some few hints on the matter which may be of use can be gleaned from books upon the subject; but there is only one correct plan to pursue, and that is to experiment for one's-self and to study in all their bearings any errors which may be made. In this way an experience is soon gained which, although, as before said, can never be infallible, will nevertheless be the very best, or we should say the only guide in which faith can be placed with any degree of certainty. Every photographer becomes therefore in this matter a law unto himself.

The brilliancy of the reflected image on the ground-glass screen, before and after the stop has been inserted in the lens, should be carefully examined and the estimated length of exposure gauged thereby. This is the very best method of getting a starting point for the calculation, mental or otherwise, which has to be made. This will not, of course, give the photographic value of the light, but the circumstances existing on the occasion will supply the missing information near enough for all practical purposes. The differences between the light over a brightly lighted landscape or seascape and that in a well-illuminated interior for the purposes of photography, are easily estimated. To start

from an assumed position—supposing the sensitiveness of the plate, the size of the stop to be used, and the nature of a light over an open landscape, would require one second's exposure, then under the same conditions a seascape with clear horizon would be one quarter of this time, while a scene having heavy foliage in the foreground throwing deep shadows over the place where the camera is situated, might necessitate ten times as long. With interiors there is very much greater latitude. Without they are exceptionally well lighted, it is almost impossible to over-expose them; the tendency is to rather under-expose than otherwise, owing to the patience of the photographer engaged in work of this character not being equal to the strain which giving one hour's exposure or more would place upon it.

The quality of the light during the different seasons of the year and during the variations in the weather common to each period must also be appreciated. This information can also only be acquired by experience and close observation. A bright day in winter will require two or three times as long exposure for the light to exert the same influence on the sensitive plate as the light on a day of similar character in summer. The hour of the day will also cause the time to vary and the light prevailing as a rule a little before sunset, although bright, being very yellow in its predominating tint, has an equally proportionate non-actinic value.

The student is strongly advised to give from the very outset of his photographic career particular attention to this vital matter of exposure, for upon the manner in which he utilised his experience under the varying conditions in which he has worked will depend to a great extent the character of the photographs he produces. The best advice we consider it possible to give when he first begins to employ his camera is this: Get a box of sound, reliable plates made by some well-known manufacturer, and expose them under different conditions of light, hours of the day, and with the lens working with different-sized stops. If careful notes are taken during these experiments, a foundation for that knowledge regarding this subject which is indispensable to a photographer, has been made, and will in every way repay the trifling outlay which it necessitated. Of course, small plates can be used, but the larger they are the better, for several reasons, the most important one being that the various phases of development can be easier seen by the tyro than would be the case if the plate was of very limited proportions. When once the correct exposure has been made, a certain confidence will be established, which will materially assist in guiding the judgment on all subsequent occasions.

As soon as some facility in calculating the duration of the exposure has been acquired, the other circumstances which affect the subject in a minor way can be noted. For instance, the direction of the wind is a matter of some consequence, for if an east wind be the prevailing one, for some reason or another the actinic value of the light suffers a certain diminution. The nature of the clouds, if there are any, and the hue of the sky, have also elements which are worthy of attention. The temperature of the atmosphere is another point which experienced photographers have learnt to consider as of some importance, and the predominating colour of the principal objects in the view is not a point that should be overlooked. The advice to always expose for the shadows is a good one, and so, also, it is a good plan to err rather upon the side of over-exposure than upon under-exposure, for the effects of the one are more easily overcome in the developing room than the other.

It is always well to avoid changing the make of plate to which the photographer has become accustomed; but if circumstances necessitate more or less sensitive ones being employed, the exposure based upon the experience acquired can

be utilised by ascertaining the sensitometer numbers from the maker, and in this way getting the difference in sensitiveness between the two emulsions, and making the necessary allowance. Too much reliance must not, however, be placed upon the readings of the sensitometer as given out by plate manufacturers; they are only of service in making rough guesses at the way in which the plates should be treated. For any other purpose in which greater accuracy is essential, the tests should be made by the operator himself.

A small memorandum book should always be kept in which a record of each exposure is made, together with some information about the light, the nature of the scene, the character of the lens, and the size of the diaphragm, and after the negatives have been developed the kind of result obtained should be stated. When once the habit has been acquired of noting these circumstances no trouble is experienced in keeping such memoranda up to date and in a sufficiently accurate manner to create a book of reference for subsequent consultation which will be of the utmost value in guiding the judgment when difficulties are encountered. Many lessons of a practical character can also be learnt therefrom which can be obtained in no other way, for in several points regarding this subject of exposure practice is opposed to theory.

(To be continued.)

## A Rapid Hydroquinone Developer.

HERR LAINER contributes to *Photographische Correspondenz* some valuable notes on the use of hydroquinone as a developer, which are the results of a series of exhaustive experiments carried out in the usual thorough manner characteristic of all Germans. Herr Lainer incidentally remarks that the addition of yellow prussiate of potash to the pyro and soda developer is certainly to be recommended, and that dense and vigorous negatives can be obtained by the use of this salt, especially with instantaneous exposures. Herr Himly specially recommended the use of this salt with hydroquinone as a means of obtaining density and greater contrast, without the restraining action of bromide. Herr Lainer gives the following formula as one of great reducing power and rapidity:—

### FORMULA No. 1.

#### Solution A.

Hydroquinone	..	..	10 grammes.
Sodium sulphite (neutral)	..	..	25 "
Distilled water	..	..	600 cc.m.

#### Solution B.

Caustic potash (KOH)	..	..	50 grammes.
Distilled water	..	..	100 cc.m.

For a half-plate, mix 60 c.c.m. of Solution A with 3 c.c.m. of Solution B. "This developer developed a sensitometer plate in  $\frac{3}{4}$  minute to 24 deg. Warnerke, with absolute clearness of the negatives. The image appears in about 3 seconds. But not every kind of plate will permit the use of this developer, since many kinds of plates give a grey fog—an observation also made by Eder and Lenhard." The addition of yellow prussiate of potash to the developer gave clear negatives even with those plates which otherwise gave fog, and the following are suggested as the most suitable proportions:—

### FORMULA No. 2.

#### Solution A.

Hydroquinone	..	..	10 grammes.
Potash ferrocyanide	..	..	120 "
Sodium sulphite	..	..	40 "
Distilled water	..	..	900 c.c.m.

*Solution B.*

Caustic potash (KOH)	..	..	50 grammes.
Distilled water	..	..	100 c.cm.

For a half-plate, mix 60 c.cm. of Solution A and 6 c.cm. of Solution B. The image appears in about 3 seconds, and development is complete in 30 to 45 seconds. . . . This developer permits a shorter exposure, brings out the details well in the shadows, and permits of a very quick development.

The use of soda instead of potash gives negatives of a softer character, and the following is an excellent formula :—

## FORMULA No. 3.

*Solution A.*

Hydroquinone	..	..	10 grammes.
Sodium sulphite	..	..	30 "
Potash ferrocyanide	..	..	90 "
Distilled water	..	..	950 c.cm.

*Solution B.*

Caustic soda (NaOH)	..	..	30 grammes.
Distilled water	..	..	90 c.cm.

For a half-plate, mix 60 c.cm. of A and 12 c.cm. of B. For portraiture a somewhat slower working developer is advisable, when the following is excellent :—

## FORMULA No. 4.

*Solution A.*

Hydroquinone	..	..	10 grammes.
Sodium sulphite	..	..	35 "
Potash ferrocyanide	..	..	25 "
Distilled water	..	..	1,000 c.cm.

*Solution B.*

Caustic potash	..	..	50 grammes.
Distilled water	..	..	100 c.cm.

*Solution C.*

Caustic soda	..	..	30 grammes.
Distilled water	..	..	90 c.cm.

For a half-plate, mix Solution A 60 c.cm. with 6 to 9 c.cm. of Solution B, or 10 to 12 c.cm. of Solution C. The image appears in 5 seconds, and is completely developed in 1 to 2 minutes. For convenience in travelling, the following may be used :—

## FORMULA No. 5.

*Solution A.*

Sodium sulphite	..	..	25 to 30 grammes.
Hot distilled water	..	..	100 c.cm.
Hydroquinone	..	..	10 grammes.

Dissolve also—

Potash ferrocyanide	..	..	25 grammes.
Distilled water	..	..	100 c.cm.

and mix.

*Solution B.*

Caustic potash	..	..	50 grammes.
Distilled water	..	..	100 c.cm.

*Solution C.*

Caustic soda	..	..	30 grammes.
Distilled water	..	..	90 c.cm.

For use for a half-plate, mix Solution A, 10 c.cm.; Solution B, 6 to 8 c.cm.; and water, 40 c.cm.; or Solution A, 10 c.cm.; Solution C 10 c.cm.; water, 40 c.cm.

## THE ACTION OF IODINE IN THE HYDROQUINONE AND EIKONOGEN DEVELOPERS.

The following interesting and useful application of iodine in the developer is given by Herr Lainer :—For the following experiments I used a solution of 1 gramme of iodine in 50 c.cm. of spirit, and diluted it with 50 c.cm. of water. 3 to 6 drops of this 1 per cent. solution of iodine, when added

to 30 to 40 c.cm. of hydroquinone developer, acts in a very striking manner. The appearance of the image is, indeed, very much accelerated, the image appears almost instantaneously in all its details, and becomes vigorous only with longer developing, the contrasts are lessened, and, with an illumination poor in contrast or flat working plates, a flattening of the image takes place. As an addition to hard-working hydroquinone developers, the addition of 1 to 3 or 4 drops of the above iodine tincture has proved excellent, and one attains by this means a very beautiful gradation of half-tones; whilst a greater addition equalised the tones, a decrease of the sensitiveness was not observed. Four drops of the iodine tincture in 40 c.cm. of eikonogen developer do not act very strikingly. With and without addition of iodine, 25 deg. W. were obtained with three minutes' development; the addition of iodine, however, increased the clearness of the plates and acted favourably on the gradation; even 10 drops of solution of iodine resulted in no flattening, still, the density of the first numbers was markedly lessened. Iodine tincture in small quantities acts in the eikonogen developer similarly as with the hydroquinone developer, if also not in so vigorous a manner. An acceleration of development is not obtained by the addition of iodine; rather the opposite, since the development must be prolonged to obtain great density.

We have, therefore, in the addition of iodine or iodide of potassium, a very valuable means of being able to act on the character of the negative during the development with oxalate, eikonogen, or pyrogallol. Since one uses a 10 per cent. solution of bromide of potash in order to obtain greater density or more contrast, one obtains with the addition of iodine the opposite effect, and that in varying degrees according to the amount of addition, and also, which is very important, without prejudice to the sensitiveness of the plate.

## Hydroquinone as a Developer.

M. REEB, in a recent communication to the Société Française, gave some novel and valuable scientific information on the action of hydroquinone in connection with sodium sulphite as a developer. We can only give a summary of the paper, and the deductions M. Reeb draws from the same. Hydroquinone possesses great affinity for oxygen, especially in the presence of an alkali or alkaline carbonate, and oxidation is instantaneous in the presence of certain bodies capable of yielding nascent oxygen, such as oxide of silver, the silver being reduced to the metallic state. This reducing action is lower when the silver is combined with any acid, but slowest of all when such acid is a mineral acid. In the presence of an alkali capable of neutralising the acid, however, the reduction is regular and complete. The addition of an alkali accelerates to such an extent the process of oxidation that hydroquinone soon loses its reducing property, this being prevented by the addition of a so-called preservative such as sodium sulphite. By the harmonious combination of these three substances, hydroquinone, alkali, and sodium sulphite, it is possible to produce a perfect developer. To determine this combination, the following three points were examined experimentally—

(1) Determination of the reducing power of hydroquinone.

(2) Determination of the quantities of alkalies and of their carbonates, corresponding to a given quantity of hydroquinone.

(3) Determination of the quantity of sodium sulphite necessary for the perfect working of the developer.

The first determination was experimentally proved, and the result was that 0.08 grammes of hydroquinone completely reduced one gramme of silver nitrate.

The action of sulphite, it was proved, if not greatly in excess, does not prevent the complete reduction of the silver salt to the metallic state. On the other hand, if sodium sulphite be used in excess, the precipitation of the metallic silver is retarded (this is a point we have insisted upon for some considerable time), and the deposit is whitened.

The determination of the second point is very easy, and the following table represents the equivalent quantities of alkalies to be used in combination with 0.08 grammes of hydroquinone for the complete reduction of 1 gramme of silver nitrate.

Potassium hydrate (caustic potash)	0.33 gramme.
Sodium " (caustic soda) ..	0.2353 "
Potassium carbonate .. ..	0.4064 "
Sodium carbonate .. ..	0.8411 "

The determination of the third point is deduced from experiments conducted with a solution founded upon results 1 and 2, thus:—

Hydroquinone .. ..	0.08 gramme.
Potassium hydrate .. ..	0.33 "

Increasing quantities of sodium sulphite were added to this, and the results carefully watched, and M. Reeb gives the following deduction as the result. The proportion of sulphite does not depend only on the quantity of hydroquinone, but first on the ratio between the hydroquinone and its alkali, and afterwards on the choice of this alkali. He adopts the following as two suitable developers:—

Hydroquinone .. ..	1 gramme.
Potassium hydrate .. ..	4 grammes.
Sodium sulphite .. ..	7.5 "

When an alkaline carbonate is used, less sulphite is required.

Hydroquinone .. ..	1 gramme.
Sodium carbonate .. ..	10.5 grammes.
Sodium sulphite .. ..	5 "

The final deductions from these experiments is summarised briefly as follows. The following table represents the most suitable proportions for a developer.

Nitrate of silver, 1 gm.	Hydroquinone '08	Potassium hydrate ...	.33 gm.	Sodium sulphite, '60 gm.
		Sodium " ...	.2353 "	
		Sodium carbonate ...	.8415 gm.	Sodium sulphite, '40 gm.
		Potassium " ...	.4064 "	
Distilled water, sufficient quantity.				

An alkaline (caustic) will be more energetic than a carbonate, and therefore for instantaneous exposures the former is to be preferred, for time saves the latter.

### JACOBY'S CHLORIDE OF SILVER EMULSION PAPER.

MR. OTTO SCHOLZIG, of 31, Binfield Road, Clapham Road, S.W., has taken up the sole agency of the above paper, and has forwarded us samples and instructions. We have given the paper an extensive trial during the last few days of printing weather, and can very highly commend the results which are to be obtained on it. The directions issued with the paper are complete and carefully compiled, and will doubtless prevent many inexperienced operators from making a mess of it. By the introduction of this paper and the use of a particular bath, we have been enabled to obtain a true sepia tone, such as was only hitherto attainable by the use of the carbon process. To the erstwhile disciple of the now defunct impressionist school, this paper will be a veritable boon, and to the lover of warm-toned artistic matt prints we strongly recommend it, as fine detail, warm tones from lemon-yellow to deep chocolate-black, can be obtained at will, and some of our prints with a matt surface are finer than anything we have yet seen in this respect. The supporting paper is of good tough quality, and we have found it less liable, therefore, to tear, etc., in the manipulations; and finally, but not the least important, the support is free from any tint, being pure white, and this will be the only colour stocked, though pink may be obtained to order.

## Notes for Novices.

### THE DIAPHRAGM.

A DEFINITION we once heard given of the term diaphragm was perhaps true if not scientifically correct, and unfortunately that definition too often represents about the extent of the knowledge of the novice about the diaphragm or stop. The explanation was as follows: "The diaphragm is a bit of brass with a hole in it, used to stop out the light and bother photographers." We can remember a time when this was about the extent of our knowledge, so we must try and make this matter plain to novices, and induce a more intelligent use of the diaphragm.

We must first of all state that the term "stop," so often used as synonymous with "diaphragm," is not correct; in general optics the terms are used indiscriminately, but in photographic optics "a stop" is always placed in contact with a lens, whilst "a diaphragm" is some distance from it. We have already considered that part of our subject which deals with "the ratio aperture of the diaphragm," and given instructions how to determine this. We shall now consider the effect of the diaphragm on the image, and as lenses are divided into two classes—(1) single, view or landscape, and (2) doublet, portrait, group, or rectilinear lenses—we must consider the relation of the diaphragm to each lens separately.

#### (1) SINGLE, VIEW OR LANDSCAPE LENSES.

The diaphragm plays an important part in influencing the character transmitted by the single lens in two different ways: (a) by its position, (b) by its size. The influence of "position" is seen in the character of the distortion, the equality of illumination, and the presence or absence of "flare spot;" the influence of "size" is felt in the increase or decrease of exposure, in definition, and depth of focus.

A single or landscape lens cannot be used without a diaphragm, and the correct position is found by the optician. Supposing, however, we place our diaphragm in contact with the lens and make a stop of it, we actually reduce the diameter of the lens to a central patch and the image is found to be sharp in the centre only, the field is very much curved, so much so that curved plates would be a necessity, but there would be no distortion. Now let us remove the diaphragm a little distance in front of the lens, from one-quarter to one-seventh of the focal length; we shall find that our central patch of good definition gradually extends till we are prevented from moving the diaphragm any further because we get contraction of the angle of view, or amount of subject included is lessened and we get barrel-shaped distortion. Now we have seen that placing the diaphragm in contact with the lens gives a very curved field but no distortion, and that the further we remove our diaphragm, the flatter the field and the greater the distortion; it is obvious, therefore, that the best position of the diaphragm is that point which will give us the flattest field with the least distortion, therefore the nearer the diaphragm is to the lens with a good flat field, the better the lens.

The second point is equality of illumination. It must be clearly understood that the light admitted to the centre of the picture or plate is the greatest, whilst that admitted to the margins of the plate is considerably less. This can be very easily understood when we consider that as the rays of light fall more obliquely upon the stop the light is less and less, and also that necessarily the focal length of the marginal pencils is increased when the distance from the diaphragm to the margins of the plate and from the diaphragm to the centre of the plate is measured. The decrease of illumination has been accurately calculated by the late Mr. J. H. Dallmeyer, who gives the following results, which, for convenience, we have put in a tabular form. Let us suppose that the amount of light received by the centre of the plate = 100. Then—

When the angle included is 40 deg., the marginal illumination = 80 deg.	
" " " 50 " " " = 70 "	
" " " 60 " " " = 55 "	
" " " 70 " " " = 45 "	

Therefore the wider the angle, or, in other words, the shorter the focal length, of the lens for a given sized plate, the more unequal the illumination of the centre and the margins of the picture.

"Flare" and "flare-spot" is caused by reflection from the surfaces of the lens, and is usually an image of the aperture of the diaphragm, which may be remedied by alteration of the position

of the diaphragm one-eighth of an inch either way, or sometimes by merely blackening the edges of the aperture itself.

We shall continue our notes on this subject, but at present have reached the limit assigned to us.

**Price, Talbot, and Co., Ltd.** are now selling off a large assortment of photographic goods under cost price; amongst the items to be obtained are quarter-plate and 5 by 4 cameras, with changing backs, at twenty shillings, and half-plate, with changing backs, for thirty shillings. Any amateurs desirous of purchasing apparatus would do well to pay Messrs. Price, Talbot, and Co. a visit.

**Sized Papers.**—Now that so many workers are salting and sensitising their own paper, the following method of determining the nature of the size used on the paper may be of use:—Resin size is evenly distributed in the entire mass of the sheet of paper. Animal size forms two layers entirely separated from each other by the body of the paper. Hence, if the paper is well rubbed and bruised, any characters traced upon it penetrate through if an animal size has been used.

**Prout's Glue.**—A correspondent writes:—"Seeing a paragraph in the *AMATEUR PHOTOGRAPHER* of January 16th, by a brother who had repaired a developing dish with this article, I resolved to try it, with the result that I have nearly cleared my 'hospital' of what I began to think were incurables, and have brought them again into active service. Most workers have broken frames, dishes, etc., to repair, and they would do well to try it. It is in sticks, from 1d. each (much like bottle wax), and melts easily over candle or gas. Care must be taken, however, not to burn it. Directions given with each piece."

**Borax.**—Borax is found, amongst other places, at Saline Valley, on the Eastern slope of the Sierra Nevada Mountains, eleven miles from the line of the Carson and Colorado Railroad Company, and its topographical aspect is best described by comparing it to an immense oval saucer. The crude borax there covers the plain, which is eighteen miles long by twelve miles wide, for an area of over one thousand acres with a depth of from six to eighteen inches. The colour of the crude material as it lies upon the plain is of a peculiar greyish yellow; the borax is mixed with sand, sulphate of soda, carbonate of soda, and salt. The material varies in richness from 10—90 per cent. of borax, the formation being a conglomeration of sand and small crystals of a loose and friable nature.—*Chem. News.*

**An Opportunity.**—The following extract from the *Colonies and India* opens up a new field for photographers, and photographs of the ruins mentioned would be of considerable interest, not only to the antiquarian but to the anthropologist. We commend it to the attention of those of our readers who will be going into the neighbourhood for their holiday:—"Mr. H. B. Sterndale, who passed to and fro among the Pacific Islands with an observant eye a few years ago, has lately been making public the result of his researches among the Cyclopean remains to be found in various parts of the Polynesian archipelagoes. Ponapé, where the Spaniards are now busy carrying on a war of extermination against the unfortunate natives, has long been known to travellers in that region for its curious relics of an earlier civilisation, and evidences of the remains discovered upon Easter Island some years ago are at the present time to be seen in the rude statues which stand at the entrance to the British Museum. Mr. Sterndale appears to have gone still further afield, and in the island of Lele he made some interesting discoveries. Lele is situated in 98° south latitude and 160° east longitude, and is described as a volcanic island, with an extinct volcano scarped and walled to the summit. Here is to be found a wilderness of ruined castles, the walls in some cases 12 ft. thick and from 30 to 40 ft. in height. They are in the form of parallelograms, 200 ft. by 100 ft. for the most part, but some are described as being very much larger. Many of the buildings appear to have been erected upon artificial islets, which are surrounded by canals lined with stone. The theory put forward by Mr. Sterndale is that early Hindoos reached not only Polynesia, but Central America, and he points to the use by the Polynesians of the word *meru* for paradise, and the word *dewa* for spirit, as distinct evidence in support of his contention. Even from the comparatively few archaeological discoveries so far made among the Pacific Islands, there is an abundance of evidence to show that there must be a wide and interesting field for investigation in that part of the world. A great deal of scientific sorting out has been done among the Incan ruins in Peru, and those of the Aztecs in Central America, and perhaps it is due to the insular and scattered position of the various countries spread over the face of the Pacific that we as yet know so little of their peoples and their histories. But while our friends at the Antipodes are busying themselves over Quixotic expeditions to the antarctic regions, it seems somewhat surprising that no organised attempt has yet been made for the examination of the many interesting relics which undoubtedly exist in several parts of the now easily accessible neighbouring islands of Polynesia.

## Quarterly Examinations in Photography.

**Question 10.**—What are the leading factors which regulate the duration of exposure?

**ANSWER.**—The chief factors regulating the length of an exposure are:—

- (1) The nature of the subject to be photographed—its lighting, colour, distance, etc.
- (2) The state of the weather.
- (3) The time of day.
- (4) The time of year.
- (5) The ratio of the diameter of the stop employed to the focal length of the lens.
- (6) The sensitiveness of the plate used.
- (7) If the object photographed is in motion, the rate at which it is moving.

WORFIELD.

**Question 11.**—Is there any difference between wet-plate and dry-plate development? If so, what?

**ANSWER.**—Yes, there is a good deal of difference.

In wet-plate processes, the sensitiser being free nitrate of silver, the image is built up on the face of the film from the free nitrate of silver absorbed by the developer which is deposited on the light-formed compound by the reducing action of the ferrous salt, the restrainer being acetic acid.

is the equation.

In the dry-plate process, the whole of the available silver being contained in the film, the image is formed by the reduction of the silver sub-bromide to a greater or less depth depending on the extent to which light has acted.

Abney says, however, that if silver nitrate be added to the developer a dry plate could be developed by the same method as a wet.

R. C. M.

**Question 12.**—Describe the use and action of a swing-back?

**ANSWER.**—The swing-back is useful in almost every branch of photography, particularly in architectural and landscape work. In architectural photography we generally find it necessary to tilt the camera in an upward position. This naturally causes the vertical lines to converge at the top, but by keeping the swing-back in a perfectly vertical position this evil is remedied. In landscape work we find that to bring the foreground and distance both into focus at the same time, we have to use a small stop, thus losing brilliancy; but by moving the top of the swing-back in an outward direction we are enabled to bring both planes into focus without the disadvantage of using a small diaphragm. The swing-back is also used in the same manner in portraiture and other branches of photography. In theory it is as follows:—The nearer an object from which the rays proceed is to the lens, the longer will be the focus after they pass through the lens; therefore, the rays proceeding from a distant object have a shorter focus than those proceeding from a nearer one. It is, therefore, plainly evident that by swinging the back of the camera, we can bring the plate to the focus of both rays at the same time.—*SUNESIS.*

Answers have been received from, and marks awarded to: A. C. S., Worfield, Lindum, R. C. M., Electra, Biarritz, Sunesis, Developoid, E. B., C., Spain.

A handy little desk Calendar is that sent us by Messrs. McGhie and Co., of Glasgow. It is tastefully got up, and can be either hung upon the wall or made to stand on the table.

The Woodburytype Co., of 157, Great Portland Street, have sent us a copy of a very fine reproduction of Sant's beautiful picture "The Soul's Awakening." It is a marvellous piece of work, and being in carbon is practically permanent. All lovers of Sant's pictures should secure a copy of the print, which is published at 10s. 6d.

The proprietors of the *Photographic Times* (New York) have forwarded to us a very handsome framed Calendar embellished by glimpses of old-time life, which are quite refreshing in these go-ahead days. The method of indicating the day of the month is simple but very effective, and the whole work will form an ornament to any room in which it is placed.

We have received from Mr. Dunmore some specimens of his new kind of Cloud Negatives, which he recommends for general work. The cloud forms are on translucent paper, of very thin texture, and, therefore, the negatives can be printed from either side, a point of considerable convenience. The negatives are reasonable in price and will meet a want.

## Notes from the Liverpool Centre.

(By our District Editor.)

LAST Saturday's annual dinner of the Liverpool Association was a marked success in all departments. The President filled the chair, being supported by Mr. William Tomkinson in the vice-chair, Messrs. T. S. Mayne, Illingworth, Stanistreet, Tunstall, and nearly all the more prominent workers in the Society. During the evening the party was photographed by the flash-light process, Messrs. A. F. Anyon, R. Crowe, and E. M. Tunstall manipulating the apparatus. An experiment, in the shape of having oxy-hydrogen lights at one side of the room to soften down the shadows in the picture, was tried by Mr. Anyon, and, I hear, with very good results. Mr. Wm. Tomkinson and Mr. J. Woolfall, who had the arrangements for the dinner in hand, are to be commended for the unqualified success of the function.

As a matter of local information, I may say that the printed report of the Liverpool Association for the year ending November, 1890, is to hand. It is a substantial pamphlet of thirty pages, and contains much matter of interest. The total strength of the Society is given as 277, including an executive of nineteen officers. Sub-committees number four. Financially, the Society is sound, and shows satisfactory balances. The library embraces about sixty volumes of standard works on photography, besides a large number of serials, annuals, pamphlets, etc. Upwards of thirty meetings, excursions, etc., were held during the year, not including the weekly coffee and other informal gatherings. From January to November inclusive, nearly sixty new members were added to the Society.

With a promptitude scarcely to be expected from officials in a department of Her Majesty's Government, the authorities at the Hydrographical Department of the Admiralty have returned to the Liverpool President the Iceland papers thrown into the North Atlantic Ocean, and subsequently recovered, particulars of which I gave last week. A letter of thanks has also been sent, with an intimation that the facts of the "recovery" are highly interesting and of great value.

Naturally, the exhibition occupies all the interest and spare time of our most active members. The preliminary arrangements are making good progress, and things all round are most auspicious. To date, the number of individual exhibitors present a large increase on that of the 1888 show. On Tuesday a deputation composed of Messrs. Paul Lange, William Tomkinson, and T. S. Mayne had an interview with the Committee of the Arts Section of the Liverpool Corporation to obtain more space in the Walker Gallery rooms. Their efforts were successful, though every inch of the extra space conceded will be required. The Hanging Committee have no light task in placing and cataloguing some 1,500 frames.

On Monday night Mr. Tomkinson gave his "Normandy" lecture at Wavertree, showing 160 slides from his collection taken during an autumn holiday in 1889. There was a large and enthusiastic audience, the lecture room, which holds several hundreds, being packed. The chair was occupied by Mr. John Blythe, one of the most successful of Liverpool's merchants, who expressed his delight and pleasure with the entertainment. Messrs. Archer and Sons worked the lantern arrangements in unusually fine style with their new dissolving lantern and rolling curtain effect, the most perfect I have yet seen. Mr. Tomkinson "christened" his lecture "Adventures of Messrs. Camera, Tripod, and Snapshot; members of the Black Art Club," a name which conjured well and opened the way for many racy jokes.

## Notes from the Edinburgh Centre.

(By our District Editor.)

A CIRCULAR has been issued by the Council of the Edinburgh Photographic Society, to the guarantors of the late Photographic Exhibition in Edinburgh, calling up 25 per cent. of the guarantee fund. The amount of the deficit has not been stated yet, but will probably be communicated to the members of the Society at their next meeting, in the beginning of March.

A litigation has been in progress in Leith Small Debt Court, over a washer for photographic purposes, which, though involving a small amount in money, has given no end of trouble. There is in Leith a small club of ten members, calling themselves the

Leith Photographic Lantern Club, and some time ago they authorised Mr. J. J. Guthrie, one of their number, to get made for them a zinc washer for gun-cotton. Mr. Guthrie is a draughtsman, and in placing his order he gave a sketch of the article which was wanted. When delivered to him, the washer, he said, was not made according to the sketch, and he also objected to the price which was charged for it. The washer was, by order of the Sheriff, examined by a plumber, who, on Tuesday of last week, reported that in his opinion it was made according to the sketch. Evidence was then led as to the circumstances connected with the transaction, after which the Sheriff gave decree as concluded for, with expenses. The case is a warning to amateurs who wish to produce something out of the common—that it is necessary to bind the tradesman down to a definite agreement, and not to trust to his word, because if he misunderstands his instructions he is likely to want the customer to pay for his mistake.

The Royal Scottish Academy Exhibition of the works of living artists, which is an annual spring institution in Edinburgh, was opened last Saturday, in the galleries in which the Photographic Exhibition was recently held. There is a large and a very fair collection of pictures, so far as a hasty glance can show. What is of more consequence, it is quite evident that, no matter how much artists may affect to despise the work of the camera, they are not above taking very substantial aid from it in the outlining of their pictures.

## Societies' Meetings.

**NOTE.**—In this column the Editor can of necessity only give a brief summary of the proceedings. Papers read before societies will appear in the PHOTOGRAPHIC REPORTER, and the Editor of the REPORTER will be glad to receive reports for insertion as early as possible after the meetings have been held.

**Birmingham.**—The above Society held a lantern evening on Wednesday the 11th inst. The exhibits included slides kindly lent by Messrs. J. B. B. Wellington, Fry and Co., Sands and Hunter, etc. It was announced that the first meeting at the Midland Institute would be held on the 26th inst., when papers on "Shutters" and "Instantaneous Photography" would be given.

**Bradford.**—A meeting was held on the 12th inst., the President (the Rev. T. Mellodey) being in the chair. Mr. Alexander Keighley gave a paper on "Artistic Photography." The lecturer divided his subject on the composition of pictures into the following heads:—(1) Absence of perfect symmetry; (2) Balance of objects; (3) Completeness; (4) Harmony; (5) Breadth of effect; (6) Balance of lines; and (7) Contrast of lines. Each of these heads was dealt with in an exhaustive manner by Mr. Keighley, and sketches and photographs made by the lecturer, as well as photographs by others, were shown to illustrate his remarks. A new detective camera, called the "Pearl," was shown by Mr. George Roberts, and much admired for its completeness and simplicity.

**Brighton.**—At the annual meeting on the 10th inst., Mr. Slingsby Roberts in the chair, the report and balance-sheet were adopted, and the rules were amended, the number of Vice-Presidents being increased to three. The subscription for members resident within the Parliamentary borough of Brighton was increased to 10s. per annum, and for country members to 5s., with an entrance fee of 2s. 6d. The officers for the year were elected as follows:—President, Mr. J. P. Slingsby Roberts; Vice-Presidents, Messrs. Caush, Rean, and Warne; Treasurer, Mr. D. E. Caush; Secretary, Mr. A. H. C. Corder; Committee, Messrs. Bedford, Ford, Graham, Hardcastle, Tate, Webbling, Wicks, and Williamson. The Secretary announced that the prints sent in for competition had been adjudicated upon by Mr. H. P. Robinson, and his awards were: Class II., for the best set of six prints taken during the year 1890: silver medal, "Meta" (Mr. E. J. Bedford); bronze, "Neva" (Mr. A. H. Webbling); ten entries. Class III., for the best set of three prints taken on the excursions: silver, "Dabbler" (Mr. F. Tate); bronze, "Atlas" (Mr. E. J. Bedford); nine entries. Class IV., for the best set of six prints taken on the Brightonian plates: a Taylor's half-plate RR. lens, Mr. E. J. Bedford (4 entries). There was a good show of members' work, fine enlargements being contributed by Messrs. Roberts and Graham; platinotype views in Tasmania, by Mr. H. D. Warne; platinotype views in North Wales, and a 12 by 10 enlargement from a quarter-plate, by Mr. Corder; land-scapes, groups, etc., by Messrs. Bedford and Emery. The exhibition was very successful.

**Bristol.**—On the 13th inst. an ordinary meeting of the Camera Society was held at the University College, when there was a good attendance. In the absence of the President, the Secretary was

voted to the chair. A very interesting demonstration of the "Kallitype Process" was given by Mr. Lavington, assisted by Mr. Baker. A number of prints taken from hand-camera exposures were developed, and the simplicity and economy of the process were much admired. The results were considered to closely resemble platino-type and to be a formidable rival to bromide.

**Bolton.**—On the 11th inst. a very interesting demonstration on "Enlarging on Bromide Paper" was given by Mr. T. Parkinson, sen. From a half-plate negative of the President, Mr. J. Johnston, M.D., a very excellent  $3\frac{1}{2}$  transparency had been made by daylight on a wet collodion plate. An ordinary Ilford plate was used in making the negative  $3\frac{1}{2}$  size, and developed with ferrous oxalate. This negative was then put in the Siopticon lantern, the lens in which was considerably stopped down, and after giving about ten minutes' exposure on a 15 by 12 paper, was developed with ferrous oxalate, beginning with an old solution first and strengthening after with new solution. A fairly satisfactory result followed. A longer exposure would have been better, as slow Eastman's paper was used. Altogether a very pleasant and instructive evening was spent.

**Cardiff.**—An ordinary meeting was held on the 13th inst., Mr. C. F. Gooch in the chair, Messrs. E. J. Howell and Dugald Latty were elected ordinary members. Matters appertaining to the approaching exhibition were fully discussed, and the classes arranged. In addition to the survey of Glamorganshire section, an important feature will be a competition open to the societies of the British empire for a series of lantern slides illustrating any town or district. The prize will be a high-class optical lantern. Ms. Gambier Bolton, F.Z.S., will shortly visit Cardiff, and favour the Society with his interesting lecture on "Animal Photography."

**Carlisle.**—A very successful exhibition of lantern slides was given in the Market Hall, Scotch Street, on the 10th inst. The slides shown were the prize sets which gained the AMATEUR PHOTOGRAPHER Prize Medals in 1890, numbering 160 slides, comprising landscape, seascape, figure, and architecture, and were excellent examples of all the qualities which go to make good lantern transparencies. Accompanying each set was a slide of the worker who had produced them.

**Croydon.**—At the meeting on the 16th inst., the President in the chair, Mr. J. F. Fielder and Mr. S. P. Phillips were elected members. The dinner to celebrate the first anniversary of the foundation of the Club will be held at the Greyhound Hotel on Monday, March 9th, at 8 p.m. Members desiring tickets are requested to make early application to Mr. White. "The Book of the Lantern," by T. C. Hepworth, was presented to the library by the President. About 200 members' slides were passed through the lantern, the most noteworthy being some exceptionally fine microscopic photographs taken by means of polarised light, by Mr. C. F. Oakley.

**Darlington.**—The usual monthly meeting was held on the 11th inst. In the absence of the President, Mr. E. Ensor presided over a good attendance. The American slides were thrown on the screen by means of a powerful lantern, and were much enjoyed. The annual conversation and exhibition is to be held in the Mechanics' Hall on February 27th.

**Dundee.**—The meeting on the 12th inst., Mr. J. D. Cox, President, in the chair, being a lantern evening, was an open one. The members and their friends were shown a large number of slides illustrating Brittany, made by Mr. A. R. Dresser. The general excellence was high and a great many deservedly applauded. Several of Griffiths' hand-cameras were sent for exhibition, and seemed excellent value for the moderate price. Two of the cameras had been tested before the meeting and found to give exceedingly good results.

**Glenalmond.**—At the first business meeting of the term, held on the 6th inst., the following new officers were elected:—President, Arthur S. Reid, M.A., F.G.S.; Secretary, C. F. Scobell; Treasurer, H. Cunningham Craig. The following new members were enrolled: Dr. D. Welsh, M.D., B.Sc.; Messrs. J. Shiell, H. de Putron, and C. ap R. Pryce.

**Hackney.**—On the 12th inst. Mr. Henry Sturmev gave a very interesting and amusing lecture on "Norway," before a very large attendance of the members. He described his trip there fully. Many of the slides shown were exceedingly pretty, and some were rather humorous. About one hundred slides were put through the lantern, and Messrs. Dean, Gosling, Barton, and Herbert Smith showed slides. The Society now is just on the century as far as members go.

**Haltwhistle.**—A special meeting was held on the 9th inst. for the purpose of exhibiting the AMATEUR PHOTOGRAPHER 1890 Prize Competition slides. There was a large attendance of members and their friends. The President (Mr. Joicey) occupied the chair, Dr. Spiers read the description of the slides, and the Secretary manipulated the oxy-hydrogen lantern. The audience were very highly gratified; the genre and architectural classes were most appreciated.

**Harlesden and Willesden.**—A meeting was held on the 10th inst., Mr. J. Naylor, President, in the chair. Mr. Goshawk gave a demonstration upon "Retouching." The Society have decided to shortly give a lantern and musical entertainment.

**Huddersfield.**—The above Society held its ordinary meeting on the 10th inst., the President, Surgeon-Major Foster, in the chair, when the American slides were put through the lantern and thoroughly enjoyed by an appreciative audience.

**Ikeston.**—This Society gave its first lantern exhibition on the 13th inst., in the Independent schoolroom, before a crowded audience representing the leading families of the place. Dr. Carroll, the President of the Society, was in the chair. The "American Slides" were exhibited by Mr. Geo. Woolliscroft (Treasurer), by means of his powerful oxy-hydrogen lantern, the description being given by Mr. W. Shakspeare (Hon. Sec.) The slides were greatly admired, as well as some local slides by Messrs. Woolliscroft and Shakspeare. The exhibition was so successful that it is intended to hold another one before long.

**Ireland.**—The annual general meeting was held on the 13th inst., Professor J. Alfred Scott, M.B., Vice-President, in the chair. The report of Council and Treasurer's statement of accounts were read, and showed the Society to be both numerically and financially in a flourishing condition. After the necessary business in connection with the election of officers and council for the ensuing year had been transacted, a number of slides of pictures in Switzerland, the work of Dr. Cosgrave and Mr. Greenwood Pim, were passed through the lantern, and explained by the latter gentlemen.

**Isle of Thanet.**—In the presence of a large audience, at the Parish Hall, Broad Street, the members of this young but energetic Society gave a competitive exhibition of lantern slides on the 12th inst. The slides were principally illustrative of scenery of the Isle of Thanet, but, by the introduction of views of foreign places, and some microscopic slides, considerable variety was obtained, and the audience spent an exceedingly pleasant as well as instructive evening. First were shown some reproductions of famous paintings and engravings, the slides being kindly lent by Mr. Tweedie, of Margate, and then a number of local views by Messrs. G. F. Blower, E. Deacon, F. Deacon, T. J. Dutton, and others. The former gentleman's views of Ramsgate by day and by night (the latter showing extensive illuminations) were exceptionally good. Mr. F. Deacon's "Pegwell Bay Frozen" (two views) were cleverly done and effectively shown, and Mr. E. Deacon's various sea pieces came in for a great deal of highly deserved approbation. In the picturesque neighbourhood of King's Lynn, Mr. Dutton had made some very pretty photographs, which, as shown on the sheet, were much appreciated by the audience. Other noticeable features were Mr. F. Deacon's views of Sturry, and Mr. E. Deacon's effective picture called "Fire," disclosing the local volunteers evidently in the midst of the horrors of war. Amongst the other noteworthy photographs were Canterbury Cathedral interior by Mr. H. G. Holloway, jun., Quex Chapel by Mr. Blower, and some capital Continental pieces by Mr. J. Roe, B.A., and the Vicar, who is the President of the Society and who throughout the evening explained the various views. Some beautiful microscopic slides by Mr. Vigar were also shown and came in for considerable admiration. The chief event of the evening was the announcement of the result of the competition amongst members of the Society. The Editor of the AMATEUR PHOTOGRAPHER was the judge, the names of the competitors being unknown to him, the specimens being sent in under *noms de plume*. The Vicar read a letter from the judge, who announced that he had passed the whole of the specimen slides through a lantern and awarded prizes as follows:—1st, Mr. G. F. Blower; 2nd, Mr. F. Deacon; 3rd, Mr. Edgar Deacon. The Committee's own prize was won by the Rev. C. E. Eastgate. Upon the result being declared, the names of the winners were very warmly applauded. Subsequently the prize photographs were thrown on the sheet, those by Messrs. Blower, F. Deacon, and E. Deacon showing great merit and being particularly admired. Mr. Blower's best piece, "Home, sweet Home" was splendidly done. The slides sent in by unsuccessful competitors were also shown, and of these the contributions of Messrs. H. Jarratt, A. D. Sackett, and Pearce gave evidence of considerable care and skill. Selections of music were given at intervals.

**Kendal.**—The monthly meeting was held on the 11th inst., Mr. F. Wilson in the chair. In addition to a good attendance of members a number of visitors were attracted by the special business, which consisted of viewing and adjudicating on a series of lantern slides sent for competition by the members. These consisted of sets of six. The awards were for the best set and for the best single slide. Twelve members competed, and the slides, as a whole, were considered superior to those of previous years. In both the sets and single slides the running was very near. Mr. C. E. Greenhall obtained first place for the best set, and Mr. G. Gilkes the first place for the best single slide. The prize slides of the AMATEUR PHOTOGRAPHER Lantern Slide Competition 1890, numbering over 170, were shown, and particulars of each slide, regarding exposure, plate, developer, etc., were given. The exhibition is a highly instructive one for amateur photographers, and one which they appeared to greatly prize and appreciate. Regret was felt that more time could not have been spent over it.

**Lantern Society.**—At the meeting on the 9th inst., Mr. J. Traill Taylor read a paper on "Lenses and Condensers for Lantern Work." Mr. Taylor commenced by saying that in his remarks on condensers the light was assumed to be small and intense. At present there was no perfect condenser on the market, and the subject was one that might profitably be worked out further than it had yet been. Mr. E. M. Nelson was the only Englishman who had as yet tackled the subject. In America they had given much more attention to the matter. The back lens of a condenser should be fairly large, so as to include as wide an angle as possible, and as thin as possible on account of the heat, the edges being ground thin for the same reason. The effective diameter of the back lens was considerably less than the diameter of the lens itself, and in the ordinary commercial condenser the margin of the lens to the extent of about half an inch inwards was not utilised. Mr. Taylor showed a drawing of a theoretically perfect condenser to transmit absolutely parallel rays from a small luminant. It was of triple form, and five inches in diameter. He also described Professor Morton's triple condenser, which included an angle of 93 degrees, and he gave the curves for both these condensers. In a perfect lantern the third lens of the condenser (the one farthest from the light) should be removable and of different focal lengths. The first two lenses would be arranged to give parallel rays, which could then be converged more or less according to the purpose for which they were to be used by the third lens. With reference to lenses, Mr. Taylor said that the Petzval portrait lens was the best form, and explained how the flatness of field could be improved by increasing the negative aberration of the back lens. In the discussion which followed, Mr. G. R. Baker referred to the focal lengths of lantern condensers, and Mr. E. M. Nelson mentioned Professor Abbé's theorem that the intensity of the light at different distances from the condensers varied as the square of the sine of half the angle included.

**Manchester.**—The monthly meeting was held on the 12th inst., when a paper on "Astronomical Photography" was read by Mr. Samuel Okell. The first attempts were on daguerreotype plates, the subject being the moon, but it was not until after the introduction of collodion that Warren De La Rue obtained successful pictures. His efforts were followed by others, but the climax of lunar photography has been attained in America, under Mr. Commons, by the great Lick telescope, which takes direct lunar pictures six inches in diameter. The sun, which is now photographed in the one-hundred-thousandth part of a second, was photographed at the time of eclipse in July, 1851. Mr. De La Rue followed, and was successful in showing the red protuberances, and Mr. Alfred Brothers, of Manchester, was successful in 1870 in securing photographs at Syracuse of the solar corona in a manner not previously attained. His method has since been generally adopted. After reviewing the progress in the interval, Mr. Okell mentioned that in 1882 a splendid comet was photographed in the southern heavens by Mr. Gill, and the result, when sent to London, excited the wonder of astronomers, for not only was the comet shown, but a background of stars also, and faint ones down to the ninth magnitude were shown even through the comet's tail. Mr. Commons remarked that this photograph "came as a revelation of the power of photography," and others welcomed it as a new-found power. Scientific men were soon engaged in various parts of the world, and by 1885 the old method of charting the stars had disappeared and photography had taken its place. The old charting had accurately placed 324,198 stars, but the telescope, aided by photography, which discovers stars before invisible to the eye, shows some twenty millions of stars in the entire heavens. Not only is the star photograph more accurate than any observation, but the degree of brightness by which astronomers classify the stars is accurately recorded, for a star of any given order emits just  $2\frac{1}{2}$  times as much light as the next magnitude below it, and one of the 16th magnitude is, therefore, a million times fainter than one of the first. Mr. Okell then spoke of the photographing of nebulae and clusters, and concluded a most interesting lecture by showing on the screen, by means of the optical lantern, a striking series of solar, lunar, and stellar photographs. At a later stage of the meeting the Chairman drew attention to the reported discovery of the long-wished-for photography in colours, reading a portion of the communication to the *Daily News* from Paris. Mr. Brothers said he had seen the report in the papers, and as the method of the French philosopher was indicated pretty fully in the article, he had that day made some experiments by photographing in the way indicated, some strips of stained glass. He had got no colour, but plenty of fog. Other speakers followed, all of whom expressed entire disbelief in the alleged discovery.

**Pudsey.**—A meeting held on the 12th inst. resulted in the formation of a new Society under the above title. Twelve members gave in their names, and there is every prospect of soon having a strong membership. A hearty invitation is given to all interested to attend the next meeting on the 24th inst., at which a splendid lantern and numerous slides will be in requisition.

**Richmond.**—At the meeting on the 13th inst. there was a good

muster of members. Mr. Cembrano presided. The promised demonstration of the "Collodio-Bromide Process" by Mr. Hussey, was unavoidably postponed till next week, in consequence of that gentleman's indisposition, and a discussion on "Exposure and Exposure Tables" was substituted. Most of those present contributed to the discussion, from the tyro who confessed that he had no ideas on the subject which could be of the smallest use to any one else, to the veteran of wet-plate days who looked upon exposure tables much as a man looks upon swimming corks who has learnt swimming without them. The longest exposure on record was stated to be one of several months, given to a dry collodion plate in the Catacombs, while the shortest went into thousands of a second. Two new members were elected.

**Rotherham.**—The second annual exhibition was held on the 10th inst., in the St. George's Hall, Rotherham, and proved exceedingly successful. On the three sides of the concert-room specimens of work, executed in platinum, argentic bromide, Obernetter, and other processes, were displayed, considerable judgment having been exercised with regard to the arrangement. Conspicuous among the frames were a fine collection lent by the Sheffield Photographic Society, which from the first has shown a warm interest in the welfare of its near neighbour. The local examples of the photographic art were a testimony to the progress made in so brief a period, and it was generally very commendable. The Treasurer (Mr. J. Leadbeater) had a number of photo-micrographs of a large size on exhibition. Later in the evening a number of members' slides were projected on the screen by means of the Treasurer's biennial limelight lantern. This part of the proceedings was much enjoyed. At intervals selections of music were given.

**Stockton.**—The ordinary meeting was held on the 10th inst., Dr. Stainthorpe (President) in the chair. The first of a series of monthly competitions was held, the subject being "A Lantern Slide." Eleven competitors entered, and Mr. Woolman was declared to have received the largest number of marks. The AMATEUR PHOTOGRAPHER Monthly Competition prints "River and Seascape Scenery" were on view, together with the Prize Stereo Slides; both sets were very much admired, particularly the stereo views by Captain de Crespigny, whose mounts had a very fine effect. Are they to be procured in England? If so, where? The Secretary (Mr. Ellam Yarn) would be much obliged for the information. Four new members were elected and five proposed.

**The Photographic Society.**—The annual meeting was held in the new rooms, 50, Great Russell Street, Bloomsbury, W.C., on the 10th inst., the President (Mr. J. Glaisher, F.R.S.) in the chair. In opening the proceedings the President congratulated the Society on possessing a home of its own. Captain Mantell, R.E., the Hon. Secretary, then read the report of the Council. Twelve papers had been read during the year, and the exhibition had been on the whole satisfactory. The scheme for the formation of a Photographic Institute had made some progress. All the metropolitan and Provincial photographic societies had been communicated with and invited to give their opinion upon a report that had been circulated amongst them. In moving the adoption of the report, Mr. E. Mackie drew attention to the unsatisfactory nature of the technical meetings, and asked whether steps could not be taken to improve them. He also thought that the Council should be larger, so that it might contain more representative men. Mr. T. E. Freshwater also referred to the matter of the technical meetings, and the President promised that the Council would take the matter under its consideration. Mr. W. S. Bird, the Treasurer, then read his financial statement, in the course of which he said that the membership had increased considerably during the past year. He thought it might be advisable to endeavour to affiliate all existing photographic associations with the parent society. Mr. A. Mackie enquired whether the rumoured photographic exhibition would not injure the Society's exhibition, and expressed his opinion that the expenses connected with the journal ought to be curtailed. Mr. L. M. Biden thought that more lantern nights should be given at the exhibition, and considered that the Journal should be improved and illustrated. In moving a vote of thanks to the President, Mr. Sebastian Davis said he could not help thinking that their present prosperity was due to the assiduity, the energy, and the experience of Mr. Glaisher. He had been connected with the Society for twenty-three years, and was therefore able to speak of the zeal and ability which the President threw into everything with which he was connected. He might say that it had been the warmest desire of the President for many years that they should have a home of its own. The President, in reply, referred to the past history of the society, and remarked that there was plenty of room for the extension of the operations of the society, and suggested the giving of lectures on various subjects. A discussion then arose upon the Journal, Mr. W. E. Debenham saying that he would like to see the Journal illustrated like some of the German periodicals. Mr. L. W. Biden asked whether it would not be possible to confederate the various photographic societies throughout all England, and asked permission to convene a

meeting of delegates from the various societies in the society's rooms. The Hon. Sec. stated that the Assistant Secretary would endeavour to put the technical meetings upon a more satisfactory footing. Mr. R. Robinson suggested that it was desirable that an attempt should be made to obtain all the old medal pictures, as they would form an interesting collection, illustrative of the progress of photographic art. The Hon. Sec. said that Mr. Warnerke had undertaken to give a lecture on an extra meeting night, and it was hoped that this lecture would be followed by others. Mr. L. Warnerke said that in undertaking to give this lecture at a special meeting he hoped that it would be a kind of introduction to what would probably take place if the Institute should be founded. After some further conversation about the technical meetings and the library, the proceedings terminated. The result of the election was as follows:—President: J. Glaisher, F.R.S., F.R.A.S. Vice-Presidents: Capt. W. de W. Abney, C.B., R.E., F.R.S., T. Sebastian Davis, F.C.S., H. P. Robinson, J. Spiller, F.C.S., F.I.C. Council: W. Ackland, G. L. Addenbrooke, W. Bedford, V. Blanchard, F. Cobb, A. Cowan, T. R. Dallmeyer, Major L. Darwin, R.E., G. Davison, W. E. Debenham, W. England, J. Gale, F. Hollyer, F. Ince, G. Lindsay Johnson, M.B., H. Chapman Jones, F.C.S., F.I.C., Capt. A. M. Mantell, R.E., J. W. Swan, M.A., F.C.S., J. Traill Taylor, L. Warnerke, Sir H. Trueman Wood, M.A.

**Toynbee.**—At a meeting held on the 10th inst., samples of the Barnet dry-plates kindly sent by Messrs. Elliott and Co. were distributed among the members. The specimen print sent with the plates seems to show that they were specially adapted for rapid work. A sample of Dr. M. Andresen's eikonogen developer was kindly sent by Messrs. Marion and Co. The developer is supplied mixed ready for use and packed in cartridge-shaped cases; it simply requires dissolving in water. For tourists nothing could be more desirable. The developer gave very great satisfaction to the members who used it during the evening.

**Tunbridge Wells.**—The ordinary monthly meeting was held on the 12th inst., the President (Mr. F. G. Smart) in the chair. The correspondence was read, which included a communication from the Photographic Society of Great Britain, in reference to the proposed Photographic Institute, but it was considered that the Association was not in a position to assist financially, and it appeared to be more for the professional than the amateur worker. And with regard to the National Photographic Exhibition to be held at the Crystal Palace in April, members were not inclined to join in the competition for the challenge cup, as professionals were competing in other societies. The bronze medal given by Sir David Salomons, Bart., and the AMATEUR PHOTOGRAPHER Silver medal were much admired. The lantern entertainment which was organised to assist in covering the loss sustained by the bad weather during the exhibition, was a decided success, and materially lowered the deficit, which was still further reduced by the generosity of the patron, Sir David Salomons, Bart., and the President, Mr. F. G. Smart. The Hon. Secretary laid on the table copies of "Scraps," and one of Dr. Andresen's eikonogen cartridges, which is a special form of carrying a developer when travelling; also a description of a new hand-camera, "The Radial," brought out by Messrs. Marion, and forwarded by them. Mr. Cassingham brought several novelties—Adams' lantern-slide frame, an ingenious contrivance for printing lantern-slides by contact from any size negative; Cameron's tripod-screw and plumb-bob combined; an American pattern stereoscope; Tylar's print-hangers. But the principal item of interest was a stereoscopic hand-camera, holding twenty-four half-plates, without sheaths or backing of any kind, and by an ingenious arrangement any one of the twenty-four plates could be exposed at will. The camera was fitted with a pair of Wray's lenses, Thornton-Pickard shutter, and by removing sliding front and partition it could be used as an ordinary half-plate camera: any less from 4 in. to 7 in. focus could be used on it. Another special advantage over nearly all other hand-cameras was in being able to focus exactly the same as an ordinary camera on a screen inside, so that there was no guesswork as to the amount of subject included, or as to its being in correct focus. A collection of stereo-transparencies taken with the camera were passed round for inspection, and were much admired. Mr. F. W. Burton was thanked for his kindness in giving a landscape picture painted by himself, as a first prize in the landscape class at the last exhibition.

**West London.**—An ordinary meeting was held on the 13th inst. The President announced receipt of a circular from the Crystal Palace authorities of the rules and classes for the forthcoming Photographic Exhibition, and thought the Society might enter for the challenge cup. A circular from the Photographic Society of Great Britain, asking for the opinion of the members as to a Photographic Institute, was handed round, but discussion was deferred until members had had an opportunity of studying it. The President then announced that he had forwarded a circular, *re* cheap riding fares to photographers, to forty-nine London and suburban photographic societies for their consideration, and requesting them to fill up same, with number of members, and to lay it before their

next meeting, and say whether their names might be added to the memorial which was to be lodged with the several London railways. A favourable answer had already been received from two societies. The question from the question box, which was held over from the previous meeting, as to whether ammonia fumes injuriously affected the lungs, was answered by Dr. Low, who said that, considering the extent to which the ammonia was diluted before use in the developing bath, he did not think any harm could be caused to the lungs, but it might, perhaps, have an effect on the eyes. The President then introduced Mr. Wm. Schooling, F.R.A.S., to the meeting, who gave a very interesting lecture on the "Application of Photography to Astronomy," illustrated with slides from photographs taken at the Harvard and other large observatories. Mr. Schooling said that photography had not helped them much with regard to the detail on the surface of the moon and the spots on the sun; in fact, more truthful effects were got with sketches; but that with regard to distant stars, some of them were rendered with great exactitude on the photographic plate when not visible to the eye through the most powerful telescope in use. Mr. Whiting thought that astronomers might, with advantage, turn their attention to the discovering of some emulsion which would give a less coarse image than that given by gelatine, and suggested slower plates, and thought that at the present time albumen would be the best thing to use. Mr. Schooling said that, owing to the movement of the planets, it was necessary to use as rapid a plate as possible. A cordial vote of thanks to the lecturer terminated the proceedings. The next meeting, a lantern evening, will take place on the 27th inst.

**Wolverhampton.**—The monthly meeting was held on the 10th inst. The President, T. Ironmonger, Esq., occupied the chair. A letter was read from the Photographic Society of Great Britain respecting a proposed Photographic Institute. The matter was left in the hands of the Secretary. Mr. Lee, jun., was admitted a member of the society. It was decided to hold the annual meeting on March 24th, at which a resolution will be submitted respecting the alteration of rules, with the object of throwing the society open to amateur and professional photographers. Mr. J. Gale gave an interesting lecture on "Ainsworth's Boscobel," illustrated with lantern slides. The lecturer described the places of interest connected with the battle of Worcester and Charles II.'s wanderings after the loss of the battle. Slides of White Ladies Abbey, Hobbie Grange, Madeley, Evelith, Boscobel, Moseley Old Hall, etc., were thrown upon the screen, these being a few of the places visited by Charles II. during his flight to the coast. A few slides were put through the lantern, made by Mr. Charles Ironmonger, which he had sent from Melbourne, showing a few of the public buildings in that city.

**Portfolio Club.**—Mr. W. H. Whittard writes:—"I am desirous of joining a portfolio club for the interchange of prints, etc., and thought if you would kindly insert this letter in your next issue, it would be the most speedy means of bringing me into communication with some club which has a vacancy." Letters can be sent to Mr. Whittard, care of the Editor.

**Photographing the Larynx.**—Dr. R. Wagner has been successful in obtaining some excellent photographs of the human larynx, 9 by 12 mm. in size, by means of a magnesium lamp and the ordinary laryngoscope, the camera and lens being fixed behind the aperture of the mirror. This is by no means the first time this feat has been accomplished, however.

**Mounting Glazed Prints.**—A correspondent writes: "Having seen several inquiries and statements in your paper recently as to the best method of mounting gelatino-chloride prints, the following, which I have lately hit upon, may be of use to other amateurs, and, therefore, I send it for insertion, should you think it worth doing so. It is simply to coat the edges of the print one-eighth of an inch all round with Le Page's liquid glue, and press it on to the mount, to which it adheres with great tenacity; being colourless and requiring no heating, it does not cockle or affect the print in any way, which lies perfectly flat and retains its fine gloss. It also sticks at once, but not too rapidly, to allow the print to be adjusted on the mount."

**Mercuriography.**—M. Villon has just discovered a new application of mercury and its salts to photogravure, which is likely to be of value to the artist and photo-mechanical printer, and it is founded on the facts that (1) mercury possesses the property of attacking all metals except iron and platinum, and forms amalgams with the same; and (2) that the amalgamated places of a metal plate will not take a fatty ink. The mercury is used either in the form of an ink with brush and pen, or can be made up into crayons, and thus used to draw at once upon the zinc. The full directions are far too copious to reproduce here, but the process is applicable to every one of the photo-mechanical processes in which a metal plate is used as the matrix. It is also applicable for etching, gilding, and silvering glass.

## To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance, the number and full title of the query referred to.

## QUERIES.

**4511. Hydroquinone, Concentrated Formula Wanted.**—I have been using a hydroquinone developer sold by Wood and Co., Strand, and found it most excellent. Can any one give me a formula to make it? Its advantage is in being so much more concentrated than any formula I have yet seen, 60 minims of each of the two solutions being enough for the normal developer for half-plate. I want, if not that one, at any rate a concentrated quinol developer, and one that will keep well.—**BROWN.**

**4512. Coating Waste Plates.**—Will any one tell me how I can simply coat my wasted plates to produce positive transparencies? I have tried gelatine salted and then sensitised in silver bath, but the result is miserably poor. How is this? Why will they not print as well as on paper, and how must I amend the process to obtain successful results without resort to development?—**PUZZLED.**

**4513. Reblacking Diaphragms.**—By constant wear my diaphragms are worn bright, which causes a flare. Would some kind reader inform me how I can reblack same?—**BERKSHIRE.**

**4514. Shutter for Detective Camera.**—Can any one tell me the make of shutter to go inside detective camera for half-plate, to be fitted about one inch from the film, using Eastman's roll holder? It must have regulation for instantaneous exposures.—**PHILIPS.**

**4515. Photographing on the Continent.**—Can any of your readers give me trustworthy information from recent personal experience as to facilities for, or hindrances in the way of photographing in any of the following towns or their neighbourhood: Ostend, Bruges, Zurich, Innsbruck, Triente, Verona, Venice, Riva, Milan, Como, Menaggio, Lugano, Bellinzona, Lucerne, Strasburg, Ghent? I do not care for any second-hand or merely general information.—**L. M.**

**4516. Lens and Camera.**—Would some one kindly tell me which is considered the best and most useful lens (half-plate) for all kinds of work, and the maker's name? Also of a good and cheap half-plate camera?—**L. N. H.**

**4517. Relief Seals from Photographic Negatives.**—I have seen described a mode of preparing relief seals from photographic negatives by means of bi-chromated gelatine which is made to swell up and then hardened so as to allow of a plaster cast being taken from which an electrotype copy forming a seal is made. Can any correspondent (1) give a reference to any paper or book which contains the description required, or (2) himself describe such a method?—**HENRY WILES.**

**4518. Photographic Apparatus for India.**—Enquirer, who is about to go out to Assam, India, for a number of years, would feel greatly obliged for any advice concerning the choice of a set of photographic apparatus—particularly as regards the construction of camera, slides, and tripod—suitable for the climate, ratio of exposures as compared with those made here, purchase of photographic materials, etc.—**J. W. BOOTHMAN.**

**4519. Frames for Quarter-plates.**—I did not make my question plain enough. I want frames for quarter-plate prints or opals. Either plush or wood will do, but I have been unable to get any sort of frame to fit quarter-plate; nothing seems to be sold but carte-de-visite size.—**F. PARTRIDGE.**

**4520. Hand-Camera.**—Can you tell me of or refer

me to any book how to make a hand camera to hold twelve plates, not in dark slides? It is the charging of the plate I can't see exactly.—**R. N. BREALEY.**

**4521. Interior.**—Will some reader kindly inform me what lens I should use for photographing interiors of railway saloon carriages, 50 ft. long and 9 ft. 6 in. wide? I have a Ross portable symmetrical lens No. 8, and 15 by 12 camera, but this I find is not very satisfactory; the part of carriage near the lens is much too large, and the end of the carriage much too small, that is, the perspective is too great.—**DEAF.**

**4522. Robinson's Developer.**—I have recently been using this developer—for formula please see **AMATEUR PHOTOGRAPHER** for August 29th last, page 158—but have not been so successful with it as I should like, my chief failure being want of density. In developing a plate I obtain plenty of detail with apparent density, but on fixing, I find the negative very thin, while by prolonging the development the plate becomes veiled with a green (by reflected light) fog. Will some one who has used this developer with greater success kindly suggest a remedy, and thus greatly assist—**ONE WHO IS FOGGED?**

**4523. Platinotype, Sepia Tones.**—(1) Would some one please say if sepia tones, similar to sepia-toned platinum paper tones, can be got by the addition of mercuric chloride to the developer, or can good warm tones be got? Please give formula, and say if it is better to use the oxalate developer or the cold-bath developing salts. (2) Are the Company now making smooth surface sepia-toned paper? (3) How are the pearly-blue black tones got on the black paper? They have a much nicer quality than the ordinary grey blacks.—**B. T. F.**

**4524. Lantern Slides.**—In making lantern slides by reduction in camera from larger negatives, what is the best material to use as a focusing screen? Fine ground-glass under a compound magnifier becomes too coarse to get very fine definition, and I want something with as delicate a surface as possible. Also, is there any advantage in such work in using a medium "stop" in preference to the full aperture ( $f/8$ ) of the lens? Will some one experienced advise?—**A BEGINNER.**

**4525. Development of Bromide Paper.**—Is there any solution to stop, during development, parts coming out too quickly, whilst development of the remainder is still going on?—**NEWCASTLE.**

**4526. Mountant.**—Will some one kindly inform me what is the best mountant to stick the backs on to the opalines now so fashionable?—**KENDAL.**

## QUERIES UNANSWERED.

Feb. 13th.—Nos. 4499, 4500, 4501, 4503, 4504, 4506, 4507, 4508, 4509, 4510.

## ANSWERS.

**4478. Photographs of Different Styles of Window Dressing.**—Never heard of these, but tried once myself and found I got the reflection of the houses as well as the window.—**WILLEE.**

**4479. Watch Cameras.**—Very good of their kind, but no use for serious work.—**WILLEE.**

**4480. Eastman's Transparent Films.**—Two uncut films can be developed in a large dish. I have done four together out in two strips, but it was very fiddling work. Of course, the films must lie flat on the bottom of the tray.—**E. D.**

**4481. Carbutt's Plates.**—Stock pyro solution:  
Distilled water ... .. 10 oz.  
Sulphuric acid ... .. 3 drms.  
Sulphite of soda ... .. 2 oz.

Dissolve, test with blue litmus paper. If it does not turn red, add a few drops of acid till it does. Then add:

Pyro ... .. 1 oz.  
Distilled water, to make ... .. 16 "

Stock soda solution:  
Water ... .. 10 oz.  
Sulphite of soda ... .. 4 "  
Carbonate of soda ... .. 2 "

Dissolve and add:  
Water, to make ... .. 16 cz.

Bromide solution:  
Bromide of potassium ... .. 3 oz.  
Water ... .. 5 "

Developer: Dilute sufficient of B for the number of plates to be developed by adding 4 oz. of water to 1 oz. of stock B. To 3 oz. of dilute B, add  $1\frac{1}{2}$  to 2 drms. of stock A. The more pyro the denser the negative, and vice versa. Use bromide solution in cases of over-exposure.—**WILLEE.**

**4481. Carbutt's Plates.**—The makers advise the following:

(A). Dissolve 4 oz. sulphite soda in 10 oz. water, and then add sulphuric acid 1 drms., pyro 1 oz., and water to 16 oz.

(B). Carb. potas. 2 oz., carb. soda 2 oz., water 10 oz. Take 3 drms. of A and 2 drms. of B to 4 oz. water, with a few minims of a 10 per cent. brom. potass. solution if over-exposed.—**THE SMITH.**

**4482. Copying Drawings.**—The slow Ilford plate developed with hydroquinone will do very well. Use a rectilinear lens that will cover the plate well, and

with stop  $f/22$ , reducing from 12 in. to 6 in., try an exposure of  $2\frac{1}{2}$  minutes in a well lighted room.—**THE SMITH.**

**4483. Rough Paper.**—Fry's "Naturalistic" paper will answer your requirements.—**THE SMITH.**

**4483. Rough Paper.**—Write to Fry's for a sample of their new rough paper.—**WILLEE.**

**4484. Celluloid Films.**—Fry's and England's are both very good. They are both, however, very much slower than rapid plates. I over-exposed with a 100 stop, using a Lumiere plate, and under-exposed in the same light with 42, using a film. I have never obtained a satisfactory film negative with a shutter. Perhaps Cristallo might bring them out better.—**R. D.**

**4485. Fixing and Toning Bath.**—Will keep good for two or three months, but always add  $1\frac{1}{2}$  gr. of gold for each sheet of paper toned.—**WILLEE.**

**4485. Fixing and Toning Bath.**—Keep the gold in a separate solution and add as required.—**THE SMITH.**

**4488. Films.**—Eastman film and a French one are the only rollable films. The French film is very clear. It can be obtained at Marion's.—**E. D.**

**4488. Films.**—The new Eastman film is the thing. Nothing else to approach it at present.—**THE SMITH.**

**4488. Films.**—Write to Eastmans.—**WILLEE.**

**4491. Celerotype Prints, Loss of Tone in.**—Print much darker, wash the print in a bath of glycerine and water before toning. This cures the curling of the prints.—**WILLEE.**

**4492. Snap-Shot.**—You will want a very fast shutter, rapid plate, and a good light. You will succeed best by following the object with the camera as you pass, and keeping it in the centre of the field as the shutter is released. By so doing you will probably blur all the surroundings, but the principal object will be sharper than if the camera were held stationary.—**THE SMITH.**

**4492. Snap-Shot.**—I believe it is possible, but only by experienced hands used to the work. My own results have been terribly shaky.—**WILLEE.**

**4493. Platinotype.**—Your negatives are probably too thin and weak for platinotype. It requires a strong, dense, well-contrasted negative. Try hot-bath process.—**R. D.**

**4495. Hand-Camera.**—With a little contriving, Lancaster's Merveilleux can easily be fitted as you wish. The chief objection to a half-plate lens would be that the focus is too long, and consequently, if worked at anything like a large aperture, would be deficient in depth of focus. I would not recommend a longer focus than 5 in. for a quarter-plate hand-camera.—**THE SMITH.**

**4495. Hand-Camera.**—I have seen one made into a hand-camera, but looked clumsy. But why not buy a Griffiths or Talmer? You will find it cheaper.—**WILLEE.**

**4498. Toning Bath.**—You only add 1 gr. of gold for each sheet of paper used.—**WILLEE.**

**4502. Dry Plates.**—You cannot do better than Carbutt's.—**WILLEE.**

**4505.—Installments.**—Write to A. G. Taylor, Queen Victoria Street, City.—**WILLEE.**

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—**ED: AM: PHOT.**

**NOTE.**—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.

**J. WEST.**—"Photography as a Business" is published by Percy Lund and Co., Bradford.

**WATTV.**—A very good and perfect camera; book form. Excellent slides are supplied with the camera you name.

**JOHN FRANKLIN.**—Shall be pleased to see some of your results. The plates you have selected will give you satisfaction.

**P. N. BREALEY.**—We have replied on post-card.

**SPIDER.**—No.  
**JOHN SAMUEL.**—Many thanks for the paragraph, which will, no doubt, be a wrinkle to many of our readers.

**E. F. BECHER.**—The suggestion shall have consideration, but we fear it would not turn out financially a success. We shall, however, be glad to hear from you as to what form the number should take.

**MRS. OLDSBY.**—You may certainly send in the photograph. You can now only compete for a first prize. We shall be greatly obliged if you will send us some prints for hospitals.

**GEO. F. DIETRICH (Germany).**—Thank you for the corrections.

**BOGIE MAN.**—(1) We should recommend No. 1. (2) We do not think this is patented, and you would, no doubt, obtain it from any bellows maker. The lens might fetch half-price. It certainly does not

give such good definition as a special lens for the purpose you want it. Always pleased to help you.

A. P. JENKINS.—We place as follows—3, 2, 4, 9, 10, 11, 8, 7, 6, 1.

R. GORDON.—Yes, the tone is all right.

MAURICE EGERTON.—(1) Certainly not more than fourteen days. (2) We should certainly advise screws in preference to nuts and pins.

C. E. F.—Prout's elastic glue acts well for the purpose.

UMLINA.—We can recommend either No. 1 or No. 3. The answer to your question as to No. 1 is—very good.

HYPO.—It enables the developer to flow over the plate more easily. Stock solution:

Borax	...	...	330 gr.
Acetate of soda	...	...	180 "
Bicarbonate of soda	...	...	90 "
Distilled water	...	...	20 oz.

For use, take 10 drms. of this, add 1 gr. of gold, and 10 oz. of distilled water, and mix the bath two hours before using.

PYRO.—The following is given in Wall's "Dictionary":

Pyro	...	...	480 gr.
Sulphite of soda	...	...	1,920 "
Sulphuric acid (pure)	...	...	60 mins.
Distilled water, to	...	...	10 oz.

Restraint:

Ammonia bromide	...	...	48 gr.
Distilled water, to	...	...	1 oz.

Accelerator:

Sodium carbonate ( $\text{Na}_2\text{CO}_3$ )	...	...	480 gr.
Distilled water, to	...	...	10 oz.

FEROY C. PALMER.—(1) Yes. (2) A, yes; B, certainly; C, yes.

E. SMITH.—Early in March. Thanks for letter.

LYNN.—Either would do for your purpose, but possibly No. 2 would be the better. That maker's work is to be relied on.

W. T. BARTON.—Films are certainly the less weighty, and the changing is very simple. With that proviso we should place your selections as follows—1 (No. 3), 5, 7, 6, 2, 4, 3.

J. CHAMBERLAIN.—Reporter medals will be ready in about a fortnight. Yes, we set up the papers if sent in good time, and forward proofs to be read from. Glad to see you cleared up the exhibition so satisfactorily.

ECLIPSE.—We will try and trace the paragraph, and write you.

ST. ANDREW.—Your complaint is one that should be addressed to the Secretary of the Photographic and Dealers' Association, 7, Southampton Row, W.C. We have sent on your letter. The firm is one of good standing.

W. G. FREETHY.—We do not see that there is the least injustice in the awards made. You are at liberty to inspect the prints sent to the competition if you so desire. When would you like to see them, and where shall they be sent?

VIGAM.—Will send a criticism by post. Please forgive the delay.

GREENWOOD P.M.—Many thanks. We will try and advise our correspondent as you suggest.

F. H. J. RUEL (St. John, N.B.).—(1) Certainly; No. 1, a splendid lens. (2) You will be certain, in dealing with the firm, to have a first-class instrument. (3) We shall be quite pleased to do so. (4) You cannot do better than procure a copy of the instructions issued by the Platinotype Company, 29, Southampton Row, W.C. Excellent results may be obtained by either process.

J. W. BOOTHAM.—If you make a selection we will advise you by number, but we make a rule not to name firms in this column. Many thanks for your letter.

J. THOMAS.—You will be quite safe in buying either camera; they are both well worth the money. The plates named can be used for either work, and will give good results.

ERNEST WINN.—The fact of your having been awarded a junior first does not disqualify you. If you got the bronze you could still enter for the silver. You can compete in any of the open competitions. Entry forms are sent for March, April, and May.

H. G. BRIERLEY.—We are anxious that collections should be made after exhibition of the AMATEUR PHOTOGRAPHER Competition prints or slides in aid of the restoration of the Daguerre tomb. We shall have more to say upon the subject later on.

H. C. R. HALEY (Madras).—We have your list, and will do the best with the prints sent. We are delighted to find amateur photographers so far away from "home" entering the AMATEUR PHOTOGRAPHER competitions.

A. C. EVANS (Aljarrh).—Your letter shall receive attention, and the publishers will forward special and other numbers.

R. E. NICKERMANN.—Letters sent to us, and intended for Mr. Wall, will be handed to him in due course.

FREDERICK PARSONS.—Many thanks for your long letter of advice, which we shall keep as showing what a lively interest is taken in our business by those whose personal acquaintance we have not yet had the pleasure of making. Kindly send us the name of the man you buy your papers from.

J. S. ATKINSON.—The vote of thanks from your committee is much appreciated.

H. J. L.—We are not able to say whether the lenses mentioned "are capable of really good work," but should imagine they are of the usual form of cheap R.R. lenses, many of which turn out capital work.

MR. H. BAILEY.—(1) The chances are decidedly in favour of the shorter focus lens possessing a rather flatter field, but the definition should be equal in both. (2) Theoretical considerations may prove the R.R. lens more rapid, but in practice there is not the slightest difference.

AMATEUR.—(1) If the focus of your whole-plate lens is 11 in., the focus of the front combination would be about 22 in., consequently you reduce the angle of view or amount of subject included on the plate by one-half; the front combination would probably cover 15 by 12 or larger. (2) It is advisable to use a landscape lens in preference to the front or back combination of a doublet. (3) For pure landscape work the single lens is the best. (4) The front or back combination of a W.A.R. will do for landscape work, but actually the diaphragms are not in the proper position; see answer 2. (5) Yes, there is a camera extension to be had from Shew's, Newman Street, Oxford Street. (6) Quite true, the firm has now become a Company, and we prefer their paper. (7) There is no difference.

W. H. BANKS.—We can hardly tell you where you can get such a series. You might write to Mr. Cowper Baryard, the Editor of "Knowledge," or Spooner's of the Strand, might supply some of the moon.

LINDUM.—Your answers were received and marks awarded. The examiners will disqualify you unless you keep to the limit of 250 words. The books recommended for the City Guilds are, some of them, old. We should say "Hardwick's "Photographic Chemistry," Meldola's "Chemistry of Photography," and Burton's "Optics." If you can read French, Fabre's "Traité Encyclopédique de Photographie," or, if German, Eder's "Ausführliches Handbuch der Photographie." No. 1 is, we presume, a copy of an engraving or woodcut; the results you have obtained are good. No. 2 excellent, though there is a little too much shadow in the left eye. Over-exposure is probably the cause of your smoky skies in lantern slides. We are always pleased to help you. Shall we return prints?

F. G. SHEFFIELD.—Your prints to hand; we will tone and return you in the course of the week.

BRUCE.—We reply by post.

SARDONYX.—You exposed your plates an inordinate time, consequently the whole plate was fogged. If, by an exposure of 50 secs. 2 ft. from burner, you obtained a good lantern slide, the exposure for the other plates is not difficult to determine. The lantern plate shows 5 on Warnerke's sensitometer; an ordinary plate showing 18 deg. W. will require  $\frac{1}{3}$  of the exposure. You should have therefore given  $1\frac{1}{2}$  sec. exposure to the ordinary plate at 2 ft. A rapid plate showing 22 deg. W. would require  $\frac{1}{10}$  of that for a lantern plate. A lantern plate can be used for camera work, but the exposure would be very long—45 times that required for an ordinary landscape plate.

YOUNGSTER.—(1) Soak the plates in hot water, then scrub well with a nail brush, wash well, and dry, then rub them over with a solution of yellow wax and resin in benzine or turpentine. (2) About  $\frac{1}{3}$  or 1 sec. would be about right to diffused daylight. (3) The 60-times plates.

W. T. PHILLIPS.—Send us up the money, and we will write you by post.

H. C. LEAKE.—We place as follows—B, D, E, A, C, but we should say obtain some descriptions of the new ones. Your prints are under-printed and over-toned. Try the gelatino-chloride paper you suggest for albumenised paper in preference. We prefer washing the prints well and using the separate baths. The unevenness of tone is generally due to imperfect washing. By all means try and get a camera second hand.

T. HALL.—(1) No. 3. (2) The ordinary require about seven times longer exposure than the rapid. (3) We should advise you to use the following, instead of ammonia:—Carbonate of potash, carbonate of soda, and ferrocyanide of potash, of each 1 oz. water 10 oz. Use quarter of an ounce of this to 1 oz. of solution P for a half-plate. (4) We should like to see the negatives before we make a guess at the cause. (5) Ten minutes should be the run for ordinary exposures; half an hour is too long.

J. S. COVENTRY.—No. 1 slide is under-exposed; No. 2 is better, but a little too dense. The peculiar yellow opacity in the shadows is due to the developer precipitating the silver in a dichroic condition, that is, yellow by reflected light, but purple by transmitted light. Your two slides show up well on the screen of a rich purple tone, which is often tried after, but not always obtained, except by the use of pyro. Shall we return slides?

## Quarterly Examinations in Photography.

### QUESTIONS.

16. Give the directions for sensitising albumenised paper.
17. A batch of prints refuse to tone. What are the probable causes of, and how would you set to work to find out and remedy this fault?
18. What is the best method of washing prints? (Any special make of washing apparatus must not be recommended, though the principle embodied in the construction of the same may be explained.)

(Latest Day for Answers—March 2nd.)

### RULES.

1. Answers must be received on the morning of the Monday week following the publication of the question.
2. All answers must be preceded by the question, and should be written on one side of the paper only.
3. A *nom de plume* may be used, but in every case the full name and address must also be given.
4. Answers must not exceed 250 words, unless otherwise stated by the examiners.
5. Those desirous of competing must apply to have their names entered, as these examinations are intended to encourage the study of the theory and practice of photography. Authorities upon photographic matters and contributors to the photographic journals will not be allowed to compete. Marks will be given for all answers, and when possible, the three best answers will be published. Three prizes will be awarded at the end of each quarter. All communications to be addressed:—  
"EXAMINATION DEPARTMENT,"  
AMATEUR PHOTOGRAPHER,  
1, CREED LANE,  
LONDON, E.C.

## Sale and Exchange.

**RULES.**—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny Stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

**REPORTING UPON APPARATUS.**—The Editor of the AMATEUR PHOTOGRAPHER will be pleased to report, to any intending purchaser, upon apparatus, etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the SELLER to him to the offices of the AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending BUYER to pay a fee equivalent to a commission of 2½ per cent., the minimum fee being 2s. 6d., upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the SELLER. As far as possible, the Editor will undertake to send a report within TWO DAYS of receipt of goods.

### DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

Advertisements can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 3d. to cover postage.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

"Amateur Photographer," bound, complete from beginning; what offers cash?—Rector, Elm, Frome.

AMATEUR PHOTOGRAPHER, vols. viii., ix., x., "Photography," vol. i., unbound, all complete, 60 odd numbers both papers; what offers cash?—Arthur Hunter, 14, Montague Villas, Richmond, Surrey.

Bicycle.—Will sell (£12) or exchange Premier model A safety bicycle, perfect condition, balls everywhere, hardly used, on view at Hillman, Her-

bert, and Cooper's depot, Lisle Street, Leicester Square, costing, with accessories, £21, for half-plate set, hand or tripod camera, etc., double dark-slides, or film roller, up to same cost price.—State full particulars of offers to Clifford Fothergill, Maison Sartou, Biarritz, France.

**Burnisher.**—Burnisher, half-plate, with lamp, complete; 8s.—White, Stores, Ardington, Wantage, Berks.

**Cameras, etc.**—Instantograph, half-plate, new pattern, complete, four double slides (wood), view-finder, also Gem pneumatic shutter, in thorough order, with canvas case; price 84s. on approval; deposit system.—Bate, Milton, Gillingham.

Lancaster's Instantograph (cost £5), dishes, three dark-slides; no reasonable offer refused.—Pearson, Brooklands, Uppingham.

Shew's Eclipse 5 by 4 camera, three double backs, perfect condition; £4.—Dr. Wm. Brydon, Hawick, N.B.

Photo-micrographic camera, quarter-plate, 20 in. focus, on baseboard, with turntable for microscopes; bargain, 25s.—Burr, Westgate, Gloucester.

Enlarging camera, 12 by 15, and 10 in. condenser, mounted on mahogany base, with iron standards; £7. Can be seen at the offices of the AMATEUR PHOTOGRAPHER.—W. Wells, 14, Girdler's Road, West Kensington.

**Cameras, Lenses, etc.**—Lancaster's quarter Merit, with lens, slide, and stand, also splendid tone violin, bow, and case, all in grand condition; approval; deposit.—Thomas, 1, Grugos Terrace, Port Talbot.

Half-plate Lancaster's 1891 Instantograph camera, dark-slide, tripod, fitted with f/8 R.R. lens, new; bargain, 66s.—Cheltenham House, Stroud, Glos.

Half-plate Instantograph, three double backs, three fronts, tripod, leather case for tripod, case for camera, etc.; Abraham's Challenge R.R. and Newman's shutter, cost £8 8s.; will exchange with cash if necessary for two whole-plate lenses, R.R. and W.A., or will sell for £5 5s., nett cash.—R. H. Jones, 44, Packington Street, London, N.

Lancaster's half-plate Instantograph, single lens, four double backs, tripod, instantaneous shutter, view-finder, all complete in case; £3 10s.—J. U. Sutherland, 38, Sandhill, Newcastle-on-Tyne.

Instantograph, Lancaster's quarter-plate 1890 camera, lens, shutter, two dark-slides, tripod, very good condition; 30s.—Allen, Ashburton, South Hill Park, Bromley, Kent.

Lancaster's 1890 Instantograph half-plate camera, slide, lens, shutter, stand, and waterproof bag; what offers cash?—Herbert, 4, Ausdell Road, Peckham, S.E.

For sale, camera (by Ross), 7½ by 5, movable back, three double carriers, two lenses, sliding stand, cloth, shutter (Newman's), two dark boxes to hold two dozen plates, three printing frames, lamp, nine dozen dry plates, all new; price £15 15s. the lot; approval; deposit.—H. Noble, Temple Combe, Henley-on-Thames.

Quarter-plate mahogany box camera, dark-slide, with excellent lens, suit a beginner; what offers?—T. W. Birdsall, Honeywell, Barnsley.

Fallowfield's half-plate Special camera, two double slides, Ross' portable symmetrical and Redshaw's rapid rectilinear lenses, both 7 by 5, Phoenix shutter, focussing cloth, etc., in solid leather case, with tripod stand, good as new; £8; approval.—Wood, Station Road, Grantham.

Half-plate camera, five slides, Wray's lens, Ashford's stand, Thornton shutter, best case; cost £13; offers.—Howard, 16, Perryn Road, Acton.

Whole-plate camera (by Stereoscopic Co.), conical bellows, every movement, three double backs, Optimus 9 by 7 R.R. and W.A. lenses, tripod, focussing cloth, solid leather case, all equal new; cost £27 6s. 6d.; price £17; approval on deposit.—Bygrave, 16, Canterbury Road, Brixton, S.W.

Camera, half-plate Lancaster's Instantograph 1890, reversing back and swing ditto, all latest improvements, fitted rapid rectilinear lens, Waterhouse stops, moveable hood, double slide, carrier, stand,

developing dishes, printing framer, measures, ruby lamp, etc., etc., all in very finest order; approval; £4.—Cooper, 9, Sussex Terrace, Markfield Road, Page Green.

**Hand-Cameras, etc.**—Hand-camera, 5 by 4, Lange pattern, three double dark-slides; cost £10; for £4; good condition.—Brocklebank, Christ Church, Oxford.

Hand-camera (Abraham's), takes 18 quarter-plates, rectilinear lens, f/6, adjustable self-setting and capping shutter, focussing arrangement, two finders, in perfect order; lowest price £4.—B. J. Grover, East Lynn, Woodberry Down, N.

Ideal hand-camera, nearly new, cost £6 10s., splendid results; what offers?—Beverington, 2, Liverpool Buildings, Highbury.

Hand-camera, the American "Hawk Eye," 5 by 4, with three double backs, etc., complete; £3 10s.—Baird, 15, Lothian Street, Edinburgh.

Demon detective camera, etc., for 12 plates 3½ by 3½, only used six times; cost 18s.; cash 10s.—No. 113, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

**Lanterns, etc.**—Optimus enlarging lantern, 8 in. compound condensers, mahogany body, large Argand lamp, in perfect condition, fitted case to take chemicals, etc.; cost £13; price £8.—Moon, 3, Coleman Street, E.C.

A three-guinea Lancaster's enlarging lantern, in excellent condition, almost new, £2; or exchange for good Facile or Eclipse hand-camera. Or will exchange the above, together with Optimus magic lantern, adapted for oil and limelight, with lamp, jet, and accessories, in capital order, for good binocular lantern, with two safety jets and dissolver. Parting with lanterns for no fault whatever.—William A. Everington, Merton House, Dulwich Wood Park, Norwood.

**Lenses, etc.**—For sale, a pair of Harrison's Globe W.A. lenses, 3 in. focus, cost £4 16s., price £2 10s.; Levi's portrait lens, 15s.; Lerebours and Secretan's quarter-plate portrait lens, 15s.; quarter-plate portrait lens, 10s.—F. R. Upcott, 135, Brigstock Road, Thornton Heath. (Can be seen at the offices of the AMATEUR PHOTOGRAPHER.)

Rapid rectilinear lens, half-plate, condition as new, very fine definition, covers 7 by 5 plate well to edges; approval and trial; 30s.—Lawrence, Bootmaker, Enfield.

Lancaster's quarter-plate Instantograph complete; lens, shutter, double dark-slide, stand, three printing frames, all in splendid condition; price 30s.—H. Price, Stag Hotel, East Finchley.

6 by 5 Ross' rapid symmetrical doublet, covers up to 7½ by 5, with moderate size stop; cost £5 5s.; will sell for 75s.; new last summer.—Sutton, 21, Waterloo Place, Upper Leeson Street, Dublin.

Half-plate rectilinear lens and stops (by Laverne), good definition, 40s.; quarter-plate rectilinear lens and stops (by Wood, Cheapside), 30s.; 4½ in. condenser, never used, 15s., above in perfect condition; Shew's changing bag, good condition, 9s.; approval on deposit.—H. S. Houghton Place, Amphilil Square, London, N.W.

Optimus 8 by 6 rapid rectilinear lens, solid leather case, in excellent condition; price £2 10s.—Dorset Villa, Yeovil.

Wray's 5 by 4 rapid rectilinear, Iris diaphragm, works f/5-65, never used; 52s.; cost 65s.—E. W. Toulmin, 6, Marine Parade, Hastings.

Quarter R.R. lens, Waterhouse stops, 17s. 6d.; Decoudon's photometer, 5s. 6d., as new.—Jones, 31, Beaufort Street, Brynmawr.

**Magic Lantern.**—Lecturers' complete outfit, first-class binocular lantern, sheet, two 40 ft. cylinders, regulators, gauge, tubing, etc., in first-class order, new last year; cost nearly £30; price £16 10s.; a genuine bargain.—W. North 62, New Road, Aylesbury.

**Sets.**—1891 Underwood's quarter-plate Compactum set, new; bargain, 14s. 6d.—John Slade, Sla1 Road, Stroud, Glos.

**Shutter.**—Whole-plate Kershaw shutter, 2½ in., new, perfect condition; 15s.—Cooper, Chestergate, Stockport.

Shew's Eclipse instantaneous shutter, for whole-plate lens; cost 32s.; price 12s.—John Stabb, 139, Queen's Road, Baywater.

**Sundries.**—Saxhorn in F, with extra E flat crook, soprano cornet, clarinet in C, violin with case, rosewood zither, cost £2; also tricycle, splendid condition, drives exceptionally easy, suitable for lady or gentleman; what offers? or exchange.—Clarence Jones, 44, Shear Brow, Blackburn.

Burnisher, Ashford's tripod, retouching desk, Phantom pneumatic shutter, all whole-plate, Marion's 10 by 8 Academy, background seascapes, also lot of photographic sundries; list and prices sent; letters only.—Mrs. F., Teviot Villa, Upper Caterham, Surrey.

Two whole-plate and two half-plate spools Eastman's stripping films (24 exposures) to be sold cheap; no reasonable offer refused.—W. G. Brewis, Dartington.

Send for list of cameras, etc., to be sold cheap, to Roberts, Roar's Head, Mold.

Ward and Lock's "Universal Instructor," in three vols., bound in half calf, not soiled; will exchange for good half-plate camera, with lens, tripod, and other fittings.—No. 115, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

**Views.**—Peak of Tenerife, Great Caldera of Palma, views.—Soar, 1, Sussex Villas, Kensington, London, W.

## WANTED.

**Cameras, etc.**—Lancaster's half-plate 1886 Special camera and three double slides, without lens and not preferred.—J. B., 162, High Street, Camden Town, N.W.

Shew's Eclipse camera, half-plate.—Dr. William Brydon, Hawick, N.B.

Lancaster's half-plate camera, 1890 Special, with two dark-slides, also stand for same; no lens required.—E. P., 16, Granville Road, Lewisham, S.E.

**Dark-Slides.**—One or two dark-slides for half-plate 1890 Instantograph, cheap for cash.—Dixon, 11, Penton Place, Kennington Park Road, S.E.

**Hand-Cameras, etc.**—Facile hand-camera, in good condition and cheap.—Graham, Spring Hill, Bowdon, Manchester.

Kodak, No. 2 or 3.—Hummel, 2, Thomas Street, Newcastle-on-Tyne.

**Lenses.**—R.R. lens, 8½ by 6½, by Dallmeyer or Ross.—White, Naturalist, Salisbury.

**Sets.**—Complete quarter-plate Improved Lancaster's Instantograph outfit, in good condition, cheap for cash.—W. H. G., 47, Huskisson Street, Liverpool.

Half-plate set, Instantograph or similar pattern.—Send price and particulars to Photo, 24, Darwin Street, Birmingham.

**Shutter.**—Kershaw shutter, hood 1½ in., approval; also good ruby lamp, oil.—A. H. L., 120, High Street, Portsmouth.

**Sundries.**—To exchange a print occasionally with another amateur.—Paro, care of Mr. Filtress, Chemist, Crowboro' Cross.

Rates for solar enlargements (not bromide).—E. Owen, Friar's Stile Lodge, Richmond Hill, S.W.

## Lantern Slide Exchange.

**NOTE.**—There is NO CHARGE for insertion in this column. All announcements must be received by Tuesday morning.

R. C. Ewart, Bernard Street, Leith, has 40 comic slipping slides, which he would exchange for English lakes, coating scenes, or slides suitable for children's meetings.

**PHOTO** Business for sale (Midlands), returns £250, increasing rapidly, no opposition, splendid chance for beginner; would give instructions to amateur. Price, complete, £250.—Apply, No. 114, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, E.C.

## NOTICES TO SUBSCRIBERS.

Subscriptions must be prepaid.

UNITED KINGDOM.....	Six Months, 5s. 6d.....	Twelve Months, 10s. 10d.
POSTAL UNION.....	6s. 6d.....	13s. 0d.
INDIA, CHINA, ETC.....	7s. 6d.....	15s. 3d.

## NOTICES AS TO ADDRESS.

**PUBLISHING DEPARTMENT.**—All letters containing Subscriptions, Orders, Remittances, SALE AND EXCHANGE Advertisements, or other business matters for the AMATEUR PHOTOGRAPHER are to be addressed to the Publishers, HAZELL, WATSON, AND VINEY, LD., 1, CREED LANE, LUDGATE HILL, LONDON, E.C.

**NOTE.**—SALE AND EXCHANGE Advertisements, at the charge of Three Words for One Penny, can be received as late as WEDNESDAY MORNING.

**ADVERTISEMENT DEPARTMENT.**—All communications respecting TRADE Advertisements in the AMATEUR PHOTOGRAPHER are to be addressed to PARRY AND CRAWFORD, 1, CREED LANE, LUDGATE HILL, LONDON, E.C.

**NOTE.**—Trade Advertisements are received up to Tuesday morning.

**EDITORIAL DEPARTMENT.**—All Literary Contributions, Queries and Answers, Photographs for competition or Criticism, Books or apparatus for Notice or Review are to be addressed to the EDITOR, AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C.

**NOTE.**—To ensure insertion, all Communications should reach the Editor on Tuesday.

## ENLARGING MADE EASY BY SHENSTONE'S PATENT ENLARGING LANTERN & STAND

Will give any size Picture from any size Negative. Can be used for reducing to Lantern Slides, and for Copying BEST IN THE MARKET.

Price £5 10s. complete.

For full particulars apply to

J. C. SHENSTONE, PHOTO. CHEMIST, COLCHESTER.

## OUR VIEWS.

"To hold as 'twere the mirror up to nature."—*Shakespeare.*

**OUR VIEWS.**—Monthly Lantern Slide Competitions, Portraiture and Figure Studies; the Awards—The Eastman Company, Large Profits and Enormous Turnover—Mr. Davison and Dr. Emerson—The Liverpool Photographic Exhibition—The Vienna Exhibition—How the Austrians Do their Work—Exhibition at Faversham—A Society for Epsom—The Seven Ages of Man Competition—Snow and Hoar Frost Competition—The Crystal Palace Exhibition and the Challenge Cup—The Federation of London and Suburban Societies—Brush and Pencil on Landscape Photographs—Second Triennial Photographic Exhibition at Gloucester—New Books, "Development" and "Art of Retouching"—Mr. Scholzig Reduces the Price of Sensitised Paper—Another New Hand-Camera.

**LEADER.**—Photography in Colours.

**LETTERS.**—Hydrogen from the House Main (Hargrave)—Rough Papers (Clark)—Photography in Colours (Lacy)—Liverpool Exhibition (Mayne)—Society for Epsom (MacMahon)—Emerson v. Davison (Davison)—Vienna Exhibition (Sma)—Federation of London Societies (Biden).

**ORIGINAL ARTICLES.**—Composition and Light and Shade, illustrated (Robinson)—Photo-micrography, illustrated (Pringle)—Chemistry for Photographers, illustrated (Bothamley).

**EXHIBITIONS.**—Prospective Arrangements, Liverpool.

**NOTES.**—Liverpool: Photography at Walton—Lecture on Ober Ammergan—Photographic Reproduction of All Colours—The Liverpool Society, New Members—The Exhibition. Paris: Polyglot Tickets—Coloured Pictures and Coloured Negatives.

**SOCIETIES' MEETINGS.**—Belfast—Birmingham—Blackburn—Brehin—Brixton and Clapham—Cornish—Colchester—Croydon—Devon and Cornwall—Dukinfield—Ealing—East Southsea—Enfield—Epping Forest—Formby—Glasgow—Glenalmond—Hereford—Holborn—Lantern Society—Leeds—Liverpool (Y.M.C.A.)—Loughborough—Louth—Morley—Newcastle-on-Tyne—North Kent—North London—North Middlesex—Nottingham—Paisley—Richmond—Selby—Staffordshire Potteries—Spenn Valley—Sydenham—Toynbee—West Kent—West Surrey—Wigan—Woolwich.

We note that in our second Monthly Lantern Slide Competition, "Portraiture and Figure Studies," only thirty-four competitors sent in slides. The following are the awards:—

*First Prize (Silver Medal).*

S. H. BARTON . . . . . London.

The slides are on Edwards' plates, developed with eikonogen. The titles are "Mr. S. W. Hersee as Corrigan," and a fancy portrait, "Bo-Peep." They are both admirable studies, and the technical work excellent.

*Second Prize (Bronze Medal).*

F. W. PLEWS . . . . . Leeds.

This competitor sends "The Old Stone-breaker" and "The Young Naturalists," both made by contact on Thomas' plates, developed with pyro and ammonia. A soft brown tone has been secured. The subjects are well arranged.

*Third Prize (Certificate).*

JOHN J. THORNTON . . . . . Southsea.

Two very good slides are sent by this competitor—"The Skipper's Daughter" and "An Industrious Fisherman." They are made by reduction on Fry's plates, developed with hydroquinone.

We would also call special attention to one slide contributed by Major A. Dowdall (Exeter), which is the most

perfect slide sent to this month's competition—"Playmates," a brilliantly-lighted picture from a hand-camera negative. Three children are swinging on a gate; the lighting is perfect, and the setting of the picture all that an artist could desire. Unfortunately, the other slide—"Dorcas"—sent by the Major is quite of third-class standard, so it was impossible to place his work. We draw special attention again to this inequality, and would point out that the two slides must be of equal value, as pictures and technically. In this month's competition the slides, taken all round, are of better quality, and out of thirty-four entries we have three sets prizes, one set highly commended, for one slide, eight sets in Class 1, fourteen sets in Class 2, and eight sets in Class 3. The complete list will be published in the next issue of the *Photographic Reporter*.

The shareholders of the Eastman Photographic Materials Company, Limited, should be highly satisfied with the work of the Directorate and management during the thirteen months that the Company has been at work. The growth of business done has been marvellous; the sales for the thirteen months ended December 31st, 1890, reached the sum of £50,387, and the net profit nearly £10,000. This enabled the Directors to recommend the payment of a dividend at the rate of 10 per cent. per annum on the preference shares and 5 per cent. on the ordinary stock of the Company, carrying forward a balance of £1,600. The ever-growing popularity of the transparent rollable film, the improvements made in the Kodak, and the enormous sale of bromide paper has necessitated manufacturing in this country, and we understand from Mr. W. H. Walker, the Company's courteous Managing-Director, that the first section of the extensive manufacturing premises now being built at Harrow will be in operation within two months from the present time. We have no doubt that we shall be privileged to inspect the works at Harrow, and shall, of course, give the readers of the *AMATEUR PHOTOGRAPHER* an article upon what we see and hear. We note that Mr. Walker said at the shareholders' meeting that if the Company could have only executed all the orders which poured in upon them, they could have paid a 20 per cent. dividend all round, a position to which he hoped to reach before long, when they had their factories at work.

It has been represented to us that Mr. Davison was entitled to reply to Dr. Emerson; we have, therefore, much pleasure in publishing the dignified letter sent us by Mr. Davison, and there the matter must end.

EVERYTHING promises a most successful exhibition at Liverpool. More rooms have been secured in the Walker Art Gallery than on the occasion of the last exhibition. An appeal is being made to the railway companies for reduced fares. The Exhibition will be opened on Friday, March 6th, with a *conversazione*. The Committee entertain the Judges and a select company of gentlemen interested in photography before the opening ceremony. The tickets for the opening night are being largely sought, and an enormous crowd may be expected.

We are pleased to be able to state that through the courtesy of the Exhibition Committee, practically the whole of the slides contributed to the last AMATEUR PHOTOGRAPHER Stereoscopic Slide Competition will be exhibited.

THE conditions under which the Vienna Exhibition has been promoted brings us several letters. A correspondent resident in Vienna says—"I thoroughly approve the position your valuable paper has taken up in this question. . . . I believe that if rules similar to those enforced at the Liverpool Exhibition had been issued, scarcely twenty exhibits would have been got together. Professional assistance is the rule here, not the exception, and it is the rule within the precincts of the Club. . . . I know members who do not even, and are not able to, develop their own plates. Others, again, turn out their own plates, but never do either retouching or printing. . . . Not one of these gentlemen would deny having received professional assistance, or feel the least ashamed of it."

This is interesting after the letter already published from the President of the Club. Perhaps Mr. Davison and Mr. Maskell will now recognise that the work sent from England, which has been produced *entirely* by the exhibitor, has to compete against the artistic productions of those who make their living by preparing amateurs' negatives, or prints from them. We do not consider this an elevation of photography. An artist who paints a picture, if he is an honest man, would never allow even a fellow-artist to paint out, paint in, or touch up the canvas upon which he puts his name. Why should the amateur photographer act in any way differently to the artist? We consider that if he allows another to print from his negative and exhibits the resulting photograph as his own work, it is tantamount to fraud, quite as much as for a man to purchase a picture, paint on it his own name, and exhibit it as his own work.

WE publish a letter from Herr C. Srna, the President of the Vienna Club of Amateur Photographers, in which he says it is now too late to alter the conditions. So far as the part we have taken in this matter, we are perfectly prepared to stand by every word that we have written. Instead of the conditions under which the Vienna Photographic Exhibition are held being looked upon as a model for us to follow, they are really an example to be avoided. It is no concern of ours how the Viennese conduct their exhibitions, or that the patrons and members of the Club of Amateur Photographers are contented to exhibit photographs as their work which they had no hand in producing; but when English amateurs are asked to compete who do produce their own photographs, it is time for us to show that even in so small a matter as photography the Austrian and the English are not exhibiting under equal conditions. We know that very prominent members of the Vienna Club exhibited, and were awarded prizes for photographs that practically owe their existence to professional photographers. Perhaps Herr Srna will tell us at his leisure how many members of the Club are able to produce from their own or any other negative, a platinotype print that would secure

a prize in one of the AMATEUR PHOTOGRAPHER Monthly Competitions.

THE Faversham Photographic Society are pushing ahead. They will hold their first annual exhibition from the 21st to the 24th of April inclusive. The exhibition will be devoted to the work of members.

In another column we publish a letter urging the formation of a photographic society at Epsom. Mr. P. M. Macmahon, of Upper Downs Road, will be pleased to have the support of any workers in photography living in the district.

WE would remind our readers that the last day for receiving entries for the "Seven Ages of Man" is Saturday, the 28th inst. We hope many are intending to compete.

THE next Monthly Competition, "Snow and Hoar Frost," should tempt a large number of competitors, owing to the very exceptional opportunities offered by the recent severe and wintry weather. Photographs must be received on or before the 2nd prox.

MR. S. G. B. WOLLASTON advises us that space at the forthcoming Crystal Palace Photographic Exhibition is being well applied for. He also asks us to state, in regard to rule 10, clause e, governing the competition for the challenge cup, that it means "the professional work *shall not exceed* one-fourth the number of the whole exhibits."

MORE combination! Mr. Lewis M. Biden, President of the Toynbee Camera Club, sends us a circular with regard to a meeting that he has called for Monday next, the 2nd of March, which will be held at six o'clock in the rooms of the Photographic Society of Great Britain, 50, Great Russell Street, by the courtesy of the Council. At this meeting, to which Secretaries of societies are specially invited, Mr. Biden will propose the discussion of the following matters:—

- (1) The association or federation of the London Societies.
- (2) The interchange of lectures, papers, lantern slides, etc.
- (3) As to obtaining the reduction of railway fares to amateur photographers on their outings.
- (4) Whether any proposal can be made to the P. S. G. B. for admission of the various societies as corporate members of the P. S. G. B.
- (5) How to assist in promoting the proposed Photographic Institute.
- (6) Generally to promote photographic knowledge and research.

We have the pleasure of Mr. Biden's acquaintance, and must congratulate him upon having filled a big bill. We hope that the Secretaries will support him. The questions on the agenda are all vital ones, and the discussion of them must do good. Mr. Biden is an experienced organiser, and we have no doubt that the meeting on Monday next will lead to action.

A CORRESPONDENT writes that he considers that the use of the brush and pencil on landscape photographs should not be discouraged *so long as the resulting work be classed by itself as a thing apart from pure photography*. We have long held this opinion, but must add one other proviso, that is, that the brush or pencil should be used by the person who exposed the negative.

THE second triennial photographic exhibition promoted by the Gloucestershire Photographic Society will be held

from April 20th to the 30th inclusive. We are asked to state that the date for closing entries has been fixed for March 13th. The judges will be Messrs. Valentine Blanchard, Ed. Brightman, and H. P. Robinson. The Secretary tells us that he anticipates a very successful exhibition, quite equalling, if not surpassing, the one held in 1888.

We make no apology for calling attention to a very useful little book just issued by our publishers, "Development," by Lyonel Clark, C.E. Amateur photographers will do well to purchase a copy of this book, and work in accordance with the rules and instructions clearly laid down. Another book for the more ambitious worker has been issued on the "Art of Retouching," written by J. Hubert. Those who are desirous of being able to retouch their own negatives will do well to study this book. They are both to be bought for one shilling each.

We are glad to notice that Mr. Scholzig is able to return to his old prices for sensitised paper. We hear good accounts of his new gelatino-chloride emulsion paper, which differs from others in the market as it is supplied in a white tint.

We shall next week give a description of a new hand-camera to carry 18 or 24 plates, which is one of the simplest we have ever seen, and cannot, we should say, possibly get out of order.

#### PHOTOGRAPHY IN COLOURS.

M. LIPPMANN'S note to the French Academy of Sciences at Paris, on Photography in Colours," is published in full in *Le Moniteur de la Photographie*, and we give a translation of the text of the same, with that of some notes by M. Edmund Becquerel, who, as our readers are well aware, has himself been an experimenter in this direction:—

"I proposed to obtain on a photographic plate the image of the spectrum in its natural colour and in such a way that this image should remain henceforth fixed, and be capable of being exposed to full daylight without alteration. I have succeeded in solving the problem by the aid of the sensitive salts, the developers, and the fixing agents now used in photography, by simply modifying the physical conditions of the experiment. The essential conditions for obtaining colours in photography are two—(1) the continuity of the sensitive film; (2) the presence of a reflecting surface in contact with and behind this film. I mean by continuity the absence of 'grain': it is necessary that the iodide or bromide of silver, etc., should be distributed on the interior of a sheet of albumen, of gelatine, or of some other transparent and inert substance in a uniform manner and without forming 'grain' which can be seen under a microscope; if there is 'grain' it ought to be of such a size as to be negligible in comparison with the wave length of light. The employment of the coarse emulsions of every-day use is, therefore, excluded. A continuous film is transparent, except, as a rule, for a faint blue opalescence. I have used as a support albumen, collodion, and gelatine; as sensitive salts, iodide and bromide of silver; all these combinations give good results. The plate, in a dry state, is placed in a frame into which one pours mercury; this mercury forms a reflecting surface in contact with the sensitive film. The exposure, the development, and the fixing are performed as if one wished to obtain a black negative of the spectrum; but the result is different: when the plate is finished and dried, the colours appear. The cliché obtained is negative when looked through; that is to say, each colour is represented by its complementary. When examined by reflected light it is positive, and the original colour is seen, which it is possible to obtain with great brilliancy. To obtain such a positive the image must be developed and sometimes intensified, so that the photograph shall be of a light colour, which is obtained, as is well known, by the use of acid solutions. The plate is fixed with hyposulphite of soda and is then carefully

washed. I have found that the colours are then unaffected by the most intense electric light. The theory of the experiment is very simple. The incident light which forms the image in the camera interferes with the light reflected from the mercury. Thus in the interior of the sensitive layer there is formed a system of interference bands, i.e., of bright maxima and dark minima. Only the maxima affect the plate, and after the process is terminated, the place of these maxima is marked by deposits of silver more or less reflecting. The sensitive layer is thus divided by these deposits into a series of films, each of which has a thickness equal to the interval which separated two successive maxima—that is to say, half a wave-length of the incident light. These thin films have, therefore, exactly the thickness necessary to reproduce by reflection the colour of the incident light. The colours visible on the plate are thus of the same nature as those of soap bubbles. But they are purer and more brilliant, at least when the photographic process has yielded a good reflecting deposit. This is due to the fact that there is formed in the thickness of the sensitive film a very large number of thin films superposed: there are about two hundred, for instance, if the layer is .20 millimetre (one-five-hundredth of an inch) in thickness. For the same reason the purity of the reflected colour is increased by an augmentation in the number of the reflected surfaces. These surfaces form, in fact, a kind of diffraction grating in depth, and for the same reason as in the theory of reflecting diffraction gratings, the purity of the colours increases with the number of elementary mirrors."

M. Edm. Becquerel thus comments on the above communication:—

"I wish to explain the difference which exists between the entirely physical procedure that M. Lippmann has explained for reproducing photographically the colours of light, and the photo-chemical process that I discovered in 1848 for obtaining the coloured images of the solar spectrum, as well as the images of objects with their proper colours. It is by the aid of the same chemical substance, the subchloride of silver, formed on the surface of a plate of silver, and of which I have indicated the preparation and modifications so curious under the different influences, notably under the action of heat, that I was able to attain this effect. One ought besides, at the time of the preparation of the sensitive substance, determine with exactitude, as I have done, the thickness of the film necessary for the production of these effects in best possible condition; this thickness may vary between the four-thousandth and the six-hundredth part of a millimetre. These images are absolutely unaltered in the dark, and I possess still the reproductions of the solar spectrum made more than forty years ago; also those images coloured by light which served as basis to Regnault for the preparation of the report which was presented to the Academy in 1849. They have not altered by the ulterior action of light, although the sensitive surface upon which they were obtained was not completely transformed, and is still able to be affected by the action of the different coloured rays. It was the same compound on which, still later, in 1865, M. Poitevin used to obtain on paper the coloured images which I produced on metallic plates. When one submitted the photographic images thus coloured to the reducing action of one of the solvents of chloride of silver, such as ammonia or hyposulphite of soda, the coloured shades disappeared, and there where the rays of light had exercised their action, there remained on the surface of the plate of silver a faint trace formed by a thin film of metallic silver, which, whilst it was still damp, showed feeble tints complementary to those which previously existed at the same places. These effects, which it is difficult to reckon *a priori*, show that perhaps the thickness of the films deposited play a part in the production of the phenomena of colour. This matter possesses the curious property, when properly prepared, of not only being sensitive to the action of the different coloured rays, from the red to the violet, in reproducing their peculiar tints, but still of receiving an impression which appears proportional to the intensity of the corresponding luminous impressions on the retina. I recollect, moreover, that this photo-chemically sensitive substance gives rise, at the moment of the chemical reaction which transforms them, to an electro-chemical current, the intensity of which and the electro-motive force ought to be proportional to the electro-chemical actinometry which I recognised. This current could perhaps be utilised for comparing very exactly the intensity of the different coloured active rays, for instance of the red and blue rays; when the

optical method based upon the impression exercised by the same luminous rays on the retina do not permit one to do this with very great exactitude.

"The two communications of which one can read the official text present clearly the state of the question, and they establish in a very complete manner the difference which exists between the old work of M. Edward Becquerel and the recent discovery of M. Lippmann.

"We have been permitted to see one of the proofs of M. Lippmann. We have noticed there the image which corresponds to the action of the spectrum on the plate treated as indicated by the learned Professor. The impression, or at least the sensation of the spectral colours, is very pure; certain of the proofs present at the same time a brightness tolerably vivid. We do not know at present anything so far as the practical application to which this discovery may give rise; it has proved at least the possibility of obtaining a photographic proof of the existence of interference. With regard to knowing whether experiments so delicate may serve as the basis for polychromatic reproduction, no one will be able to inform. We find ourselves here in the domain of action infinitely little. M. Lippmann himself has said that a film of one-twentieth of a millimetre thickness should be divided into films, and distinct layers to the number of 200 at least. The least irregularity in the thickness of the film in its continuity will be able to cause such disturbances of the true colours that they will be reversed. The method itself necessitates a reflective mirror in optical contrast with the sensitive film, the length of the exposure, etc., etc. The inconveniences which multiply in the midst of an operation so delicate force one to consider the communication of M. Lippmann as belonging to the domain of pure science and to wait so that the very long researches may be able to produce results very near a practical application."

## Letters to the Editor.

### HYDROGEN FROM THE HOUSE MAIN.

SIR,—On reading Mr. Pringle's article in your issue of the 13th I was much struck by his using hydrogen drawn from the house main for his mixed jet. My experience with the limelight has not been very large, but I have always been under the impression that the pressure of ordinary gas supply was not sufficient for that jet.

Mr. Pringle says farther on: "This arrangement of itself necessitates a specially small nipple." Is this on account of the pressure? Although a small nipple may have to be used, such a jet might give a better light than an ordinary blow-through, or even if not better, might give an equal light with a smaller consumption of oxygen.

Further information on this point would be of great interest to lanternists, especially those on this side of the Channel, as all compressed gas used here has to be imported. As regards the possibility of danger, means could be adopted to obviate it.—Yours faithfully,

J. H. HARGRAVE.

\* \* \* \*

### ROUGH PAPERS.

SIR,—If Colonel Noverre will turn to the *Photographic News* for 1873, p. 354-5, he will find full instructions given of M. de Constant's method of printing on plain paper, where he mentions amongst other papers "Whatman's rough drawing paper;" he also mentions a method of giving a coarse grain to smooth paper. I have never seen any of M. de Constant's productions, but I cannot doubt that he used the roughest paper obtainable, as the word rough is especially mentioned, and "not pressed," the medium quality of Whatman's paper.

Again, in a leading article in the same journal for the year 1875, p. 390-1, on "Drawing Paper for Photographic Portraiture," the phrase "rough drawing paper" is again used, and working directions for preparing the same are given.

You will, doubtless, have received many other communications referring to the early use of rough-surfaced papers in photography, but I pick these two out of my common-place book, as being particularly applicable to the present question.

I do not think that there can be a moment's doubt that rough drawing paper was used long before the 1887 Pall Mall Exhibition, but at the same time we must freely give Colonel

Noverre all credit for the revival of this most artistic method of reproducing our æsthetic impressions in monotype.—I am, etc.,

LYONEL CLARK.

\* \* \* \*

### PHOTOGRAPHY IN COLOURS.

SIR,—I am much surprised that no objection has been taken to colour photography (at least, I have seen none) on *à priori* grounds. It may be said that *à priori* judgments are worthless, but that is only the doctrine of a very small and narrow-minded school of physicists. All great philosophers—Kant, Hegel, Schopenhauer, Fichte, Spencer, Hamilton—maintain the validity of *à priori* judgments. Dialectics and ontology cannot be killed by mere materialism.

On *à priori* grounds colour-photography is a logical absurdity. Colour has no objective existence as colour. Its objective existence is as lengths and velocities in reflected rays of light, or as modes of motion. As colour it is purely subjective, and is the result of the impact of these reflected rays on certain nerves of the human organism. Nor is the result constant even on the human organism, because, as we all know, a large proportion of people are "colour blind," while it is tolerably certain that no two people see all the colours exactly alike. We have, furthermore, no proof that any brain but the human receives the sensation of colour as we know it, and the presumption, both on *à priori* grounds and on grounds of observation, is distinctly against it.

How absurd, then, to suppose that any inorganic (used in its philosophical sense) substance could receive identical impressions to those of some given human eye! Among the millions of the human race, whose eye is to be the standard? It is no answer to say that a conformation is set up in the substance correspondent to that of the colour rays, as is claimed by M. Lippmann's apologists. This is one of those plausible but vicious analogies that are scattered to the winds at the first glance of examination. What on earth is the parallelism between lengths of colour rays and thicknesses in layers of silver salt? It is mere words. There is nothing on which comparisons can be made; nothing of which the mind can take tangible grasp. It is merely making a physical model of hypothetical rays. But colour is not a physical substance; it is a subjective impression. You might as well make a physical model of heat or light. The absurdity becomes greater when we remember that even this model has no objective existence until its physical molecules have been re-arranged into chemical atoms by a process of decomposition set up with the aid of other inorganic substances!

Let there be no mistake; there is no real analogy between ordinary photography and photography in colours. The one is a mere physical record of the actinic value of reflected rays of light; the other is an attempt to reconstruct phenomena as subjectively manifested to the sensorial nerves of the human brain-stuff.

I am no scientist, and I have no doubt that some of your scientific bigwigs will be able to smash me (to their own satisfaction, at least) into very little bits. But I am a bit of a philosopher and logician, and I go straight to the common sense of the thing, and that assures me that the whole theory is a philosophical absurdity. I know enough of science, however, to see that Mrs. Crawford, from whom you have taken your account, knows less. What she calls the "inductive method" is the negation of induction. Induction is an empirical step-by-step inquiry, arguing from particulars to generals. This "discovery" of M. Lippmann was attained by jumping from a general to a particular.

Of course, I know that I shall be told that as the thing has been done, all my *à priori* arguments go for naught. Very good; when I see a human entity attain so far to a knowledge of things in themselves as to be able to reconstruct phenomena, and set them up on high where all the world can see, I will believe, but not until then. But I suspect that during my time man will remain a relative quantity, and not attain to the absolute.—Yours faithfully,

G. LACY.

\* \* \* \*

### ARISTOTYPE PAPER.

SIR,—As the decomposition indicated in my last letter actually takes place when using an alum bath after hypo, my objection can hardly be called theoretical. It is true that alum has been recommended for eliminating the last traces of hypo, and this it will do merely by destroying it, but it has long been recognised that it is far better to use plenty of water than any hypo eliminator. When manipulating large-sized chloride emulsion prints I

have found the following method of procedure not only convenient but capable of conferring all the advantages which Mr. Greenwood Pim desires, and at an earlier stage of the process, which is an advantage. It is applicable also to prints which are to be treated in the separate or combined toning and fixing baths; the toning is more even, and more under control, and there is less chance of accidental damage or curling of the support in the baths. The prints are placed face downwards on a dish of clean water, then bodily immersed as soon as the edges curl up; this water is changed as quickly as possible, and the process repeated till the water shows hardly any cloudiness; the prints are then immersed for five minutes in the following solution:—

Chrome alum .. .. . 1 part.  
Water .. .. . 100 parts

When dissolved, add—

Ammonia '880, drop by drop,

till, on shaking or stirring, a permanent precipitate appears; the solution is then filtered and is ready for use. The prints are well washed, and then toned in any desired way. It is true this entails a little more expenditure of time and water, but the results are excellent.—Yours truly,  
E. J. WALL.

#### LIVERPOOL EXHIBITION.

SIR,—The following was addressed to the railway companies running out of Liverpool.

I would be glad if local photographic societies would aid our efforts to obtain greater railway facilities than we at present receive.—Yours truly,  
THOS. S. MAYNE.

Liverpool, 24th February, 1891.

#### INTERNATIONAL PHOTOGRAPHIC EXHIBITION, 1891.

Dear Sir,—This important function (triennial) takes place this year, March 6th till April 4th. It will, without doubt, be on the largest scale of any similar exhibition ever held in the kingdom. The Liverpool Corporation have granted the use of the greater portion of the Walker Art Gallery. We anticipate visitors to the extent of at least 50,000.

Probably the interest in the Liverpool Exhibition is everywhere the feature of importance in photographic circles over the country.

We now only want the help of the railway companies to double our number of visitors. The growing popularity of photography with the rising generation amongst all classes of our community, from the highest personages to the middle class and enlightened artisans, is not recognised to the extent it deserves by railway companies. Like cycling, it is only in its infancy; photography and cycling are the landmarks of the nineteenth century as elevating pastimes.

What I now beg you to grant is return tickets at single fare (day tickets), during the currency of the Exhibition, from all stations within thirty miles of Liverpool, to holders of our season tickets, or purchasers of single admissions, which tickets I will provide you with (the shilling admission tickets). On hearing from you I will circularise all the local and county photographic associations within this radius.

I have written this letter to your brother railway superintendents of the three chief railways terminating in Liverpool.

The favour of an early answer is requested.

THOS. S. MAYNE (Hon. Sec.)

\* \* \* \*

#### SOCIETY FOR EPSOM.

SIR,—It is proposed to organise a photographic society for Epsom and the district. Among those living in the neighbourhood there may be many who would wish to join it if the matter were brought to their notice.

I shall be glad if any one who is interested in photography and wishes to join the society will send his name to me.—Yours truly,  
P. M. MACMAHON.

Upper Downs Road, Epsom, 23rd February, 1891.

\* \* \* \*

#### EMERSON v. DAVISON.

SIR,—I do not think any detailed reply is needed to Dr. Emerson's personal attack on me published in your last issue. I hear but one opinion on all sides. The letter carries its own confutation on the face of it, and I decline to follow in the line of violent and unscrupulous personalities which it seems natural to

Dr. Emerson to adopt. If he has any serious inquiries to put, any arguments to maintain, or, indeed, any "expostulations" to make, and can do so in a fairly dignified manner, I shall be prepared to answer, confute, and explain. It will certainly not be necessary for me to descend to intemperate language nor to grub amongst his private letters to exhibit publicly what a delightfully pleasant gentleman Dr. Emerson is! Your readers have the picture direct from himself.—Yours faithfully,  
GEORGE DAVISON.

February 21st, 1891.

\* \* \* \*

#### VIENNA EXHIBITION.

SIR,—We were just going to answer your editorial in your former number when there reached us the new one in which Mr. Alfred Maskell and Mr. George Davison have taken up our cause so warmly and exhaustively that we have nothing more to add.

For the rest, the Club, at its general meeting on the 14th inst., resolved: "That as the time for non-Continental entries has passed, nay, as some pictures have already been received, it is absolutely impossible to alter the wording of our original circular of invitation."—We are, Sir, yours truly,

Vienna, Feb. 21st, 1891.

CH. SRNA (President).

\* \* \* \*

#### THE FEDERATION OF LONDON SOCIETIES.

SIR,—I am sending a circular to all photographic societies in or near London, according to the most recent list in my possession. As, however, some societies may have been overlooked, or owing to changes may not receive the circular till too late, will you allow me to say through your columns that, where a society cannot be officially represented, I trust the Secretary, and a member of the committee will attend in a private capacity.

Also I shall be glad to hear from the Secretary of any country society approving of the proposed association.—Yours truly,

LEWIS M. BIDEN.

11, Leadenhall Street, London, E.C.

February 20th, 1891.

(NOTE:—We refer to the subject matter of the letter in "Our Views."—ED: AM: PHOT:)

## Reviews.

*Geschichte der Photographie.* By C. Schiendl. Published by A. Hartleben, Maximilianstrasse 8, Vienna I. Price 8s.

One would naturally suppose that in the face of the publication of the excellent and complete "History of Photo-chemistry and Photography," by Dr. Eder, which has just been published, there would be no room for another "History of Photography;" but Herr Schiendl has given us a work which cannot fail to make its mark in photographic literature. The early history is briefly but thoroughly touched upon, the author reserving his powers for a most complete and exhaustive treatment of the advances made in the later discoveries; he gives us a summary of all that is known of Niepotype, daguerreotype, photography on paper, collodion processes, the early photo-mechanical processes, emulsion processes, and the more modern processes of photogravure, photo-zincography, etc. We then come to what is perhaps the most valuable portion of the work before us, and that is a summary of the scientific and theoretical investigations into the various photographic processes and the application of photography to scientific purposes. We thus find the whole of our knowledge of the latent or invisible photographic image summarised, and the opinions of authorities on this and similar subjects are given as far as possible in full. The possessor of such a work as Herr Schiendl has here given us will be saved a great deal of trouble in referring to the past history of photographic science and art. The information is brought fully up to date, and is very comprehensive, the closing chapters of the book being devoted to photogrammetrie or surveying by photography, photography in natural colours, artistic photography, and the new aniline dye process. The work is embellished with a frontispiece, containing the portraits of Niepce, Niepce de St. Victor, Daguerre, Mungo Ponton, Fox Talbot, Gaudin, Petzval, Albert, Poitevin, Davanne, Carey Lea, Abney, and H. P. Robinson, and also by a reproduction of the first photograph published by J. Nicéphore Niepce in 1824, and made by contact printing from an engraving on a sheet of zinc coated with sensitive bitumen.

**Photography and Lace.**—A Nottingham lace firm employs a photographer to photograph natural groups of ferns and plants to serve as suggestions for lace patterns. The idea is a happy one.

## Composition, and Light and Shade.

*Selected and arranged for the use of Photographers, from "Burnet's Essays," with Introduction and Notes.*

By H. P. ROBINSON.

### CHAPTER V.

*Fig. 8.* Rubens in his landscape has carried the lines of the clouds, trees, and ground all in the same direction; and, from his placing the sun near the point of sight, even his shadows take the same course. When the most prominent or strong dark of the foreground is detached from the side of the picture, it has not only a less formal appearance, but acquires a force from its being cut out on both sides by light; as we shall find when we come to treat of Chiaroscuro. The lights also acquire a force and brilliancy from their being surrounded with dark, and the extent of the distance and continuity of the line are not altogether interrupted.

*Fig. 9.* In this subject, "Huntsman going out in the Morning," we have the principal group of a complete form in itself, yet forming a part of a whole, in consequence of its being carried round by the two dogs in the foreground, and connected by the principal dog in the other group turning round to the noise. As it is a doubt in the minds of some artists, how far it is agreeable to the rules of composition to admit a figure complete in itself as a portion of a group, I shall only observe here, that, as far as form is concerned, their objection cannot apply; and, as to individual parts, we see not only heads and hands complete as to form and light and shade, but we find that even an eye is capable of possessing all the characteristic beauties of the art. In fact, this application of it in the abstract, as well as in the aggregate, pervades everything.

An object must not only appear to possess those properties adapted by nature for its purpose and protection, but also those qualities which have been found by the experience of the best masters productive of beauty; this renders

FIG. 9.—P. DE LAER.

it a source of gratification; and it is then said to be true to nature and art. For example, if we examine an eye turned from the light, we perceive a breadth of chiaroscuro; the white, or cornea, producing a mass of light, the iris and

pupil a mass of shade. We find each of these focussed, and a small portion of the strong dark and strong light brought in contact; and the light passing through the iris gives it its transparency, and serves instead of reflected light to clear up the shadow; the watery fluid, in the bottom of the eye and on the under eyelid, gives us that portion of minute finish necessary in all works of art, to which even the protecting hairs contribute. We have here a picture complete in itself; but if we carry our examination to the surrounding lines in the orbit, we perceive a har-

FIG. 8.—RUBENS.

monious communication and extension of its form, lights, and darks, by which its harshness is softened and diffused, and it becomes a part of the composition of the whole countenance.

*Fig. 10.* I have given a gradual advancement of the most prominent and dark part of a composition, until, in this example, we have the strongest point brought into the centre. In the original, "The Embarkation of the Prince of Orange," the two principal figures are dressed in strong red, and strong black, and are the most cutting part of the group; and, from their being brought into the centre and against the most retiring part, and surrounded by light, Cuyt has rendered them of the greatest importance, though occupying only a very small portion of the picture.

In fig. 9 we have a more complicated example of composition showing the connection that should exist between the parts of a picture so that one harmonious whole should be produced. Unity is one of the essential constituents of a successful picture. No two episodes should appear unconnected with each other. In photography it is too often the practice to scatter figures unsuitably to the scene, over the foreground of a landscape without any reference to each other, or the propriety of their being there at all. This is, of course, worse than omitting them, but, with few exceptions, a landscape without a figure does not make so agreeable or interesting a picture as one in which they appear, when they belong to the scene and are naturally placed. So much, however, is the difficulty of using them felt, that even experienced photographers, instead of thoroughly studying the subject, have weakly tried to cut the Gordian knot by arguing that landscapes are much better without them. It is always easy for the weak and indolent to find excuses for, and to be easily pleased with, inferior work when it is their own. This weakness is increasing and requires a strong answer; I give it in the eloquent words of Mr.

Ruskin:—"All true landscape, whether simple or exalted, depends primarily for its interest on connection with humanity, or with spiritual powers. Banish your heroes and nymphs from the classical landscape—its laurel shades will move you no more. Show that the dark clefts of the most romantic mountain are uninhabited and untraversed; it will cease to be romantic. Fields without shepherds and without fairies will have no gaiety in their green, nor will the noblest masses of ground or colours of clouds arrest or raise your thoughts, if the earth has no life to sustain and the heaven none to refresh. It may perhaps be thought that, since from scenes in which the figure was principal and landscape symbolical and subordinate (as in the art of Egypt), the process of ages has led us to scenes in which landscape was principal and the figure subordinate—a continuance in the same current of feeling might bring forth at last an art from which humanity and its interests should wholly vanish, leaving us to the passionless admiration of herbage and stone. But this will not and cannot be. . . . Where humanity is not and was not, the best natural beauty is more than vain. It is even terrible; not as the dress cast aside from the body, but as an embroidered shroud hiding a skeleton. . . . Therefore, it is that all the power of nature depends on subjection to the human soul. Man is the

FIG. 10.—CUYP.

sun of the world; more than the real sun. The force of his wonderful heart is the only light and heat worth gauge or measure. Where he is, are the tropics; where he is not, the ice world."

(To be continued.)

## Photo-Micrography.—V.

BY ANDREW PRINGLE.

### USE OF THE BULL'S-EYE, CONDENSER, OBJECTIVE, CORRECTION COLLAR, OCULAR, ETC.

WE now come to the first steps actually to be taken when we propose to do some work. The first thing is to get all the centering accurate, and this is the way to do it. I suppose the work to be done is of a moderately easy kind, but not the very easiest. Light the lamp, or the lime-light, or the electric lamp. If an oil lamp, turn the edge of the flame towards the substage. Have a condenser in the substage (the front element, or "hemisphere," of the condenser may have to be removed). Have an objective (say 1 inch) in its place, close the iris of the condenser as far as it will go, or put a pinhole stop in or on the condenser. Get light to shine through the condenser somehow, no matter how, and rack the tube up and down, and the condenser up and down if need be, till an image of the iris is seen by looking

down the tube with a low-power ocular in the usual way. When the iris image is seen, centre it by the centering screws of the substage. Open the iris a little, rack the tube till an image of the flame is seen somewhere on the field. The lamp is to be moved in all directions till the flame image lies straight up and down the centre of the field. I presume that the camera, microscope, and light have already been centred as directed in Chap. II. (The centering described in the present chapter should be done frequently, certainly every time after the light has been moved.) We have now a streak of light straight down the middle of the circle forming our "field." Next place the bull's-eye (plane side towards the light) so that the light is exactly in the focus of the bull's-eye to give parallel rays on the other side, and place the bull's-eye so that a bundle of parallel rays falls directly on the back of the substage condenser. (For the method of arranging focus and centering of bull's-eye see last chapter.) If now we look down the microscope we shall find a powerful and even light all over the field; with the lime-light, if the condenser is not nearly closed, it will be dangerous for the eyes.

I must now explain a certain matter which is easy to understand if the reader will try things for himself, as directed above. If the condenser have a short focal length so much the smaller will be the image of the flame (without the bull's-eye) on the field. If the objective be of low power, so much the less will that image be magnified on the retina and on the sensitive plate. But if the condenser have a long equivalent focus, or the objective a great magnifying power, and, still more, if both of these conditions obtain, we may not have a narrow streak of light down our field, but one so broad as to cover our field. As a rule, however, we have with low and medium powers only the streak, and it is most awkward and unsightly to work with. With high-power objectives the streak is so magnified as to cover the whole field evenly, and in such a case the bull's-eye is not necessary. I used, in cases like this last mentioned, to omit the bull's-eye, and

to advise its omission, but now I may say I always use a double bull's-eye of the Herschel type. I now always get an evenly-lighted field—which I sometimes missed when using no bull's-eye—and I find I can do quite as good work, even to the flagella of the minutest organisms, as *B. Termo*, with the bull's-eye as without it.

For the best rendering of an object, visually or photographically, the object, or the critical plane of it, must be in the conjugate foci of objective and condenser. (Fig. 4.) The condenser "must be in focus" on the object, so must the objective. If we put an object on the stage, and focus

L=Objective. C=Condenser. O=Object.

FIG. 4.

it with our objective, we can easily focus the condenser also if we have no bull's-eye; all we have to do is to rack the condenser till we get the flame image sharply defined across the object, as seen through the objective, and be it noted this is a grand—some say the only true—image. (Mr. Nelson aptly describes the

NOTE.—Mr. Pringle has kindly consented to answer any questions on photo-micrography. Letters should be addressed care of Editor.

microscopic image as an image of the radiant with the object stopping certain of the rays from the radiant.) But when we interpose a bull's-eye, the bull's-eye practically becomes the radiant, the focus of the condenser is altered (parallel in place of divergent rays falling on it), and we cannot focus the new radiant unless we put something on its surface, or in it, by which we can see to adjust the focus. An iris, or a small aperture on or in the bull's-eye, will enable us to focus it, and so I put on the bull's-eye a cap, with a small aperture, and now I can focus any condenser for the bull's-eye as easily as for the naked flame. A piece of paper stuck *pro tem.* to the front of the bull's-eye would answer, but, of course, the paper would have to be removed before work really began.

Here then are the steps to be taken, in order: Centre the condenser; centre the radiant; focus the objective on the object; focus the condenser on the object by flame, or by stop in bull's-eye. The bull's eye, if used, to be focussed and centered as described.

If the field is now not wholly lighted, the condenser is of too short focus for our objective. Racking down the condenser is often a cure for this state of matters, but it is a bad cure. It is better to use a condenser of longer focus, which may often be obtained by removing the front element of the condenser, which, of course, will then require to be refocussed.

Now we want to know how much of our objective is being utilised. Remove the ocular, and look down the tube at the back combination of the objective. The area we see brightly lighted is the area utilised. Nearly all the lenses I have work best when they are about two-thirds full of light, as observed in this way. Very few lenses will stand being fully lighted, but if we cut off too much light by means of the iris in the condenser (that is the way to do it) we lose aperture, and consequently the good qualities of our glasses. But with very thin, or very pale, or very pellucid objects, we are forced to cut down aperture, otherwise great *photographic* difficulties will confront us. Up to two-thirds of my objective I always use as much aperture as my object will permit, and, of course, with test objects I often have to go beyond the two-thirds.

Objectives of medium and high powers have usually—ought always to have—“correction collars,” which are used to alter the position of the elements with relation to each other, in order to adapt the entire objective for different thicknesses of “cover glasses,” and for different positions of the object with relation to the cover glass. With Zeiss' immersion apochromatics this accommodation is gained by altering the distance between ocular and objective (by means of the draw tube, which for this reason, should have a rack motion). Now these “collars” and “tube lengths” puzzled me greatly for months; it is easy to see the effect, but I found it vastly difficult to regulate it. My advice is, place the collar at about its medium point, and work slowly around that point on each side of it till the best image is obtained; the same with tube length; nothing but practice and eye education will ever teach the proper use of these most important “corrections.” For example, take one of the hairs in the intertubular spaces in the blowfly's proboscis, examine with a  $\frac{1}{2}$  or  $\frac{1}{4}$  in. glass, adjust the tube or the collar till the hair selected shows as long and as sharp as it can be made to show; that is the “correction” for that hair—more I cannot say.

We next pass to the use or non-use of the ocular. My experience is that the apochromatic glasses of Zeiss will not work well without an ocular, but all other lenses I have tried project good images without an ocular, provided, of course, they are properly corrected for photography. Sometimes, I am informed, an ordinary Huyghens ocular projects

an image suitable for photography, but I always use a projection ocular, if any. I have found many ordinary achromatic objectives to work well with a projection ocular, for instance, Mr. Swift's cheap one-twelfth, also certain glasses by Reichert, Seibert, and others. If no ocular is to be used nothing remains after focussing, except to turn the microscope to the central position, pull forward the light-excluding hood of the camera, project and focus the image on the screen, and make the exposure. But if a Zeiss projection ocular is to be used, the procedure is not quite so simple. Project the image on the ground-glass where a round black “mask” will be seen surrounding the lighted field. This “mask” is the image of the diaphragm in the ocular, and the edge must be focussed by moving the graduated collar which will be found on the projection ocular. This requires focussing for every different length of camera-stretch and tube-length. Having focussed this, I put into the back of the camera, close to the sensitive plate, a sheet of metal having in it an aperture just the size of the picture I require, in nearly all cases a circle of three inches diameter.

Arrange the picture on the ground-glass, then substitute a sheet of plate-glass with a few diamond lines on its front, focus with a Ramsden or other suitable focusser, and all is ready for the next, somewhat critical, operation—exposure.

(To be continued.)

## Chemistry for Photographers.

By C. H. BOTHAMLEY, F.I.C., F.C.S.

(Continued from page 112.)

THE solubility of gases in water and other liquids depends upon (1) the nature of the gas and of the liquid, (2) the temperature, and (3) the pressure under which solution takes place.

In the case of water, hydrogen, oxygen, and nitrogen are very slightly soluble; sulphur dioxide and hydrogen sulphide are moderately soluble; hydrochloric acid and ammonia are very soluble.

The effect of temperature is precisely the opposite to that which it exerts in the case of solids; as the temperature rises, the solubility of gases decreases. The following table shows the weight in grammes of hydrochloric acid dissolved by 1 gram. of water at different temperatures:—

0°	0.825	32°	0.665
8°	0.783	48°	0.603
16°	0.742	60°	0.561

Pressure increases the solubility, the weight of gas dissolved being proportional to the pressure. Ordinary aerated waters contain carbon dioxide which they have dissolved under pressure, and when the pressure is released by the opening of the vessel, the excess of gas escapes, causing the well-known effervescence.

The solubility of liquids in liquids presents more complex phenomena. When one liquid will take up another in any proportion, and form a homogeneous mixture, as in the case of water and alcohol or water and glycerol, the two liquids are said to be *miscible*. When one liquid will not take up more than a certain proportion of another, the second liquid is said to have a limited solubility in the first. If small quantities of ether, for example, are shaken up with water, the ether completely dissolves, but if the two liquids are agitated together in about equal proportions, the mixture on standing quickly separates into two distinct layers, the upper being ether with about 3 per cent. of water, whilst the lower is water with about 10 per cent. of ether. ## THE "BOYS OWN" QUARTER-PLATE SET.

This is the Cheapest Quarter-plate Set obtainable; it includes Camera, Lens, Folding Tripod and Double Dark Slide; is well made and highly polished.

**Price only 7s. 6d.**

This Camera is designed to supply the long-felt want of a thoroughly good article at a low price. When closed it occupies an extremely small space, is very light, and has all necessary movements. It is adapted for long and short focus, and specially fitted with an arrangement which enables the Camera Back to be moved to the front of the Camera Bottom, so that when using a wide angle Lens there is no chance of the Base Board cutting off part of the picture.

## PHOTOGRAPHIC PUBLICATIONS.

Every Worker in Photography should buy the following books.

**DICTIONARY OF PHOTOGRAPHY.** By E. J. WALL. New and revised edition, 2s. 6d.

It contains more information on Photography than any book published.

**BOOK OF THE LANTERN.** By T. C. HEPWORTH, F.C.S. Third edition, 3s. 6d.

The only book published that gives complete instructions as to how to make lantern slides, purchase and work the optical lantern.

**ART PHOTOGRAPHY.** By H. P. ROBINSON. 1s. ; cloth, 1s. 3d.

In this book Mr. Robinson deals with Art in a manner which the student can understand and appreciate. No amateur should be without it.

**ART OF RETOUCHING.** By J. HUBERT. 1s. ; cloth, 1s. 3d.

The cheapest manual on "Retouching," written by one who knows, for those who wish to learn.

**PLATINUM TONING.** By LYONEL CLARK. 1s. ; cloth, 1s. 3d.

This book has revolutionised printing processes. The instructions given by Mr. Clark permit of obtaining the most delightful range of tones. Every one should buy a copy, and learn how to do it.

**EVENING WORK.** By T. C. HEPWORTH, F.C.S. Just published, cloth, 2s. 6d.

This is a most delightful book, from which any number of good things may be learnt. The chapters on the application of the ELECTRIC LIGHT to photography are most interesting and instructive.

**PICTURE MAKING BY PHOTOGRAPHY.** By H. P. ROBINSON. Cloth, 2s. 6d.

Is a book for the art student to study carefully. The examples given will help him materially to make pictures.

**EXPERIMENTAL PHOTOGRAPHY.** By CLEMENT LEAPER, F.C.S. 1s. ; cloth, 1s. 3d.

This book is a guide for the beginner, and traces the whole course of work for any one taking up photography. It should be the constant companion of the Amateur Photographer.

**CAMERAS, LENSES, AND SHUTTERS.** By Sundry Writers. 1s. ; cloth, 1s. 3d.

This book contains many valuable articles upon apparatus, contributed to the *Amateur Photographer* competitive papers, and which were awarded prizes.

**DEVELOPMENT.** By LYONEL CLARK. 1s. ; cloth, 1s. 3d.

A very handy book on developing, which should be read by all; it also contains an article upon the use of Eikonogen. Mr. Clark's successful photographic work should induce many to acquire a knowledge of how it's done.

**A TOURIST'S EQUIPMENT.** By Rev. PRECENTOR MANN, M.A. 6d.

A very useful little pamphlet, giving the most complete instructions as to what kit to take, how to use it, and other useful "tips" for the touring photographer.

**PRIZE PICTURES: THREE WEEKS IN NORWAY.** By PAUL LANGE. 2s. 6d. ; cloth, 3s. 6d.

This book contains several most beautiful views of Norwegian scenery from negatives by the author, also a brightly written account of the trip. The illustrations are allowed to be some of the finest ever produced.

NOTE.—Any *Photographic Publication* can be supplied by Messrs. HAZELL, WATSON, & VINEY, LD., and a full list of books upon Photography will be sent upon application.

London: HAZELL, WATSON, & VINEY, LD., 1, Creed Lane, E.C.

# LANTERN SLIDES,

PLAIN OR COLOURED.

Selections from Lecture 26—London to Bridport.

This Lecture consists of 60 Slides, includes views of interest at Portsmouth, Southampton, Cowes, Shanklin, Osborne, Bournemouth, Salisbury, Winchester, etc., etc., and in conjunction with the well-written lecture which accompanies it, forms a splendid evening's entertainment.

The most interesting of Messrs. POULTON & SON'S Extensive Stock of English and Welsh Views may be had from any Optician.

SEVERAL NEW SETS IN PREPARATION.

CATALOGUES AND ALL PARTICULARS ON APPLICATION TO ANY OPTICIAN.

former is an ethereal solution of water; the latter is an aqueous solution of ether. Very little is known of the laws which govern the solution of one liquid in another. Some liquids, such as oil and water, are only soluble in one another to an infinitesimal extent.

*Hydrogen peroxide* or hydrogen dioxide,  $H_2O_2$ , is obtained by the action of dilute acids, preferably sulphuric acid, on barium peroxide  $BaO_2$ , thus  $BaO_2 + H_2SO_4 \text{ dil.} = BaSO_4 + H_2O_2$ . Barium sulphate is precipitated, and the hydrogen peroxide remains in solution. The aqueous solution can be concentrated by evaporation at a low temperature until it is a thick oily liquid, but cannot be obtained free from water, because beyond a certain concentration the hydrogen peroxide decomposes into water and oxygen. If moderately strong solutions are heated, the same decomposition takes place, and becomes explosively violent if the temperature approaches  $100^\circ C$ . At the ordinary temperature the change takes place spontaneously, but can be very greatly retarded by mixing the solution of hydrogen peroxide with pure ether. A great tendency to part with the second atom of oxygen is, in fact, the characteristic property of hydrogen peroxide, and makes it a powerful oxidising agent. Strong solutions are highly caustic, and moderately strong solutions have valuable bleaching properties.

EXPERIMENT 96.—To a solution of any lead salt add a small quantity of sodium hydroxide (caustic soda) solution, and then some hydrogen peroxide solution; the white precipitate of lead hydroxide  $Pb(OH)_2$ , will become brown owing to its oxidation to lead peroxide  $PbO_2$ .

EXPERIMENT 97.—Make a similar experiment with a solution of a manganese salt; the white manganous hydroxide is oxidised to dark-brown hydrated manganese dioxide  $MnO_2$ .

EXPERIMENT 98.—To a mixture of starch paste and a small quantity of potassium iodide solution, add a few drops of hydrogen peroxide solution; the iodine is liberated from the potassium iodide and combines with the starch to form a dark-blue compound.

In all these cases the hydrogen peroxide acts as an oxidising agent, giving up half its oxygen to the other substance, and being itself reduced to water  $H_2O_2 = O + H_2O$ . There are certain cases, however, in which the other substance is also reduced, part of the oxygen from both bodies escaping in the free state.

EXPERIMENT 99.—In a test-tube, place a small quantity of solid potassium permanganate,  $KMnO_4$ , and to it add some hydrogen peroxide solution; effervescence takes place, owing to the liberation of oxygen, which can be recognised by its power of rekindling a glowing splint of wood. This oxygen comes partly from the hydrogen peroxide and partly from the permanganate, both compounds being reduced.

If hydrogen peroxide is added to silver oxide, the latter is reduced to metallic silver, and the former is reduced to water, the oxygen escaping as gas  $Ag_2O + H_2O_2 = Ag_2 + H_2O + O_2$ . These reactions show that there is an attraction of atoms of oxygen for atoms of oxygen, sufficient to cause the decomposition of compounds in which oxygen is very loosely combined with the other constituents.

EXPERIMENT 100.—To a dilute solution of hydrogen peroxide add some ether and then *two or three drops* of a solution of potassium dichromate previously acidulated with sulphuric acid, and agitate: a deep-blue compound is formed, dissolves in the ether, and rises to the surface when the liquid is allowed to stand. This is a characteristic and delicate test for hydrogen peroxide.

Hydrogen peroxide is formed during the partial oxidation of turpentine and other essential oils, which results from their exposure to air, and it is probably to this fact that the disinfecting power of these oils is due, since hydrogen peroxide rapidly attacks many forms of organic matter.

#### NITROGEN COMPOUNDS.

*Nitrogen and hydrogen* form three compounds, but only one of them need be considered in detail. This is *ammonia*  $NH_3$ , a gas which is formed from the nitrogen and hydrogen in coal during the manufacture of coal-gas, and which is absorbed in water, and yields the "ammoniacal liquor" of the gas works. From this solution the various compounds of ammonia are prepared.

*Ammonia* itself is most conveniently obtained by heating one of its compounds with some non-volatile base.

EXPERIMENT 101.—Mix a small quantity of ammonium chloride (or bromide) in a test tube with some caustic soda solution, and heat gently. A gas is evolved which has a peculiar pungent smell, turns red litmus paper blue, and forms dense white fumes when a glass rod dipped in strong hydrochloric acid is brought near the mouth of the tube. The white fumes are ammonium chloride  $NH_4Cl$ , formed by combination of hydrochloric acid with ammonia. The action of the caustic soda is represented by the equation  $NH_4Cl + NaOH = NH_3 + NaCl + H_2O$ .

EXPERIMENT 102.—Mix some ammonium chloride with powdered quick lime, and heat the mixture. Ammonia is evolved in this case also.  $CaO + 2NH_4Cl = 2NH_3 + H_2O + CaCl_2$ .

The well-known "ammonia liquor," also called "spirits of hartshorn," is a solution of ammonia in water. It slowly loses ammonia at the ordinary temperature, and rapidly when heated.

EXPERIMENT 103.—Place 200 c.c. of strong ammonia solution in a flask fitted with a cork, and a straight delivery tube about 20 cm. long. Invert a *dry* bottle over the delivery tube so that the end of the latter is near the bottom of the bottle (fig. 26), and gently heat the flask; ammonia is evolved, and being little more than half as heavy as air, collects in the bottle, and gradually expels the air. After a short time a piece of red litmus paper held just outside the mouth of the bottle will turn blue, showing that the bottle is filled with ammonia. Lift it slowly from the delivery tube, place a piece of card or stiff paper over the mouth, and, keeping it mouth downwards, bring it near a basin of water; remove the card, and put the mouth of the bottle into the water. The water will at once rush up into the bottle, owing to the rapid absorption of the ammonia.

EXPERIMENT 104.—Fill another dry bottle with ammonia in the same way, and bring a lighted taper to the mouth of the bottle and pass it up into the bottle. Observe that the taper goes out, but that there is a flicker of greenish-yellow flame at the mouth of the bottle. Ammonia is not a supporter of combustion, and when mixed with air is but slightly combustible. When mixed with oxygen it will burn, and with certain proportions will explode.

Ammonia solution has the characteristic smell and strongly alkaline reaction of the gas. It loses gas when exposed to air, and if heated to boiling, the whole of the gas can be expelled. In many cases the solution behaves as if it contains *ammonium hydroxide*  $NH_4OH$  ( $NH_3 + H_2O = NH_4OH$ ), and when added to solutions of metallic salts, precipitates the hydroxides of the metals.

EXPERIMENT 105.—To a solution of ferrous sulphate add some ammonia. A greenish-white precipitate of ferrous hydroxide,  $Fe(OH)_2$ , is formed.  $FeSO_4 + 2NH_4OH = Fe(OH)_2 + (NH_4)_2SO_4$ .

EXPERIMENT 106.—Treat a solution of ferric chloride in the same way. A brown-red precipitate of ferric hydroxide is formed.  $6NH_4OH + Fe_2Cl_6 = Fe_2(OH)_6 + 6NH_4Cl$ .

(To be continued.)

FIG. 26.

## Liverpool International Exhibition.

### DETAILS UP TO DATE.

(By Our Special Correspondent.)

I BELIEVE that I am the first to give a complete synopsis of the Liverpool International Exhibition, bringing all the details of the scheme fully up to date. No further introduction is needed, I think, to the rather lengthy article which follows.

Nearly all the arrangements for the show are definitely settled. The hanging of the frames (upwards of 1,500) has commenced and is proceeding briskly under the supervision of Mr. William Tomkinson, a Vice-President of the Liverpool Society. By Friday next, 6th March, everything will be in apple-pie order for the opening ceremony, which will be at once interesting and imposing. From then until Saturday, 4th April, the magnificent suite of rooms of the Liverpool Walker Art Gallery will be a scene of bustle, lectures, limelight demonstrations, and the rest of the functions attaching to an exhibition of this character.

Surprising energy and enthusiasm have been thrown into the work of organising the show. Encouraged and stimulated by the interest taken in and the ultimate success of the 1888 venture, the executive of the present exhibition have worked assiduously and arduously for several months to command a triumph in 1891. Special efforts have been made to direct attention to the extraordinary development of photography during the past year or two, and to encourage further advances in matters of photographic invention and artistic skill. To these ends the generous and hearty support of the best workers in photography in the United Kingdom have not been invited in vain, and in addition the Exhibition Committee have been enabled to collect from amateur and professional workers in various parts of the world one of the largest and finest displays of photographs ever shown. Contributions from the United States, France, Australia, Germany, India, Austria, Italy, Spain, and other countries are embraced in the unique collection, some of these being the work of gentlemen acknowledged as masters *par excellence* in the photographic world.

As finally determined, the order of procedure during the month's run of the exhibition will be:—

Friday, 6th March:—Dinner, Alexandra Hotel, Dale Street, 5 o'clock. Council, Committee, Judges, etc.

Friday 6th March:—Opening ceremony, 8 o'clock (evening dress.) Season tickets only and invited guests.

Saturday, 7th March:—From 10 a.m. to 7 p.m., specially reserved private view for country residents unable to be present at opening ceremony. Open to season ticket-holders only and their friends on payment of 2s. No invited guests.

High-class musical recitals (instrumental), at intervals from 2 o'clock to 5 o'clock.

Seven o'clock, the galleries will be open to the public; admission, 1s. Two lime-light demonstrations.

This forecast of the procedure on the first two days may be supplemented as follows. Two illustrated lectures or demonstrations will be given each evening, one at 8 o'clock and the other at 8.30. This arrangement, it is hoped, will obviate over-crowding at either of the meetings. The gentlemen who will officiate have been carefully selected, and all are thoroughly qualified as lecturers and demonstrators. Among them are:—

Mr. Paul Lange (Liverpool):—(1) A Tour in Norway. (2) The Wonders of Iceland, with personal adventures, and embracing 100 photographs now shown for the first time.

Mr. George Thompson (Liverpool):—(1) Rambles along the Riviera. (2) Up the Mediterranean, illustrated by 120 slides taken by the lecturer.

Mr. E. M. Tunstall (Liverpool):—Holiday Rambles at Home and Abroad.

Mr. W. Tomkinson (Liverpool):—The Adventures of Messrs. Camera, Tripod, and Snapshot, Members of the Black Art Club.

Mr. Fred Clibborn (Liverpool):—From the Mersey to Venice on a "Cunarder."

Mr. J. Lirrell Brown (Liverpool):—From Cairo to the Cataract.

Mr. S. G. Harris-Dearle (Liverpool):—(1) Stately Homes of England. (2) The "Moors" in Spain and Africa.

Mr. John Hargreaves (Liverpool):—The Hundred of Wirral.

Mr. C. W. Hastings (London):—The Prize Sets in AMATEUR PHOTOGRAPHIC Competitions.

Mr. Gambier Bolton (London):—Wild and Domesticated Animals, photographed and described by Mr. Bolton (as exhibited at Windsor to Her Majesty the Queen by special command).

Mr. J. A. Sinclair (London):—A Scamper across Normandy.

Mr. Thos. Brownrigg (Surrey):—Foreign and Home Scenery and Antiquities, with illustrative anecdotes and experiences. Two lectures—foreign and home.

Mr. A. R. Dresser (Kent):—On the Uses of the Hand-camera; slides, all from hand-camera negatives, viz., views, marine studies, dog studies, interiors, flash-light photographs, etc.

Mr. J. Devonport (Manchester):—Holiday Rambles.

Mr. J. W. Wade (Manchester):—Hand-camera Work.

Mr. J. Pattison Gibson (Hexham):—Northumberland, its Antiquities and its River Scenery, illustrated by upwards of 100 lantern slides by J. P. G.

Mr. Lamond Howie (Eccles):—To Ober-Ammergau and Back in 1890, illustrated by 120 slides, photographed by the lecturer. Given for the first time.

Mr. Christopher Naylor (Kerry, M——):—A Tour Round the World.

Messrs. Archer and Sons, Lord Street, Liverpool, have been entrusted with the lime-light and lantern work. Special lenses adapted for the highest possible perfection will be provided, and every arrangement made for the proper display of transparencies.

It will be seen from the above list that the Committee intend to get through some very entertaining and instructive work during the Exhibition. The refreshment department has been entrusted to Mr. L. Cottle, a noted local purveyor.

Naturally the Committee are highly gratified with the preliminary work achieved, and they look forward to the final success of the undertaking with confidence. They feel that in Captain Abney and Messrs. J. Gale, H. P. Robinson, A. W. Pringle, J. P. Gibson, and G. Watmough Webster, the adjudicators selected, they have an eminent jury whose decisions will be received with unanimity, and than whom they could not have made a better choice. The decks are thus cleared, or nearly so, for perhaps the best and most comprehensive photographic exhibition yet held anywhere. Financial and artistic success are alike assured. The gentlemen of the Executive responsible for this auspicious state of things are—Mr. Paul Lange, President; Mr. William Tomkinson, Vice-President; Mr. T. S. Mayne, Honorary Secretary; Mr. A. F. Stanistreet, Honorary Treasurer; and Mr. A. J. Cleaver, Colonel C. O. Ellison, and Mr. P. H. Phillips, Members of the Council.

In a note next week I hope to give a bird's-eye view of the half-dozen rooms comprising the Exhibition galleries, with a few remarks in advance on the general character and appearance of the exhibits, apparatus, etc.

**Sensitised Paper.**—Mr. Otto Scholzig, of 31, Binfield Road, Clapham Road, London, S.W., asks us to state that, in consequence of the continued fall in price of silver, he has decided to reduce his price of sensitised paper to the same level as it was before the rise in silver took place.

**Advertising.**—Mr. H. C. Jones, of 44, Packington Street, N., asks us to state, "that those gentlemen who do not receive an answer to their communications referring to the 'half-plate instantograph,' etc., which I advertised in your paper last week, are not to attribute it to any lack of courtesy, but to the fact that I have received so many letters that I am unable to spare the time to reply to all of them."

**Celloidin Paper.**—The new positive paper, analogous to aristotype paper, is treated in the same manner. It is rather sensitive, tones rapidly (ten to twelve minutes) in a combined bath, and only requires to be washed for half an hour. Its price is not high, and its use of the easiest. Make the print rather strong, then on coming from the frame plunge it in the following toning and fixing bath:—

Distilled water	...	...	...	...	2 litres.
Hyposulphite of soda	...	...	...	...	500 grammes.
Rhodammonium, sulphocyanide of ammonium	...	...	...	...	55 "
Acetate of lead	...	...	...	...	20 "
Chloride of gold in solution 1: 200	...	...	...	...	150 "
Pulverised alum	...	...	...	...	15 "
Citric acid	...	...	...	...	15 "
Azotate of lead	...	...	...	...	20 "

The prints acquire in this bath, which should only be used a few days after its preparation, a yellowish colour, then tone rapidly, if the temperature is from 15 degs. to 18 degs. Centigrade. Heat increases the reaction, and gives the finest tones; cold retards it. The solution in use is carefully kept in a bottle, which is filled up after each operation with some fresh solution. The other operations are the same as for albumenised paper.—*Les Annales Photographiques.*

## Notes from the Liverpool Centre.

(By our District Editor.)

MR. H. E. BURN, the worthy and accomplished President of the Walton Society, read a very interesting paper on "Photography," to the members and friends of St. John's (Walton) Literary and Debating Society a few nights ago, giving a concise history of the progress of photography, and the connection of the art-science with astronomy. A number of excellent studies were shown by limelight, the former being the work of Mr. Burn and Mr. Park. I hear that the lecture is likely to lead to a number of recruits for the already large and influential army of photographers.

Another good lecture was that of a Mr. Arthur Evans, of Haydock, who at Waterloo last Saturday discoursed on "Ober-Ammergau, and its Passion Play." Numerous limelight illustrations were shown. Vice-Chancellor Rendall, Principal of Liverpool University college, presided. It is in connection with a class at this college that Dr. Kohn's lectures on "Chemistry and Photography" are being given.

Probably most readers of the AMATEUR PHOTOGRAPHER will have noticed the following paragraph in a recent issue of the *Daily Graphic*:—"Different persons will naturally receive with different emotions the news that a process has been discovered for the photographic reproduction of all the colours in the spectrum. When we go to have our portraits taken, few of us are disposed to insist upon a too servile realism; and it is generally thought to be the chief charm of the photographic art that it throws a false glamour over the pale faces of valetudinarians and the rubicund noses of the bibulous. In the country, where the roses bloom upon the buxom cheeks of the inhabitants, the new invention will no doubt be welcomed cordially; but in the towns, where the fogs and the underground railways act upon the liver, and the liver re-acts upon the complexion, one is by no means so sure of its reception."

The subject is attracting much critical attention here among nearly all classes of workers in photography.

On Thursday, this week, the members of the Liverpool Society had much to engross their attention at the ordinary monthly meeting. Eight new members, including one lady, were to be elected, and Mr. J. A. Sinclair, recently removed from this city to London, was to be made an honorary member of the society. Among the novelties down for exhibition was Messrs. Marion and Company's new hand-camera for 1891, "The Radial." Dr. B. Jumeaux, of the Manchester Amateur Photographic Society, contributed a paper on "Eikonogen v. Pyro." In consequence of the exhibition, it has been decided not to hold the usual monthly meeting in March.

Coming to exhibition matters, I may state that invitations have been sent out to a number of gentlemen to attend a dinner at the Alexandra Hotel, on Friday, 6th March, when the judges and Council will be present. Season-tickets were ready for sale last Monday. Special invitations for the opening night will be sent to every member of the Liverpool Society for self and friend; if extra invitations are required, members are requested to communicate with the Secretary, Mr. T. S. Mayne. It has been arranged that the opening ceremony shall take place at eight o'clock on the 6th ult., when the entire suite of rooms at the Walker Art Gallery, including the permanent collection of pictures, will be open to inspection.

## Notes from Paris.

ANY photographer who has ever had a parcel of sensitive plates opened by an obstinate official, and consequently spoilt, at a foreign custom-house, will bless the Syndicate of Photographic Apparatus Makers of Paris for the polyglot tickets which one of its members has just brought out. The tickets are printed in 22 languages, and bear an inscription, which in English runs, "To be kept from daylight. Not to be opened except by the person to whom it is addressed." Two of the tickets—Volapuk and stenography—do not appear to be of much use, for Volapuk is extinct, or at best only used by a few "cranks," and anyone who can read French in shorthand must surely be able to read it in print. Still, the others are useful, and one or more of them affixed to a box of plaques might have the desired effect of preventing various foreign officious officials from opening the package,

and so ruining the contents, though, from what I know of foreign custom-house officers, the knowledge that they were doing a serious mischief would in many cases only add a zest to their enjoyment.

The *New York Herald* (Paris edition) published a deliciously naive article on photography in colours a few days ago. The writer thought it necessary to inform photographers that if they were under the impression that they would ever be able to take a coloured negative, and strike off coloured pictures from it, they were labouring under a delusion, and might as well hope to obtain motion without force. It is absolutely impossible, even for the *New York Herald*, to know all that science may one day achieve, but I take it for granted that photographers would be content for the time being if by some cheap and easy process they could fix natural colours on a positive plate.

## Quarterly Examinations in Photography.

**Question 13.**—*Explain the chemistry of fixing. Is there more than one variety of fixing bath? Give formulae, and state advantages and disadvantages of each.*

ANSWER.—Fixing is the removal of any sensitive salt unacted upon by light or by the developer. This is usually done by the solvent action of sodium hyposulphite, which we take as an example.

When  $\text{Na}_2\text{S}_2\text{O}_3$  is added to a silver salt, two salts are formed;

being (1) double hyposulphite of silver and sodium, and (2) hyposulphite of sodium and silver.

The first salt is soluble in  $\text{Na}_2\text{S}_2\text{O}_3$  (not quite in  $\text{H}_2\text{O}$ ), therefore excess of  $\text{Na}_2\text{S}_2\text{O}_3$  should be used, and a second bath is to be recommended for this. When this salt is completely dissolved out, the plate, film, etc., is no longer sensible to light, and needs only careful washing to render it permanent.

Several fixing baths exist; they are given in order of superiority generally:

1. Hyposulphite of sodium,  $\text{Na}_2\text{S}_2\text{O}_3$ . (Advantages: Cheap, very soluble in water, not too powerful, does not destroy half-tones. Disadvantages: Difficult to eliminate.)

2. Cyanide of potassium, KCN. (Advantages: None over 1. Disadvantages: Expensive, too powerful, destroys half-tones, and is a deadly poison by absorption and otherwise.)

3. Sulphocyanide of potassium, KCNS.

4. Sulphocyanide of ammonium,  $\text{NH}_4\text{CNS}$ . (Advantages: None over 1 or 2. Disadvantages: Expensive, fixing power not good.)

5. Magnesium chloride,  $\text{MgCl}_2$ . (Advantages: None. Disadvantages: Expensive, not easy to control in action. BIARRITZ.

**Question 14.**—*How would you intensify a plate with very dense high lights and very weak shadows?*

ANSWER.—For intensification of a negative with very dense high-lights and very weak shadows, the following is a formula by Dr. Eder:—

The negative is soaked in the following solution until thoroughly bleached, the image being converted into chloride of silver—

Hydrochloric acid	...	...	...	...	3 c.c.
Bichromate of potassium	...	...	...	...	1 gram.
Alum	...	...	...	...	5 "
Distilled water	...	...	...	...	100 c.c.

When bleached, the image is washed in running water until the film shows no yellow tint. The negative is then treated with an old quinol developer; if the action of this is stopped before the high-lights are fully reduced, the plate again fixed and washed, a more harmonious negative will be the result. E. B.

**Question 15.**—*Describe the method of developing bromide paper with ferrous oxalate?*

ANSWER.—The ferrous oxalate developer is generally prepared by mixing saturated solutions of ferrous sulphate and potassium oxalate in the proportion (for the normal developer) of one part of the former to five of the latter. The iron should always be added to the oxalate, as, if mixed the other way, a precipitate is formed; to every ounce of the above solution about  $\frac{1}{2}$  gr. of potassium bromide should be added. The developer must be distinctly acid, and may be acidified with citric or sulphuric acids. Prior to development the paper should be soaked in clean water for a few minutes. The water is then poured off, and the developer (prepared as above) poured on with an even sweep. The dish is then gently rocked, and in a short

time the image will begin to appear, and as soon as the desired result is obtained, development must be stopped, and the print transferred to the clearing bath. Here is the equation representing the chemical change brought about by development:—

If there is insufficient contrast in the negative, it may be increased in the print by strengthening the developer, that is, by increasing the proportion of ferrous sulphate; but if, on the other hand, there is too much contrast in the negative, it may be considerably reduced by using a weak developer, that is, a developer with a small proportion of iron. An old developer, strengthened with a little new, gives very vigorous results.

SUNESIS.

Papers have been received from, and marks awarded to: A. C. S., Developoid, Worfield, Lindem, R. C. M., Electra, Biarritz, Sunesis, E. B., C., Spain.

## Societies' Meetings.

**NOTE.**—In this column the Editor can of necessity only give a brief summary of the proceedings. Papers read before societies will appear in the PHOTOGRAPHIC REPORTER, and the Editor of the REPORTER will be glad to receive reports for insertion as early as possible after the meetings have been held.

**Belfast.**—The first of a series of limelight exhibitions in connection with the Y.M.C.A. Camera Club was given on the 6th inst. in the hall of the Y.M.C.A., Wellington Place, before a large audience. The exhibition consisted of the 1890 prize slides, an interesting descriptive lecture being given by Mr. Edward Riddell. These exhibitions will be continued on March 9th and 16th.

**Birmingham.**—A meeting of the section of this Society which has undertaken to survey, photographically, a part of the county of Warwick, was held on the 19th inst., Mr. Jethro A. Cossins, the well-known architect and archaeologist, being in the chair, and a large number of photographers present. The officers of the section for the coming year were elected as follows:—President, J. B. Stone, J.P., F.L.S., etc.; Vice-President, J. A. Cossins; Treasurer, S. G. Mason; Secretaries, Messrs. J. H. Pickard and W. Jerome Harrison, with a Committee of eight members. It was resolved that the work of the coming season should be confined to the Hundred of Hemlingford, which forms the northern part of Warwickshire, including Birmingham, Tamworth, Nuneaton, Solihull, etc. The six-inch ordnance map is to be the basis of the survey, and each member was requested to undertake one of the sheets of this map, with a view to securing a photograph of every prominent, remarkable, or historic object contained in that sheet. It was further resolved that each worker should "report progress" by the end of June.

**Blackburn.**—An exhibition of the AMATEUR PHOTOGRAPHER Prize Lantern Slides was given in the Society's rooms on the 13th inst. Those on Mawson plates, developed with hydroquinone, gave the most satisfaction, and the architectural subjects were considered the best.

**Brechin.**—The Photographic Association closed the lectures at the Mechanics' Literary and Scientific Institution for the session with an illustrated lecture by Mr. T. C. Hepworth, F.C.S., "All About a London Daily." The lecture was fully illustrated by a series of lantern slides, showing the progress of an illustrated newspaper from the rag store and paper mill to the finished production on the breakfast-table. At the close of the lecture nearly 100 slides of various views throughout Scotland and South Africa were exhibited, the work of the members of the Association.

**Brixton and Clapham.**—On the 21st inst., there was a special lantern evening, after which a flash-light demonstration was given by Messrs. Bartrop and Kent.

**Cornish.**—Mr. Henry Tonkin gave an interesting lecture on "Flashlight Photography." The illustration was the taking a photograph, developing, and printing on paper. But several instantaneous photographs, lent by the Editor of the AMATEUR PHOTOGRAPHER, showed still further what may be done in this direction.

**Colchester.**—The annual meeting of this club was held on the 23rd inst., the Rev. C. L. Acland, M.A., President, in the chair. The executive were entirely reappointed, with the addition of Mr. Morton Mathews as a member of the Committee. The financial report showed a balance in hand. The year's work, as detailed in the report, was read. The popular Mayor of Colchester, Lent J. Watts, Esq., was elected a member of the club. The services of the Honorary Secretary, Mr. Harry Wright, were cordially acknowledged. It was announced that the Gresham Professor of Astronomy would again lecture to the club, with photographic illustrations, on Monday, March 16th. Mr. J. C. Thurstone exhibited to the members the compact enlarging and reducing camera made by Messrs. Lancaster and Son, and another member, Mr. G. W. Baskett, exhibited a whole-plate

portrait taken by flash-light on a Castle plate; an autotype portrait printed by flash-light, and a view printed out on Scholzig's matt silver paper in 30 seconds by magnesium light.

**Croydon.**—The 20th inst. was a lantern evening, the President being in the chair. Mr. Low Serjeant passed a very interesting series of slides through the lantern, entitled "Round About Exmoor." The whole of the pictures were taken on films, and the slides were of a high order. Mr. Sarjeant operated the lantern, and Mr. Sheldon, who accompanied him on his tour, very ably gave a short description of each slide as it was passed through the lantern, coupled with numerous amusing incidents that occurred on the way. The next ordinary meeting will take place on March 6th, and lantern night March 20th.

**Devon and Cornwall.**—The members recently received from a society at the Cape of Good Hope a batch of photographic slides of Cape views, which were much appreciated and admired. On the 16th the members met and selected some eighty slides of English scenery, local and general, for transmission to the Cape society. A large number of views, contributed by several of the members, were shown by means of the oxy-hydrogen light, and included some very beautiful views of Flete House, Maristowe, Exeter Cathedral, seascapes at Newquay, Torquay, and picturesque scenes of other places of interest in the two counties. Mr. Percy Pearse was unanimously elected a member of the club.

**Dukinfield.**—The annual exhibition was held on the 13th and 14th inst., in the Co-operative Hall. The room itself was most picturesquely festooned with delicate coloured drapery. From eight o'clock on Friday evening to one on the following morning a large gathering of about 150 went in for dancing. At intervals Mr. W. H. Shirley and Mr. Woodville, of Manchester, gave songs and recitations. Mr. Arthur Sampson's orchestral band supplied the necessary music. Attention was first drawn to a collection of large prints in frames, by Mr. J. Jenkinson, and also a collection of pretty cloud studies and seaside scenes, 12 by 10, by Mr. T. Glazebrook, whilst Mr. W. Chadwick had on view a series of whole and half plate frames. The President exhibited the results of his labours in photography by the instantaneous process. There were scenes from the Dukinfield streets at the time of the whitsuntide processions, views from Belle Vue, Morecambe, etc., the representation of a milk-cart in a snow-storm, and various other interesting sights. One frame, containing ten instantaneously-taken pictures, was awarded the Silver Medal in the AMATEUR PHOTOGRAPHER Lantern Slide Competition. He had also a few enlargements of the little sketches caught by the hand-camera, which included a view of the old mill at Ambleside, Mr. W. Leigh had two frames of pretty sketches, and Mr. H. Broadbent had also a good show, as well as Mr. J. Winterbottom. Messrs. A. and J. Sampson exhibited a number of prints, which included a group of the portraits of the winners of the gold and silver challenge shield belonging to the 3rd Manchester Regiment. Mr. R. Mathews was represented by a picture of the Roman bridge at Marple. Dr. Hamilton stood well to the front with some picturesque scenes from Switzerland in platinotype, and there was close by a large frame of bromide prints by Mr. W. Greenwood. On the table there were laid a goodly and well-assorted selection of stereoscopic slides, belonging to Dr. Hamilton, Messrs. T. Borse, and T. Glazebrook, as well as transparencies and lantern slides by Messrs. J. Winterbottom, T. Glazebrook, W. H. Shirley, W. Chadwick, and T. Borse, and the latter had some whole-plate enlargements. Mr. W. Jenkinson was represented by whole-plate silver prints, which contained amongst them a picture of last year's exhibition at the Co-operative Hall, neatly executed. Messrs. R. Deakin, J. Leach, and J. W. Hadfield were well represented, the latter with a flashlight photograph of Mr. Glazebrook, and photographs of bicycle champions taken at the Ashton sports. An enlarged picture of Haddon Hall, by the cyanotype process, by Mr. J. T. Lees, and coloured to obtain a moonlight effect, was very pretty. Mr. Jenkinson gave an excellent lime-light lantern entertainment on Saturday. It may be stated that altogether there were 400 prints and 270 transparencies exhibited.

**Ealing.**—There was a largely-attended meeting of the members and their friends on the 19th inst., evidently attracted by the announcement that the AMATEUR PHOTOGRAPHER 1890 Prize Slides were to be exhibited. The chair was taken by the President (Mr. H. W. Peal). The Society unanimously resolved to support the petition which is being prepared for presentation to the railway companies on the subject of cheap fares. The question box contained these questions: (1) Is it always advisable to use very rapid plates for instantaneous work; cannot slow plates be used in some cases? (2) What was the cause of the red appearance of some of the slides at the last lantern meeting? Both these questions were spoken to by the President and Mr. Whiting. The Prize Slides were then exhibited, and were much admired, the optical lantern manipulated by Messrs. C. N. Neal and T. Simpson doing full justice to these artistic and clever productions. Several slides by the following gentlemen were also exhibited: Mr. Harry M. Elder, G. W. Slatter, Dr. Gibbons, Mr. Whiting, and the President. The next meeting

will be on the 5th March, when Mr. R. Whiting will read a paper on "Intensifying and Reducing."

**East Southsea.**—The fortnightly meeting of this Society took place on the 3rd inst., it being members' lantern night. The attendance included many visitors. About sixty slides were shown and were much appreciated by those present. The slides, which were all the work of members, included some splendid views of the Peak district of Derbyshire, some of which were accepted and published by the *Daily Graphic*. Mr. H. Hickey was unanimously elected a Vice-President. The first exhibition of this Society was held on the 17th inst., in place of the ordinary fortnightly meeting, and was well attended by a large number of members and their friends. The pictures sent in, which were as varied as they were numerous, were well criticised and admired by those present, one of the chief objects of attraction being a fine panel portrait, just received, of General Sir George Willis, K.C.B., the Society's patron. Mr. Israel Harding, V.C., R.N., exhibited a splendid collection of whole-plate photographs of Egypt. Other leading exhibitors were Messrs. Cleminson, Fielder, Wright, Winslade, Green, Parke, Fogwell, Misslebrook, Gower, etc. Mr. J. J. Thornton has been elected an honorary member.

**Enfield.**—A good number of members assembled on the 18th inst., when Mr. J. Howson gave a very interesting demonstration with "Alpha Paper, Special Lantern Plates, etc." He exposed three plates, two to ordinary gas-light, giving 15 and 20 secs., and one to the light of an ordinary wax vesta as long as it kept burning. They were then placed in the Ilford hydroquinone developer together, with the result that it was impossible to distinguish one from another when finished. The beautiful specimens brought by the demonstrator were much appreciated by those present. Five new members were elected.

**Epping Forest.**—This Society held its first public display on the 18th inst., in the Fillebrook Lecture-hall. The proceedings opened with an exhibition of members' work, which was inspected with much interest by a large company of visitors. There were some 300 pictures, many of them being *Boys' Own Paper* competition prints lent by the Editor, and others shown by the Stereoscopic Company. The Rev. J. Bradford then gave a practical and interesting description of the process of taking a photograph, from the unexposed plate to the finished print. An excellent selection of slides was then shown, many of the local views by members being especially appreciated. Messrs. Mawson and Swan, the Britannia Works Company, and the Stereoscopic Company also lent some fine slides, which showed the splendid qualities of their respective plates. The Society scored a success which it is hoped will lead to a large increase in its membership. At the next meeting, on March 16th, Mr. H. W. Bennett will read a paper on "Negative Making." The Hon. Sec. is Mr. J. W. Spurgeon, Drayton Villas, Leytonstone, Essex.

**Formby.**—The ordinary meeting of this Club was held on the 23rd inst. The subject for the evening was "Bromide Enlargements" with the enlarging camera and magnesium ribbon. The Hon. Secretary (Mr. S. R. Hunt) succeeded in turning out a creditable picture, enlarged from half-plate to 12 by 10.

**Glasgow.**—The usual monthly meeting was held on the 16th inst., Mr. John Morison, jun. (President), in the chair. Six new members were elected. Professor Barr, of the University, showed and explained an ingenious apparatus of his own invention for photographing book illustrations and diagrams, so that they might be projected on the screen by means of the optical lantern, thus saving the expense and labour of drawing elaborate cartoons for lecturing purposes. The apparatus was examined by the members, and the President made two enlargements from hand-camera negatives by means of the lime-light lantern, and Mr. V. L. Alexander showed about thirty slides through the lantern, illustrating a tour to Stornoway. This meeting was one of the largest of the session.

**Glenalmond.**—At the ordinary fortnightly meeting held on the 21st inst. Mr. E. H. Cunningham Craig delivered an interesting address on "Lantern Slide Making and Painting." Messrs. C. C. Robertson, Glasgow; A. M. Dykes, F. Moore, and F. H. Harrison were enrolled as members.

**Hereford.**—A meeting was held at the Mansion House. The Rev. W. Bowell, one of the Vice-Presidents of the Society, presided. Mr. W. E. Haines exhibited a new lantern which has recently been purchased for the Society, with the view of encouraging the taking of lantern slides, and by its means a number of views of scenery in Switzerland, taken by Mr. Watkins, were shown. It was also resolved to purchase a screen for use in connection with the lantern.

**Holborn.**—The 11th inst. was a lantern evening. On the 20th inst. Mr. Lowe in the chair, the Secretary read a communication from Mr. L. M. Biden with respect to a meeting at the rooms of the Photographic Society of Great Britain, and Messrs. Smith and Golding were elected to represent the Holborn Camera Club on that occasion. A demonstration on "Enlarging on Bromide Paper," by Messrs. Smith and Benest, was then given, Mr. Benest using Lancaster's enlarging apparatus and Ilford paper, and Mr. Smith used the

Club lantern, and an arrangement of his own for using his own lens, making trial exposures on slips of Ilford, Fry's, Mawson and Swan's, and Eastman papers, and afterwards exposing a sheet of each, giving the exposures found necessary, and both gentlemen getting good results in each case, using ferrous-oxalate developer. The Club exhibition and cinderella dance will be held at Anderton's Hotel, Fleet Street, on Saturday, March 7th.

**Lantern Society.**—An admirable series of lantern slides attracted an appreciative audience to 20, Hanover Street on the 23rd inst. Commander C. E. Gladstone, R.N., manipulated the lantern, and added to the interest of the exhibition by explanatory descriptions of the slides. The first set which was shown on the sheet comprised some hand-painted slides by Mr. Evans, which were appreciated for their artistic excellence. The venerable appearance of Canterbury Cathedral has been well delineated by Mr. Evans, the distance effect in the crypt being specially good. A slide representing the organ screen was applauded, the detail being extremely clear. Some landscapes on the Thames, including a beautiful view of Mapledurham, followed. The negatives for these slides were all taken in a quarter-plate camera, and most of them on Mawson's plates. Mr. Hall Caine would have enjoyed an excellent view of the Isle of Man, which was taken with fixed-focus lens. A slide from a photograph of Pangbourne was very much admired. The negative was taken on the 5th of November last, but no firework display gave variety to the landscape. "Sunset at Mapledurham" was the title of a fair representation of one of the prettiest spots depicted by Mr. Evans. His view of Trafalgar Square, including a back view of Mr. Hamo Thornycroft's newly-erected statue of General Gordon, was not so well chosen. The wonderful slides by Messrs. Carpenter and Westley, where the artist has drawn the subjects on bare glass, were next shown, and, as usual, excited great admiration. Some Egyptian interiors were rendered in the most vivid manner. One slide gave the impression of a five o'clock tea party taking place under the shadow of a sphinx. Views of Smyrna and Burgos were very good, slides representing the cathedral at Burgos receiving loud applause. The latter were drawn upon a surface of three inches diameter, and were remarkable for their fidelity. Venice, Stratford-on-Avon, and an unfinished slide of the interior of St. Paul's, at Rome, completed this series. The contrast between the hand-painted slides of fifty years ago and the slides of the present day was very apparent when the next series appeared on the sheet. These were modern subjects lent by Messrs. Newton. In some cases these slides were very highly coloured, and comprised not a few angelic subjects. The eyes of these latter were apparently blackened, and the style of the slides was slightly exaggerative. Those depicting the celebrated pictures, "The Rock of Ages," were better appreciated. The fourth series was formed of coloured photographs by Mr. Hicks. These were originally collected for the purposes of a lecture delivered by that gentleman in 1879 at the Polytechnic. They are now for disposal with accompanying MSS., and are certainly of a highly popular nature. Very excellent views of Portugal were selected by Commander Gladstone as samples of the work of Mr. Hicks. After a brief interval the exhibition was continued, and included many other interesting specimens of lantern slides, which met with approval from the audience.

**Leeds.**—On the 15th inst. the second of the series of elementary lectures was given by the Hon. Secretary (Mr. S. A. Warburton), his subject being "Development." Previously to entering upon the subject of actual development, Mr. Warburton stated that it would be well to trace the sensitive plate from its package to the developing dish. In the first place he advised the "backing" of all plates with burnt sienna backing, in order to prevent halation; and with respect to exposure, a little experience gained by exposing a couple of dozen plates upon, say, half a dozen different subjects, making three or four exposures of varying lengths of time upon each subject, carefully noting the conditions as to plate, subject, stop, light, etc., and after development making a note of the result, was worth all the exposure tables yet invented. An exposure book of this kind formed a record of actual experience which would, with constant additions, in time become invaluable. Mr. Warburton then proceeded to develop a number of previously exposed plates by means of the ferrous-oxalate, hydroquinone, and pyrogallol acid developers, stating that for his own use he greatly preferred the latter, used with ammonia, and urged those present to make themselves thoroughly acquainted with this developer as possessing great power, and being the most under control. The operations of intensification and reduction were afterwards dealt with.

**Liverpool (Y.M.C.A.)**—On the 18th inst. Mr. R. S. Archer gave his lecture entitled "My Trip to Western Norway," Mr. J. F. Stone presiding. The views were excellent, and were frequently applauded by the members and friends. Mr. Jno. C. Lee manipulated the lantern.

**Loughborough.**—On the 20th inst. the Photographic Section gave its annual lantern slide exhibition before the members of the parent Society. The Rev. C. W. Vick described the slides (over two

hundred in number), which were projected on to an 18 ft. screen by a powerful lime-light lantern, manipulated by Mr. W. Clarke. The following members contributed slides—The President (J. B. Colgrove, M.A.), the Vice-President (Ald. W. C. Burder), Messrs. A. D. Bartlett, Underwood, Riley, Wright, Handford, Dr. Parke, and the two Hon. Secs., Messrs. W. Clarke and Mr. T. Tucker. At the conclusion an experiment was attempted to illustrate development. A tank with glass slides was fitted into the stage of the lantern, and a plate exposed, developed, and then projected upon the screen. The result was a very good portrait of the Mayor (Ald. Bumpus, J.P.).

**Louth.**—The annual meeting was held on the 16th inst., the Rev. C. W. Whistler, President, in the chair. The annual report showed a membership of fifty, including fourteen ladies, and a good balance in favour of the society. Some alterations in the rules were made, and the following officers were elected for the ensuing year:—President, Captain Ranshaw; Hon. Sec. and Treasurer, Mr. S. Francis Clarke, L.D.S.; Assistant Sec., Mr. Herbert Bentley; Committee, Rev. J. M. Coates, Rev. C. W. Whistler, Mr. C. James, Mr. A. R. Yeoman, Captain Fowler, and Mr. Walter Shephard.

**Morley.**—The members had a lantern evening on the 18th inst., when there was a large attendance of members and friends, Messrs. Atkinson, Smith, and Tomlinson contributing the slides, many of which elicited great admiration. Tuesday, March 3rd, is set apart for the exhibition of AMATEUR PHOTOGRAPHER prize slides.

**Newcastle-on-Lyne.**—The ordinary monthly meeting was held on the 20th inst., Mr. James Brown in the chair. The American lantern slides were shown on the screen, and the AMATEUR PHOTOGRAPHER Prize Stereoscopic Competition Slides were also on view. Both series were appreciated by those present. Six new members were elected.

**North Kent.**—A soirée in connection with the above Society took place at the Anglo-Saxon Hall, Gravesend, on the 19th inst. The AMATEUR PHOTOGRAPHER Monthly Competition Prints No. 19 were on view. There was an exhibition of lantern slides lent by members.

**North London.**—The general meeting was held on the 17th inst., Mr. A. Mackie in the chair, this being the evening on which the long-talked-of lantern slide competition was to take place. Two lanterns had been arranged side by side by Mr. Bishop; two discs were thus thrown upon the screen side by side on which the slides were to be shown. Four quarter-plate negatives, each presenting some difficulty, had been kindly selected and lent by the Chairman some months beforehand, and these had been in the possession of each member who wished to take part in the competition, for one week. Lantern slides were to be made from them on any plates and by any method or developer which the member might choose to adopt. Clouds were to be added or not at the will of the competitor. No prizes were offered, but the honour of securing a place in the competition seems to have been sufficient incentive, for no less than thirteen sets of slides were sent in, the vote for superiority being taken by show of hands, and the slide adjudged second best being quickly removed from the screen, another taking its place, perhaps, in its turn, to pale before the other. Mr. Parfitt took first place with Mawson's plates by contact, developed with pyro, ammonia, and carbonate of ammonia, standing second in sets 1 and 3, and first in set No. 4. These slides were of a beautiful warm-brown tone. Mr. Smith with a wet collodion plate in camera by daylight and afterwards toned, took first place in No. 2 set. Mr. Grover with a Cowan's chloride plate, developed with hydroquinone, and afterwards toned with gold, took first place in No. 1 set. Mr. Dando with a collodio bromide plate took second place in No. 4 set. Mr. Farmer with a slide on Thomas's plate by contact, developed with pyro and ammonia, took first place in set No. 3, and Mr. Kew with one of the new Ilford plates for black tones, by contact, developed with hydroquinone, took second place in set No. 2. In several of the sets there was little to choose between Nos. 1 and 2 slide. The Secretary announced that it had been found necessary to postpone the annual exhibition to March 17th, and therefore the meeting on March 3rd would be a technical evening, and Mr. Newman would give his paper on "High Speed Shutters" later on.

**North Middlesex.**—At the meeting on the 23rd inst., Mr. J. Saville in the chair, Mr. Lewis Medland exhibited his beautiful and interesting collection of slides, entitled "A Day at the Zoo." These were about 250 in number, and most of them had been taken under great difficulties, and in some cases even with danger; they were remarkably fine, wonderful definition and detail having been secured. The lecture afforded much sound information as to the structure and habits of the animals, and was enlivened with stories of Mr. Medland's adventures in South Africa and the plains and rocky deserts of Western America.

**Nottingham.**—The fortnightly meeting was held on the 16th inst., Mr. S. Wells, President, in the chair. Mr. Councillor Abraham Pyatt and Mr. Thos. Warwick were unanimously elected members. Mr. Howson, of the Britannia Works Company, gave a practical

demonstration on "Alpha Paper Printing," exposing and developing several prints. Mr. Howson also exposed and developed several of the Alpha lantern plates, and fully demonstrated the range of tone obtainable by prolonging, exposing, and developing. The society have had a most successful week in lantern-slide making, every evening being devoted to demonstrating; the plates used being Mawson and Swan's, Fry's, Edwards's and Thomas's, the results forming a nucleus for a loan collection for exchange with other societies. The usual vote of thanks brought a most enjoyable evening to a close.

**Paisley.**—The fifth annual exhibition of the above Society was opened in the Art Gallery of the Free Library and Museum on the 14th inst., and will remain open for a month. There is a large show of pictures, entirely the work of the members of the Society, and in a few of the classes the judges had a difficulty in making the awards on account of the close competition. Altogether, the work is of an order of merit sufficient to show that the members continue to make steady progress in the art, while in some instances the exhibits are remarkably good. The following are the awards:—In Class A, landscape and architecture, Mr. Matthew Morrison and Mr. Robert Ferrier were equal, while the frame by Mr. Alex. Thomson was highly commended. In Class B, for portraits or groups, in-doors or out-doors, the first and only award was given to Mr. A. F. M. Callum. The first prize was awarded to Mr. Alex. Thomson in Class C, for photographs taken during the Saturday afternoon excursions. In Class D, copies of engravings, etc., there was a very good competition. The first prize was awarded to Mr. Thos. H. Taylor, and the second to Mr. Alex. Kilpatrick. There was also keen competition in Class E for the Society's prize for marine and instantaneous work. The first prize (silver medal) was awarded to Mr. David B. Jack, and the second (bronze medal) to Mr. Robert Ferrier. In Class F, for lantern slides, first place was taken by Mr. James Mure, and second by Mr. Alex. Kilpatrick. The judges in the competition were Mr. T. N. Armstrong and W. B. Smith, Glasgow, and Mr. John Fullerton Merkworth.

**Richmond.**—At the meeting on the 20th inst. there was a very full attendance, Mr. Ardaseer in the chair. The award of Mr. J. B. B. Wellington on the recent competition in landscape photography was made known, and the batch of prints handed to the successful competitor, Mr. Ardaseer, Mr. C. Hussey not being sufficiently recovered to give his promised demonstration of the "Collodio Bromide Process." Mr. Cembrano filled the vacancy, and gave a practical illustration of the difference in tone which can be produced in gelatine lantern-plates, simply by varying the exposure. Using the same negative and same developer, he exposed and developed three plates, giving to the second four times, and to the third sixteen times the exposure of the first. An excellent slide resulted in each case, but the tone varied from a brown-black in the shortest exposed to a warm purple in the longest.

**Selby.**—At a meeting held on the 10th inst., the President (Mr. Rawling) in the chair, Mr. J. C. Thompson gave a most interesting account of "How to Enlarge" with the lantern, and also by means of an easel, etc., of his own invention, followed by a practical demonstration. The annual meeting was afterwards held. The question of having a room for meetings, and a dark-room was considered, but it was decided to adjourn the meeting for a fortnight, in the hope that a likely room would be found, and at which meeting there is to be an exhibition of lantern slides. It is intended to hold the meetings about once a fortnight, and some papers have already been promised. The Secretary, Mr. Atkinson (Churchyard, Selby), will be very glad to receive names of persons wishing to join.

**Staffordshire Potteries.**—The annual meeting of this Society was held on the 17th inst. The annual report, which detailed the work done for the past season, was read. It stated that the membership roll numbered thirty-four members, that fourteen new members were elected during the year, and that there was a balance in hand at the close of the year. The President, Mr. R. S. Burgess, was re-elected, The Mayor of Burslem, Mr. W. Woodall, M.P., and Mr. W. Burgess were elected patrons; Messrs. T. Blackshaw, E. B. Wain, and F. Bettany, Vice-Presidents; Mr. S. Crosse, Treasurer; and Messrs. J. F. Hewitt and F. C. Powell, Hon. Secs. A hearty vote of thanks were accorded to the officers for their services during the past season. The programme for the ensuing season was arranged. The Secretaries reported that at the March meeting Mr. Walley would give a paper on "Architectural Photography."

**Spen Valley.**—The last meeting was held on the 17th inst. Several subjects of current interest, notably M. Lippmann's discovery of photographing colours, were discussed. During the evening the President read an interesting and instructive paper on "Outlines of Photographic Optics," in which, after a preface on the pleasures of study, he described the law of refraction, and explained the properties of the various lenses and the utility of the stop. A discussion followed the reading of the paper.

**Sydenham.**—A meeting was held at the "Greyhound" Hotel

On the 17th inst., Mr. T. C. Cole in the chair. A memorial to the London and suburban railway companies in favour of cheap fares for photographers was laid before the club, and it was decided that the Secretary should sign same on behalf of the members. Mr. Zimmer then read a paper on "Platinum Printing." By the courtesy of the Manager of the Platinotype Company, he was able to give the members not only reliable information but also a new formula for developing. During the course of the evening he developed a number of prints, including one on paper ten months old with very good results, thus proving that with ordinary care the paper can be kept for a greater length of time than is generally supposed. Mr. Piggott remarked that warmer tones could be obtained by mixing a few drops of bichloride of mercury in the hot bath, and a general discussion by the members then followed.

**Toynbee.**—The meeting on the 19th inst. was a lantern evening.

**West Kent.**—The ordinary meeting was held at Bexley on the 18th inst., the President, Mr. Andrew Pringle, in the chair. Messrs. C. H. Lyster and J. P. Holmes were proposed as members under the new rule. Mr. Willis, of the Platinotype Company, was then called upon for his paper on "Platinum Printing," which was very much appreciated, some valuable hints being given. The next meeting will be held at the Station Hotel, Sidcup, on Monday, March 2nd.

**West Surrey.**—The third lantern-slide exhibition of the West Surrey Photographic Society was held at Crichton Hall on the 17th inst. About 200 members and friends were present, and about 350 slides were passed through the lantern. The slides were described

by Mr. Davison (the well-known and popular Vice-President of the Society.) Sets of slides were kindly lent by Messrs. Mawson and Swan, and the Fry Manufacturing Company, while Mr. Gale (the President) showed some of his masterpieces, greatly to the enjoyment of the company. Amongst others who exhibited were Messrs. Dixon, Berry, Tims, and Davison. The third annual exhibition of this Society takes place on March 12th, 13th, and 14th, at the above hall, when a most interesting display of pictures and lantern slides will be placed before the public.

**Wigan.**—The 19th inst. was a lantern night. The President provided the lantern. There were not very many slides shown, as only a few of the members are slide makers. The President showed some slides of the district, also a few of Somerset, including Wells Cathedral; Mr. Newman, several Scripture subjects, principally from Cassell's Doré Bible; Mr. A. Smith, a few comic slides; and Mr. F. Betley, slides of local and other scenery. Messrs. Arthur H. Tuer and J. Hodgson were proposed as members. The next meeting will be on March 5th, when the President, the Rev. G. F. Wills, will read a paper.

**Woolwich.**—The fortnightly meeting was held on the 12th inst., when a paper was read by Mr. Hall, entitled "Enlarging, and how I Manage It." The reader showed that, with a little ingenuity, it was quite possible for the amateur to produce very good work without recourse to the expensive apparatus now considered almost necessary, and this was amply borne out by the specimens of his work. Two new members were enrolled at the close of the meeting.

## To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance, the number and full title of the query referred to.

## QUERIES.

4527. **Hire of Studio.**—Shall be glad to know if there are studios to be hired by the day, or part of a day by amateurs. In the West-end preferable. I should want some scenery, but no assistance, and don't want to pay a large price.—**THISTLE.**

4528. **Development, Hand-Camera Negatives.**—Will some reader kindly give best formulae and mode of developing the above snap-shots?—**J. W.**

4529. **Developer Ready-made.**—Can any of your readers tell me of a good ready-made developer for Ilford dry ordinary plates and Ilford rapid, and where to get it and the price?—**STANLEY LEONARD WILTON.**

4530. **Black Tones.**—Can any one tell me how to get black tones on Ilford Alpha lantern plates?—**CLEVEDON.**

4531. **Optimus Hand-Camera.**—Should be glad if some kind friend would give me their opinion of the above, sold at £6 6s. Any information would be very acceptable.—**P. L. S.**

4532. **Celluloid Films.**—Where can I obtain films of about the same rapidity as ordinary slow plates? Does Thomas make these? Can they be relied upon for results equal to those on glass plates? Any information with regard to names and addresses of makers will oblige.—**CYCLO-PHOTOGRAPHER.**

4533. **Bicycle Carrier.**—Can any of your readers inform me what is the best method of carrying a half-plate kit on a safety bicycle so as to reduce the vibration to a minimum?—**W. G. O.**

4534. **Saturators.**—Would be glad of competent opinions as to the comparative merits, expense of burning, and safety, respectively of Scott's "warm air saturator," "the ether saturator," compared with compressed coal gas, for magic lantern.—**BUSY B.**

4535. **Reflex Camera.**—Can any one inform me about the Loman reflex camera, of which Messrs. Mawson and Swan are the London agents? Is it a very practical one? Is their high price with excellence of workmanship and lenses justified? Rapidity of the shutter? Are results good?—**GIULIO (Venice).**

4536. **Varnishing.**—Should a negative be varnished before retouching or afterwards?—**I. C. R.**

4537. **Borax Bath.**—What maker's paper is best suitable for the borax bath?—**I. C. R.**

4538. **Studio, Lighting of.**—A studio with roof thus A, lighted from the top on both sides only (no side light whatever). What sort of blinds should be used for the top lights, and does there require any at the sides?—**I. C. R.**

4539. **Cutting Mounts.**—Where can I obtain information on mount cutting? Can any one inform me how ovals are drawn for cutting out of mounts?—**SPIKE.**

4540. **Hand Camera.**—Can any brother amateur inform me where I can hire an automatic hand-camera for a few days?—**ROVER.**

4541. **Dark Tent.**—Can any one recommend me a small dark tent? Must be portable and inexpensive, no sink or fittings required.—**C. H. S.**

4542. **Ebonite Trays.**—Will any one kindly advise me name and address of largest manufactory of ebonite developing trays in England?—**CHARLES C. MACKLEY.**

## QUERIES UNANSWERED.

Feb. 13th.—Nos. 4500, 4503, 4505, 4509, 4510.  
" 20th.—Nos. 4512, 4514, 4517, 4519, 4520, 4521, 4522, 4523, 4524, 4525, 4526.

## ANSWERS.

4499. **Hand-Camera v. Camera and Tripod.**—Each is best for its particular work, but if you are going in for prize pictures don't expect to get your negatives by means of a hand-camera. By all means work one, but do not on that account give up your legged instrument. Would not advise a larger size than 5 by 4. The Kodaks, of course, are good, but, personally, I still prefer to use glass plates.—**THE SMITH.**

4501. **Kallitype.**—Am of opinion that the prints are more permanent than those on albumenised paper, the absence of hypos from the fixing bath being no inconsiderable item.—**THE SMITH.**

4504. **Exposure Note-Book.**—The only one I know of that is at all likely to give you the information is sold by Bridges, 15, South Charles Street, Baltimore.—**THE SMITH.**

4507. **Exposure.**—Give the portrait twelve seconds and the landscape three seconds, and you won't be very far out.—**THE SMITH.**

4508. **Flash Lamp.**—Quite possible. Write to Perken, Son, and Rayment, Hatton Garden.—**THE SMITH.**

4511. **Hydroquinone, Concentrated Formula Wanted.**—The following given in Wall's "Dictionary" may be of service to "Brown."

(1)			
Hydroquinone	...	...	£0 gr.
Metabisulphite of potash	...	...	100 "
Distilled water, to make	...	...	8 oz.
(2)			
Carbonate of soda	...	...	240 gr.
Carbonate of potash	...	...	240 "
Distilled water, to make	...	...	8 oz.

Developer:			
Solution No. 1	...	...	1 oz.
Solution No. 2	...	...	3 "
or,			
Hydroquinone	...	...	5 gr.
Sodium sulphite	...	...	10 "
Lime water	...	...	1 oz.

This, however, although a more portable form of developer, will only keep for a few weeks (three or four). Both give good results, but I would advise "Brown" to give the first a trial.—**WIZARD.**

4513. **Reblacking Diaphragms.**—Remove as much of the old blacking as possible with fine glass paper, warm the diaphragms till they can just be borne on the back of the hand, and immerse for ten seconds in a solution made by dissolving copper filings or wire in nitric acid diluted. Now heat them again over a clear flame and a fine dead black will be the result.—**WIZARD.**

4515. **Photographing on the Continent.**—No hindrances to photography in Belgium or Holland, except that the street children are more troublesome than in other countries. Police afford all facilities in Belgium. *Bruges* full of good subjects; to take tall tower of town hall ask leave to go to first-floor window of one of the cafés opposite, propriety is certain to be accommodating. For interiors of churches bribe sacristan; plenty of street loungers to carry apparatus. Innsbruck, and in Austria generally, no difficulties. Customs officials occasionally troublesome. Open everything you can safely; but they are beginning to know photographic apparatus now. Be careful at Trieste, which is close to frontier, so don't go near fortifications with camera. "Express" men in Austrian towns always ready to carry apparatus—payment by regular tariff. No difficulty in Austrian churches as a rule; it is the freest country in Europe next to England for the photographer. Beautiful country round Innsbruck. Riva, no hindrances; go to Arco from there, very picturesque. As to Switzerland, you can do anything you like in big towns; plates and chemicals procurable. I have not much experience of Italy. Customs officials inquisitive if they think apparatus is new; they are open to bribery. I have never heard of anybody being interfered with in photography, as is often the case in France especially, and sometimes near the frontier in Germany (e.g., Cologne). Strasburg is the only place in your list where I should refrain from freely using the camera, obviously dangerous, being frontier fortress. Ostend, Milan, Venice, and Zurich are on **AMATEUR PHOTOGRAPHER** list.—**C. S. COBB.**

4516. **Lens and Camera.**—Can strongly recommend you to get an Optimus R.R.; this is the finest all-round lens in the market. This with Underwood's Instanto camera makes a first-class set.—**W. A. JACKSON.**

4518. **Photographic Apparatus for India.**—See article in **AMATEUR PHOTOGRAPHER**, March 7th, 1890. Climate of Assam very damp, therefore necessary to have really well-made camera—all brass bound and well seasoned wood, say one of Watson's Premier pattern; his work can always be relied upon. Camera should have parallel bellows, double extension, all usual movements, but as simple and strong in construction as possible. In your case do not sacrifice anything to lightness, there is no necessity, portage is so cheap. Tripod, solid, three-fold, brass bound, rigid, and strong. Slides also brass bound, ordinary book pattern, six would be enough. I should not advise roll-holder, but take some film carriers, as films are very useful when travelling, though they doubtless do suffer from deterioration more than glass plates, particularly in damp climate.

Useless to say anything about exposure, must be learnt by experience. As to shutter, india-rubber, gutta-percha, etc., to be avoided. Take out such chemicals as you want to begin with; they can be procured in Calcutta, but at three times the cost, therefore I should advise a standing order with stores, a good dealer in England who could send you out what you required direct to Calcutta. Very difficult to keep sensitised papers in India, air-tight cases essential. As to plates, I found professionals almost always used Wratten and Wainwright's, so that you may conclude they are amongst the most satisfactory for tropical climates. As to developers, ammonia as an ingredient is to be avoided in hot weather; pyro and potash, or soda, or hydroquinone would be better. You should have all your goods packed for the voyage in tin-lined case, air tight, and keep them in it always when not actually in use. You will find natives skilful imitative carpenters capable of repairing damage to wood-work of camera, etc., but not in case of metal work. Take a good oil optical lantern, you will find it a great resource. Mawson's lantern plates, I hear, behave admirably in the similar climate of Singapore.—C. S. COBB

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING's post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED: AM: PHOT:

**NOTE.**—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.

**THISTLE.**—We know of no such accommodation to be had in London, but have inserted as a query.

**LEX.**—For the special purpose you require use the "Mawson" plate, develop with hydroquinone, their formula. Shall be very pleased to have a copy of the photograph named.

**ENGINEER.**—(1) Use the hot bath at a temperature of about 150 degs. (2) You will find the instrument very reliable. We will stir up the secretary of the society named. Glad to know that our three publications have been of the greatest benefit to you, and that they are, in fact, your teachers.

**F. T. CARTER.**—A servicable instrument.

**PUZZLED.**—We delayed answering your query till we had given the paper a fair trial, and we have kept freshly sensitised and commercial double and single albumenised and chloride emulsion paper wrapped up in the sample you sent, and can find no trace of any action. The reduction you noted, we think, must be ascribed to gaseous fumes of some kind.

**W. R.**—The exposure would be about half that required in England; it is advisable, however, to give as long as possible, otherwise the shadows are too dark and heavy. To obtain a head of 2½ in. you would have to get 5 ft. from sitter, for 3 in. head 4 ft., for 4½ in. head 3 ft. This is the largest head you can get with your lens, and even then you will get distortion. 3 in. is the largest you can use.

**A. H. WILLOUGHBY.**—We should advise you to get No. 2; we can recommend this instrument.

**LEO (Norwood).**—We prefer 9, and place in the following order—9, 1, 8, 6, 2, 7, 3, 4, 5, 10.

**W. MARSHALL.**—If you calculate everything out as grains you will not be far out.

**THE O'KELLY.**—Let it alone. You cannot remove the varnish. Copy the plate and use the resulting negative.

**T. G. WALMSLEY.**—The print would be eligible.

**SHILLELAGH.**—The liquid glue can be bought at an oil-man's, or possible, ironmonger's.

**C. S. COBB.**—We have letters too, and are convinced as to the position taken up being the right one. Many thanks for the answers.

**J. H. CHAMBERLAIN.**—(1) The photographs are exceedingly picturesque, but, owing to their having been taken in such strong sunlight, the shadows in many cases are too deep. (2) Buy either a large size "Eclipse" or No. 5 "Kodak," both splendid instruments. (3) Quite possible with either of the above. (4) Should be very glad of such an article.

**THOS. BARNES.**—Write to the secretary of the Liverpool Amateur Photographic Association, 3, Lord Street. We have not the gentleman's address.

**F. M.**—Your letter raises no point. Write to the makers.

**J. A. SINCLAIR.**—The slide was not broken by us, but owing to careless handling when exhibited.

**THE THAMP ABOARD.**—We do not reply because you send us no name or address.

**CYMO.**—A toy, and as such reliable.

**S. S. S.**—Write to the maker about the camera. The apparatus sold by the firm are admirable.

**NIPKEX.**—They are both good lenses. You must make your own selection; such a question has no place in our columns.

**MINSTER.**—In lenses, the following order—1, 3, 5, 4, 2; plates—4, 1, 6, 5, 3, 2.

**J. GOSAR.**—Certainly not up to competition work. You must study selection of subject, exposure, printing, and toning. Buy "Experimental Photography" (Leaper, 1s), and order the "A. P. Annual" (1s., see advertisement). The prints are useless.

**F. O. BARTON.**—The negative is over-exposed; about three seconds would have been correct. It is correctly developed, and your proportions seem to be about right, though we should use rather less of all the constituents of developer. We should advise you to get "Development," by Lyonel Clark, just published by our publishers, price 1s.

**CHAS. H. COX.**—We will write you by post.

**NIGER.**—The plate has been returned to you; we doubt very much whether the design on it is obtained by photography at all; it certainly is not collodion, and not gelatine. We fancy it is some sort of spirit varnish transfer. There should be no difficulty in making the carbon tissue adhere. You give us no hint what you want to do ultimately. Can you prepare the plate as in photogravure without damage to the final result? Try the special transparency tissue and use a safe edge of tinfoil ½ or ¾ in. wide, on the negative. Write us again, and we will give you further help if desired.

**H. WIDDOWS.**—The advantage of backing plates is to prevent halation, that is, to prevent the sky encroaching on branches and other prominent objects from becoming misty and indistinct. There is no advantage in using backed plates for portraiture. (1) Backing makes no difference to the exposure. (2) Get some black needle paper and smear it over with a mixture of equal parts of glycerine and water, and squeegee into contact with the back of the plate. (3) See above. (4) Yes, the slides are good. Always pleased to help you.

**C. F. S.**—Look again at your table of solubilities. Ours says '5, not 5. Caustic potash is soluble in half its weight of water.

**T. HALL.**—The exposure should be (1) about 1 second, (2) 3 seconds.

**J. ROBINSON.**—You cannot do better than get No. 2 lantern; for plates, we prefer B special. Hydroquinone is a good developer. Always pleased to help you.

**C. H. L.**—We never name apparatus in this column. If you send us a stamped directed envelope we will reply by post.

**GRONO.**—Put the negatives in a dish and cover them with methylated spirit, and allow them to remain about twenty minutes, and then take out singly and rub with a tuft of cotton wool and place in fresh spirit, and rub till quite clear of varnish, then dry. You had better get some old negatives and practice varnishing; it is by no means difficult, or we can give you a formula for varnish to be used cold.

**R. W. SHARLAND.**—All the sets will be criticised in "Holiday Work," which will appear in about a month. Sets will be returned soon. A. Point of view good, but over-exposed. B. Very poor in everything. C. Over-exposed. D. An inch off foreground would improve this. E. Fair, fully exposed. F. Under-exposed. G. Under-exposed an inch off foreground would not hurt this. I. Out an inch off this too. K. Bad. You are inclined to over-expose and undevelop, and are also printing in the sun, which does not conduce to good results. The stains are due to prints overlapping in some cases, in others to dirt of some kind. We do not know the authors address, but will find out, and send any communication you forward to him.

**LINDUM.**—Fabre's "Traité Encyclopédique" is published in twenty parts at 2s. per part. Rider's "Handbuch," in forty parts at 1s. each. We should prefer the latter. Our publishers can obtain them for you. The plates can be had from almost any large dealer in London. The instrument will give good but small results. The print enclosed is better than your last, but the lines in the background spoil it. Always avoid these if you can.

**ICONOCLAST II.**—(1) We do not think you could make a picture from this negative. (2) It might be improved in bromide with ¾ inch off foreground. (3) Insufficient washing before toning is most probably the cause.

**WHEELER AND CO.**—Have advised purchase.

**W. GOODWIN.**—Letter duly noted.

**J. M. DICKENS.**—The corrections will be made as suggested.

**R. FROST.**—Will refer to the matter next week. We rather think that the insurers have been effected in the same office.

**W. J. CLEAR.**—For the veriest beginner, buy "Amateur Photography" (T. C. Hepworth, 1s.), our publishers will send it by post on receipt of We are sending you specimen copy of this journal.

**W. H. WHITTARD.**—We should advise No. 2. We shall require the photographs. One of the conditions are that the prize photographs become our property. About a fortnight or three weeks.

**COM. E. A. PRICE, R.N.**—Will write you upon the subject of your letter.

**MISS BROUGHTON.**—Duly received the Facile camera and your advertisement, which will be inserted.

**MARTIN J. HARDING.**—Letter noted.

**CHARLES C. MACKLEY.**—We cannot help you, but insert as a query.

**G. BRITAIN.**—Our publishers will send on binding cases. Two slides only have to be entered for competition. Those you are using are excellent. No. try any good brand of gelatino-chloride paper and squeegee on to ground-glass. It is better mountant than starch.

## Quarterly Examinations in Photography.

### QUESTIONS.

19. Describe the production of a transparency by the carbon process.
20. What is the action of light upon a film of gelatine impregnated with bichromate of potash? And what is the action of the exposed film towards water and fatty ink?
21. Is there any difference between photographing a landscape and a reproduction of the same in oil colours? Explain your answer.

(Latest Day for Answers—March 9th.)

### RULES.

1. Answers must be received on the morning of the Monday week following the publication of the question.
2. All answers must be preceded by the question, and should be written on one side of the paper only.
3. A *nom de plume* may be used, but in every case the full name and address must also be given.
4. Answers must not exceed 250 words, unless otherwise stated by the examiners.
5. Those desirous of competing must apply to have their names entered, as these examinations are intended to encourage the study of the theory and practice of photography. Authorities upon photographic matters and contributors to the photographic journals will not be allowed to compete.

Marks will be given for all answers, and when possible, the three best answers will be published. Three prizes will be awarded at the end of each quarter.

All communications to be addressed:—

"EXAMINATION DEPARTMENT,"  
AMATEUR PHOTOGRAPHER,  
1, CREED LANE,  
LONDON, E.C.

## Sale and Exchange.

**RULES.**—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

### DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

Advertisements can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 3d. to cover postage.

"Amateur Photographer," bound, complete from beginning; what offers cash? — Rector, Elm, Frome.

AMATEUR PHOTOGRAPHER, vols. viii. to xii.; price 10s., or exchange. — Smith, 23, Manor Park Road, East Finchley, Middlesex.

AMATEUR PHOTOGRAPHER, from No. 1 to present date, less nine odd numbers; 15s.—Steel, 65, Springdale Road, Stoke Newington, N.

Bicycle.—Safety bicycle, ball bearings to all parts, including pedals, well plated and enamelled, in perfect order everywhere, adjustable to any size rider, easy running and pretty pattern, with lamp and all accessories; cost £11; price £7; bargain.—H. Baker, 2, Acre Lane, Brixton, S.W.

Cameras, etc.—Instantograph, half-plate, new pattern, complete, four double slides (wood), view-finder, also Gem pneumatic shutter, in thorough order, with canvas case; price 84s.; on approval; deposit system.—Bate, Milton, Gillingham.

Lancaster's quarter-plate 1890 Instantograph, every possible movement, as good as new, with tri-

We have the pleasure to give the following as the awards for the AMATEUR PHOTOGRAPHER Monthly Competition No. 22, "Snow and Hoar Frost."

*First Prize (Silver Medal).*

THOMAS MANSELL, L.D.S. . . . Birkenhead,

for a very beautiful study of "A Bright Winter's Morning, Bidston." This picture will be reproduced in the *Photographic Reporter* as a frontispiece. It was taken with an Aptus R.R. lens,  $f/22$ , and Mawson backed plate,  $1\frac{1}{2}$  seconds exposure in bright sunlight on December 21st, between twelve and one o'clock.

*Second Prize (Bronze Medal).*

HENRY IRVING . . . . . Darwen.

This competitor sends a photograph taken at the "Foot of Aber Fall, North Wales," in February last. The picture has more the appearance of an Alpine view, and is a splendid specimen of snow scenery. A Lancaster's Rectigraph lens was used,  $f/18$ , two seconds exposure being given to an Ilford ordinary plate, in shade, with clear sky. The print is on Obernetter paper.

Other contributions deserving of special note are "All on a Frosty Morning," contributed by the Rev. W. L. Groves,

taken on an Ilford rapid white label plate with a Ross R.S. lens working at  $f/22$ , with 12 seconds exposure. The photograph is a good study of hoar frost. Mrs. E. A. Cleasby can only enter in competition for the Silver Medal, she having been awarded our Bronze Medal; the photograph she contributes is very original, and is entitled "A Study in Black and White," rooks in the snow. Mrs. Cleasby says: "The rooks were about 18 ft. from the camera, which was concealed as much as possible inside a room with window open." The birds are capital, of course, in silhouette. A Swift's Paragon long-focus lens, 22 inch focus, was used, and an instantaneous exposure of an Edwards Isochromatic plate, given with a Furnell's shutter on January 19th, at 3.45 p.m., in bright diffused light. Another photograph, "A Christmas Visitor," by Mr. E. B. Wain, is a very fair picture; and a "Winter Scene," by Mr. W. Heath, is well chosen. "In Bolney Woods," by the Rev. R. C. Macleod, is a good study of hoar frost.

IN another column we refer to the meeting held on Monday evening, at the call of Mr. L. M. Biden, in the rooms of the parent society, with reference to the federation of the London Photographic Societies. There were representatives from a very considerable number of the societies, and a very successful meeting was held. Those present were unanimous with regard to the need of federation, and we congratulate Mr. Biden upon having at the outset received such hearty and encouraging support. It is not for us to point out the work to be done, but those who are interested to know our views might with advantage glance through the propositions we laid before the Camera Club Conference last year, especially with reference to exhibitions, a work which the federation might, we should think, take up. The continued growth of photographic societies needs such an organisation as Mr. Biden has sketched out. To maintain the members' interest in their society, the aid of competent lecturers and demonstrators is much needed, and we feel sure that if the federation could only arrange to secure the services of competent men who would for a reasonable fee lecture or demonstrate before photographic societies, much benefit would accrue to the members, photography would be advanced, and the apathy which now too often exists would in a great measure be removed. It will be interesting to know what support the larger societies will give to the movement. One thing is certain that if anything is to be done in regard to securing a reduction in railway fares for photographers it is imperative that a central society be formed. The President of the West London Photographic

Society, Mr. W. A. Brown, spoke hopefully of the support given by the societies in signing the memorial which will shortly be submitted to the Directors of the London and suburban railway companies. Another meeting will be called at an early date, and there is every likelihood of the federation getting to work before the season commences.

WE are very pleased to notice that the Council of the Photographic Society of Great Britain now admit those interested in photography to their technical meetings upon presentation of visiting card, a concession which many of our subscribers will much appreciate. The society's rooms are now at 50, Great Russell Street, W.C., and the Secretary, Mr. H. A. Lawrance, will, we are sure, willingly give particulars of forthcoming meetings.

THOSE interested in the decimal system will be pleased to know that the Education Department of the School Board has issued the following instructions:—

"The scholars in Standards 5, 6, and 7 should know the principles of the metric system, and be able to explain the advantages to be gained from uniformity in the method of forming multiples and sub-multiples of the unit. As a preparation for this, it will be useful to give in Standard 4 elementary lessons on the notation of decimal fractions."

THE tenth annual Sportsman's Exhibition in connection with the thirty-fifth show of the Kennel Club will be opened at the Agricultural Hall on April the 6th, and will continue open until the 11th.

It has been represented to us that the county of Wiltshire is exceptionally rich in subjects for camera men, and that at the present time there is no photographic society in the county. Perhaps some of our readers would send us their views as to the desirability of forming a society. Trowbridge has been suggested as a good centre, but we should be glad of any suggestions.

MR. J. S. B. JACKSON and Mr. J. T. Birkbeck, both of Lincoln, have sent us photographs of the lifting of a house in Lincoln. The building was raised three inches on the first day, on the next eight inches, then sixteen, and so on. The weight of the house is calculated at 200 tons, and the furniture remains *in situ*. No less than seventy-three powerful screw-jacks were used. Mr. Birkbeck's photographs are quite a curiosity, and show the arrangement of jacks, etc., admirably. A set of lantern slides and a brief description would cause some surprise and prove very interesting.

A CORRESPONDENT writes:—

"It seems a great pity that some of our bright, inventive minds have not contrived for us a hand-camera with a *swing front*, to answer the purpose of a swing-back in ordinary work. At present, especially where one carries a light walking-stick tripod, one is restricted to objects on a dead level with the lens, for if the objective be raised upward, all the perpendiculars converge, and no one wishes to see a church tower masquerading as a sugar loaf. If the front swung on a gimbal—the centre of which aligned with the sensitive film—the fixed focus would be preserved, and one could take a house, church, or, indeed, any object, no matter how high or low—a consummation devoutly to be wished."

MR. W. TANSLEY, of 14, Wentworth Street, Liverpool, advises us that "The Liverpool Camera Club will hold its ordinary meetings in the rooms of the Liverpool College, Shaw Street, on the second Wednesday evening in each month at eight o'clock." We know nothing of this club; the foregoing is the first communication we have received.

Mr. Tansley will no doubt be pleased to give further particulars,

AN assistant master of a first-class school writes us:—

"I am contemplating making a tour in Normandy for about three weeks from the middle of April, staying two or three days at the more important towns, as Lisieux, Rouen, etc., and should be glad to find a gentleman who would care to join me. Could you assist me by putting me in communication with any photographer who proposes making the same tour? The expense should not be very great. I have found one could do very comfortably in Brittany on about 7 f. a day."

We shall be pleased to place any subscribers who may be desirous of visiting Normandy in communication with our correspondent, who, we may add, is an M.A. of Oxford.

WE are asked to state that the Fourth Annual Exhibition of the joint American photographic societies will be held, under the auspices of the Society of Amateur Photographers of New York, from May 25th to June 6th. The exhibition is open to all photographers, American and foreign. No charge for wall space is made to foreign exhibitors; their exhibits must be sent by mail, *unmounted*, and must reach New York on or before May 1st, addressed to the "Committee of Arrangements," 113, West 38th Street, New York, U.S.A.

THE special competition, "The Seven Ages of Man," has proved a failure, and has also proved to us that such competitions are outside the scope of ordinary photography. We have only received two competitions, and shall award both a Bronze Medal. The first to come to hand was received from—

A. C. EVANS .. .. Alijarh, India, N.W.P., and is of a most novel character. We will not enter upon a description of the pictures this week, as in our next issue we shall reproduce Mr. Evans' photographs. The other competitor's work—

MR. F. S. JAMES .. .. Bideford, will also be described. There are several of them very meritorious, but they lack the originality and freshness of the pictures contributed by Mr. Evans.

THE Wesley Centenary prompts us to call attention to the fact that Messrs. York and Son, of 87, Lancaster Road, have an admirable set of slides for the optical lantern, "Scenes from the Life of John Wesley," with a lecture, illustrated by sixty slides, which at the present time would be of interest to many.

IN our correspondence columns we publish a letter setting out the desirability of forming a photographic society at Liberton, a suburb of Edinburgh. Our correspondent speaks strongly upon the benefit of such a society. Perhaps those of our readers who are of the same opinion will communicate with him.

THE Council of the Croydon Camera Club announce an Exhibition of Photographs and Apparatus to be held at the Braithwaite Hall, Croydon, on the 31st of March and the 1st and 2nd of April. Several prizes are offered. The photographs will, we believe, be restricted to members' work. The club has shown great energy, and not a week passes but new members are elected.

LAST week a lantern exhibition was given at Dundee under the auspices of the Dundee and East of Scotland Photographic Association, the lecturer being the Rev. D.

M. Ross, who is well known in Scotland, not only as an able lecturer, but as a most enthusiastic worker in photography.

THE "private views" at both the exhibitions of the Royal Scottish Society of Painters in Water Colours and the Royal Society of Painter-Etchers attracted gatherings of a "fine confused" nature, like Sydney Smith's definition of sheep's head. At the former exhibition, Art was represented by Mr. David Murray, A.R.A., who was congratulated on his exhibits; Mr. Frank Dicksee, A.R.A.; Sir Arthur Clay, whose picture "The Court of Criminal Appeal" has received so many compliments; Mr. W. Lockhart, R.S.A., whose Jubilee picture has just been published; and many other artists. Medicine had its masters in the person of Sir Wm. Jenner and Sir Spencer Wells. The Law sent representatives in Mr. Justice Lindley and Sir J. Simon; and among others whom we noticed were Lady Greville, Lady Crichton-Browne, the Hon. Mrs. Lowther, and Lady FitzWygram.

Some of the above were also present at the Royal Society of Painter-Etchers, where the absence of the President, Mr. F. Seymour Haden, was a subject of regret. Mr. E. A. Waterlow, A.R.A., rubbed shoulders with Mr. Leonard Courtney, M.P., who is generally seen at "private views," when Parliamentary duties permit. Here also we saw Sir Peter Lumsden enjoying the arts of peace in lieu of the arts of war, Viscount and Lady Lymington, Lady Loder, Lady Smyth, Lady Lawes, Mr. Chas. Eastlake, and others. Everybody seemed satisfied with the excellent specimens on view.

THE Chemical Society held its jubilee meeting and soirée on Tuesday, 24th ult., the meeting being held in the Theatre of the London University, the soirée at Goldsmiths' Hall. At the meeting, Mr. Warrington, the son of the first Secretary of the Society, presented an album containing the original letters and seventy-four portraits in platinotype of the founders of the Society. Sir William Grove, who is a veteran amongst the Fellows, had not caught the note on the permanency of the portraits, and he said that photographs could be perfectly and permanently preserved by soaking them in mastic varnish, which gets into the photograph and protects the silver. At the soirée Sir John Herschel's first attempts at photography were shown by Prof. A. S. Herschel, and the following is the description in Sir John Herschel's MS. journal of chemical experiments: "Having precipitated muriate of silver in a very delicately divided state from water very slightly muriated, it was allowed to settle on a glass plate; after forty-eight hours it had formed a film thin enough to bear drawing off the water very slowly by a syphon and drying. Having dried it, I found that it was very little affected by light, but by washing with weak nitrate of silver and drying it, it became highly sensible. In this state I took a camera picture of the telescope on it. Hyposulphite of soda then poured cautiously down washes away the muriate of silver, and leaves a beautiful delicate film of silver representing the picture. If then the other side of the glass be smoked and black varnished, the effect is much resembling daguerreotype, being dark on white as in nature, and also right and left as in nature, as if on polished silver." Besides this interesting exhibit, Warren de la Rue's first attempts at lunar photography were shown, and also a collection of photographs showing the action of the fluorescent rays of solution of quinine, which when used as an ink is quite invisible visually, but is reproduced by the sensitive salts of silver as black.

WE note that the members of the Holborn Camera Club are going to hold an exhibition and give a Cinderella dance at Auderton's Hotel, Fleet Street, on Saturday next.

THE annual dinner held by the members of the Croydon Camera Club is to be held at the "Greyhound" on the 9th inst.

### PHOTOGRAPHY IN COLOURS.

WE are enabled to give our readers further details of M. Lippmann's method of working, and also a diagram showing the disposition of the apparatus, and the explanation of the action of the mirror, etc., which are taken from an excellent article by M. Ch. Gravier, in the *Bulletin du Photo-Club de Paris*, a new magazine of great promise and of excellent appearance and get-up. The source of the light can, of course, be the sun in summer, but M. Lippmann used a Cance electric lamp of 800 candle-power A (fig. 1), the light of which is condensed by the lens B, and passes through the aperture of a screen C, then through the converging lens D, which renders the rays parallel, and through the prism E, where it is split up into its constituent rays, which pass on to the cell G, which contains a solution which cuts off all rays but those which are for the moment desired to affect the sensitive plate. The rays then pass through the objective H, and traverse the camera I, and strike on the sensitive surface contained in the cell K filled with mercury. The cell K is shown in fig. 2, in section and front view, and consists of a wooden box *b*, the front face of which is cut out and replaced by a sheet of glass G (fig. 2) on the interior surface of which is the sensitive film; the back of the cell is also a sheet of glass *d*, but may be of any other material. The two sheets of glass are held in close contact with the box *b* by four clips *pppp*, which prevent the escape of any of the mercury used. To photograph a window or any other coloured object the screen and prism are removed.

The sensitive film used by M. Lippmann is the collodio-albumen process according to Tuapenot's method; the developer is carbonate of ammonia with a little pyrogallie; and the fixing bath a 15 per cent. solution of hypo. The exposure required for the various spectrum colours varies, as one would naturally suppose, that for the blue being from twenty to thirty seconds, five or ten minutes for the green, and one hour for the red. The cell G (fig. 1), which acts as a light filter, is filled with certain solutions which are chosen according to the ray which it is desired to allow to act, and the solutions are tested spectroscopically in this respect; thus a solution of helianthin is used to cut off all but the red and yellow rays, a concentrated solution of bichromate of potash to allow the green rays to act, and the same solution diluted to allow the blue rays to act and cut off the violet.

As we have already seen, M. Lippmann depends upon the principle of interference, and the following is the explanation of fig. 3, and this phenomenon in this particular instance: Let us indicate the direction of a horizontal ray of light which will act on the sensitive film by the broken line, and the undulatory movement is indicated by the continued curved line, indicating a series of luminous waves of the length, *l* for the violet ray (*rayon violet*), and *L* for the red ray (*rayon rouge*).\* By looking at the diagram we shall see that a luminous ray after having passed through the sensitive film is arrested and reflected by the mercury, as a sound wave is arrested by the bottom of a pipe; let us in-

\* We must presume that our readers are sufficiently acquainted with elementary optics to require no explanation of these terms.—  
ED. AM: PHOT;

dicates the return of the reflected ray by the dotted curved line, and we shall see that it will cross the path of the first ray at certain points, and that the length of the wave will be reduced by half; we have here then interference, and at the points at which the curves cross each other, which are termed in acoustics nodal points, the effect should be darkness or nothing. The work resulting in interference should then be done by the troughs of the curves. If one represents the photographic work by a series of planes vertical to the centres of the curvature of the waves, it is easy to see that for a given distance the number of these planes should be a great many more for the violet than the red ray. The wave lengths for each coloured ray are given in optical or physical treatises; the number of these planes should be then in inverse ratio to the wave lengths.

It has been proved that the iridescent colours of mother-of-pearl and of soap bubbles are due to the superposition of minute films, which produce the phenomena of interference. M. Lippmann inferred that if it was possible to obtain in

a silver plate, or by a highly-polished metal plate, one might be able to colour a transparent and sensitive film, and which could be stripped after the impression of light, and one might be able to utilise this process practically. If by isochromatic sensitisers one could be able to obtain coloured impressions with relative values equal to those of the human retina, one may be able to obtain portraits by energetic developers.

The above is the gist of the article by M. Ch. Gravier, and it is sufficiently complete to require but very little addition; but it will perhaps be as well to point out that the enormous increase of exposure for red compared with that for blue, although a great objection, may not be an insuperable obstacle, as by the method hinted at in the concluding lines of M. Gravier's article, that is by the use of suitable orthochromatising substances, we may be able to so increase the sensitiveness to red and decrease the sensitiveness to blue as to render the relative exposures practically the same.

an homogeneous medium a superposition by photographic processes, there should be a colouration. Experience has proved the correctness of the perspicacity of this scientist; according to the coloured ray, he has obtained a superposition of films of silver which, just as proved by Foucault are transparent, and are separated by films of the vehicle (albumen, collodion, or gelatine) in which the salt of silver had been distributed. Mr. Lippmann has calculated that for a thickness of .20 of a millimetre the number of films of silver is 250 for the violet, 225 for the green, 200 for the yellow, and 166 for the red. The diagram (fig. 3) shows, considerably magnified, the disposition of the films, *o k* for the violet ray, and *O K* for the red ray.

To resume, we may say that a grand step has been made, from a scientific point of view, towards the obtaining of colours by photography. By replacing the mercury by

## Letters to the Editor.

### PHOTOGRAPHY IN COLOURS.

SIR,—Mr. G. Lacy's letter in your issue of last week, p. 148, calls, I think, for some reply, and although, like Mr. Lacy, I am no scientist, I must endeavour to give my views upon this question, and shall proceed with his letter seriatim, as I have made the subject of colour one of my studies.

We must all of us admit that "colour has no objective existence as colour," and also the truth of the whole of this paragraph, bar the last sentence, and I will ask Mr. Lacy one question, why does a bull hate bright red?

The learned professor, M. Lippmann and his apologists, do not claim that any inorganic substance receives "identical impressions to those of some given human eye," what they claim, as I understand it, is that some "philosophical inorganic substance" can so reflect certain of the constituent rays of heterogeneous white

light as to cause the impact of the remaining rays on our retina to give rise to what we call colour. "The parallelism between lengths of colour rays and thicknesses in layers of silver salt" is this, I take it. Supposing we take a vessel of pure water; the light transmitted through this, and reflected from its surface will be white, but if we add a spoonful or two of milk to it, what is the result? Why, the reflected light is no longer white, but white tinged with blue, the transmitted ray is yellow. Now let us add more milk, and the reflected light becomes bluer still, the transmitted light a deeper-toned yellow; and if we add more milk still, the transmitted ray becomes orange, then orange-red, then red, and finally disappears altogether. This, I take it, is what M. Lippmann has endeavoured to do; he has endeavoured to so precipitate his chemical and philosophical organic substance in varying and increasing layers that the particles of silver shall be able to so affect white light as to be able to extinguish or "interfere" with certain rays, that the remaining rays may give rise to the sensorial impressions we call colour. Mr. Lacy might learn something from a study, both theoretical and practical, of the phenomena of interference, and he would learn that there is a parallelism between the thickness of the interference-causing substance and the colours it gives; but an explanation of this is almost beyond my powers, and certainly beyond the limits of a letter. I'm not a "scientific bigwig," and I don't want to smash Mr. Lacy, but there are always two sides to a question. Perhaps he'll kindly smash me now.—Yours truly,

FARBENLEHRE.

\* \* \* \*

## CELEROTYPE.

SIR,—I beg to call attention to an error in one of your paragraphs under the heading of "Our Views." You state that Mr. Schölzig's "new gelatino-chloride emulsion paper differs from others in the market, as it is supplied in a white tint." Now, I have to claim for the Blackfriars Photographic and Sensitising Company, that we are the first and only firm who have ever, commercially, manufactured a successful gelatino-chloride emulsion paper in England, and, moreover, that I produced and placed on the market a white paper before Dr. Jacoby's was advertised in this country.—Yours truly,

WM. GOURLIE BLACKIE

(Manager to the Blackfriars Photographic and Sensitising Company).

\* \* \* \*

## MAGNESIUM CHLORIDE AS A FIXING AGENT.

SIR,—I have received a letter from Herr R. E. Liesegang on the above subject, a translation of which I append:—

"With reference to your article, *AMATEUR PHOTOGRAPHER*, p. 161, on fixing with magnesium chloride, I must make the following remarks to you. I made the first statement in *Photographisches Archiv*, 1890, p. 76. I there wrote: When I placed a few drops of a dilute solution of chloride of magnesium on gelatino-chloride of silver and allowed it to soak in, I noticed on exposure that the places coated with this remained white . . . The way in which magnesium chloride acts is, moreover, entirely different to that of the chlorides of sodium, potassium, and ammonium. The latter only fix, indeed, in that the chloride of silver dissolves in excess of the alkaline chloride, that thus the undecomposed chloride of silver goes out of the paper into the liquid. With my experiments with magnesium chloride could this naturally not be the case, since I allowed the same to soak into the film. The process has been generally falsely taken up, and therefore the statement in translation into other journals misrepresented Miethe himself, who gave a particular formula, used the salt as a fixing agent. He remarks on this property it is no better and no worse than other soluble chlorides, and has also no advantage over these.

"Later I remarked on this misunderstanding (*Photo. Archiv*, 90, p. 150): 'I explicitly pointed out that the chloride of silver is not removed in this process by washing.'

"I arrived at a new method of fixing by this means. The silver salt should no longer be removed from the picture, but merely made insensitive. One can attain this by certain chlorides. Thus Rose already found (Emelius, 'Handb. Chem.,' vol. iii, p. 615) that chloride of silver which had been precipitated with mercuric chloride, or only contained a trace of this salt, did not become coloured by light. The chlorides of the alkalis and alkaline earths are not sufficient, however, and I recalled the earlier statement as untrue. I found that 'the places coated with this (magnesium

chloride solution) were not thoroughly fixed, but became coloured somewhat blueish after a long time in light.' (*Photo. Archiv*, 1890, p. 151). On the other hand, prints which had been toned and fixed in a mixture of bromide of potassium, bromide of sodium, or bromide of cadmium and chloride of gold, and which have lain eight months in the light, remained quite unaltered. (The tone is warm brown and the gelatine is not hygroscopic). For fixing heliochromes (prints in natural colours), this method proved to be unsuitable as that by dissolving the silver salt. Whether it in the present form can take the place of hyposulphite of soda in ordinary is questionable; for if the permanency towards light is also perhaps the same, there is still the fact that the print contains silver salts against that formed of pure metal, a disadvantage against other chemical actions."

This letter clearly proves that Herr Liesegang has also recognized the facts as stated in my article, and this will be, I trust, sufficient to decently bury chloride of magnesium as a fixing agent.—Yours truly,

E. J. WALL.

\* \* \* \*

## COLOURED LANTERN-SLIDES.

SIR,—In a recent issue I notice that Mr. T. Perkins, M.A., in writing upon lantern-slides, says that there is a great prejudice among many people to visit lantern shows, giving as his reason that there are so many slides shown at exhibitions which are coloured. Also saying that in his eyes a coloured lantern-slide is an abomination, much resembling washes of water-colour over a wood-cut or line engraving.

Either your correspondent has never seen a properly coloured lantern-slide or does not understand what he is writing about. With regard to the colouring, I perfectly agree with Mr. Perkins that a great many so-called coloured lantern-slides are an abomination, but what can anyone expect for 1s. 6d. retail? Is it at all possible that a photograph of Christ Feeding the Five Thousand can be coloured and sold as a work of art for 1s. 6d.? Possibly Mr. Perkins has never seen a first-class lantern exhibition, such as that of Professor Malden, Messrs. W. R. May, Edward Ash, etc., etc., and if that is so I should strongly advise him to do so on the first possible opportunity.

In the meantime I forward to you three moderately-painted specimens of lantern slides, hoping that after you have seen them you will send them on to Mr. Perkins for his inspection; these are not my best quality, but a moderately cheap commercial article, which can be obtained at any respectable optician's.

My reason for troubling you is that such statements as Mr. Perkins makes are likely to prejudice and mislead would-be purchasers of coloured lantern-slides, thereby injuring opticians and the profession to which I belong.—Yours truly,

JOHN GREEN

(Ten years dissolving-view artist to the late Royal Polytechnic).

\* \* \* \*

## PHOTOGRAPHIC SOCIETY FOR LIBERTON, N.B.

SIR,—As a constant reader of your journal, I have been much impressed with the development of photography during the last few years, and the consequent formation of societies throughout the kingdom, and those who have been mainly instrumental in establishing them have to thank the *AMATEUR PHOTOGRAPHER* for services rendered in seconding their efforts, and in the present case I request your usual goodwill and advocacy. Liberton is a suburb of Edinburgh, surrounded by much fine scenery, and having in its neighbourhood many historic buildings, such as Craigmillar Castle, the well-known Dovecot Tower, the old parish church, Duddingston Church and Loch, with its fleet of graceful swans, the Braid Burn and Hermitage Glen, the Powburn, etc. It is no wonder it has been the hunting-ground of the camera men, and the place which owns many devoted workers. The nearest photographic society to us is the one which holds its meetings once a month in the centre of Edinburgh, and besides the distance for us to reach it, it is composed of a mixed class, professional and amateur, which, I think, is not quite the thing, as one feels small when among our big brethren, so we intend to have amateurs only in our society, and the rules to be drawn out will ensure that none but such will be eligible for membership. I ask the favour of the insertion of this communication in your journal, as I believe it will then be brought under the notice of other than those in the immediate locality, who might be willing to cast in their lot with us.—I am, etc.,

JOHN STUART.

Tower Villa, Liberton, N.B.

## Instantaneous Photography.

By W. JEROME HARRISON, F.G.S.

### CHAPTER XII.

#### HOW SENSITIVE PLATES AND FILMS FOR INSTANTANEOUS WORK ARE PREPARED.

WE have now described the three parts—the Support, the Sensitive Material, and the Adhesive—which together constitute the surface, or layer, upon which the image formed by the camera-lens is received, and by which it is retained. We must next briefly state how these three things are put together, that is, how dry-plates and films are made.

The objection may be raised, "Oh! nobody makes his own plates nowadays!" Well, to begin with, this statement is not quite correct. There are still good workers who prefer to be independent, and to be *certain* of the perfection and quality of their tools—for the dry-plate is the photographer's chief implement. Many, too, who know something of chemistry and physics find a keen pleasure in plate-making and in the study of the problems which it involves, believing, as the late Colonel Russell used to say, that "photography would be a most interesting subject *were it not for the pictures*!"

But there is another reason why every photographer should *understand* the manufacture of the sensitive gelatine dry-plates which he uses. Clever as our plate-makers are, and good as their plates usually are, it is impossible but that inferior or even bad plates should not unfrequently be placed upon the market. The ignorant worker will not be able to properly appreciate either the bad or the good points of a plate. Sometimes he will blame the plates for his own mistakes, and sometimes the case will be *vice versa*. It has long been recognised that every mistress of a household—be she a duchess—should know how to cook. For though she may seldom or never require to practise the art, yet she can discriminately give neither praise nor blame to her servants unless she is practically acquainted with their work. Now the plate-maker is the photographer's cook, and very careful cooking is required to produce a gelatine emulsion which shall satisfy the fastidious and educated taste of the "shadow-snatchers" of the present day.

Again, it is not likely that we have reached finality even in the preparation of photographic dry-plates. But those who wish to advance photography—and nearly all the great advances in this direction have had their origin in the brains of men working as amateurs at the subject because they loved it—will not be content until they have mastered every practical detail. For it is only by such mastery that the power to make still further advances is to be obtained.

*Object of Emulsion-making.*—The thing to be aimed at in emulsion-making is to obtain *pure* silver bromide in particles of the one eight-thousandth of an inch in diameter, embedded in a thin level coating of *pure* gelatine upon a glass plate or a film of celluloid. The particles of silver bromide must be present in such numbers that when the coated plate is held between the eye and the flame from an ordinary gas-burner (at a distance of about a foot from the latter) the outline or shape of the flame shall *not* be distinguishable.

*How Silver Bromide is Made.*—The compound of silver and bromine which forms the mainstay of modern photography is produced by mixing together solutions of silver nitrate and ammonium bromide. Immediately this is done the two chemicals "change partners," so to speak, and produce silver bromide and ammonium nitrate. The last-named substance is soluble in water, and is washed away. The silver bromide is then mixed with gelatine, and poured

upon the "support"—glass or celluloid—which is to sustain it within the camera.

*How Silver Bromide Particles of the Right Size are Obtained.*—It is not sufficient for our purpose merely to obtain "silver bromide;" we wish to secure that form or molecular modification of this substance which is most sensitive to light.

When the silver bromide is first formed each particle is *extremely* small—only the twenty-thousandth part of an inch or so in diameter. It then transmits ruby light. But these particles can be made to grow in size, and they then transmit blue light. When the particles of the silver salt are about the eight-thousandth part of an inch in diameter, they are then most sensitive to light.

There are two methods by which molecules of the right size are best obtained—

(1) *Sensitiveness Obtained by Boiling the Silver Bromide.*—The silver bromide is slightly soluble in the solution of ammonium bromide plus gelatine, which forms part of every gelatine emulsion. But, under the influence of heat, this dissolved silver bromide settles down upon the undissolved particles of the same salt, thus increasing their size. It is usually found that after boiling the emulsion for about forty minutes, the silver bromide particles have attained the right size—about the eight-thousandth of an inch in diameter—and this is tested by examining a drop of the emulsion under a microscope, and by observing if the colour of the light transmitted by the emulsion has changed from ruby to blue. This method of obtaining sensitiveness by heat is due, as we have already shown, to the labours of Bennett and Mansfield in 1878-9.

(2) *Increased Sensitiveness obtained by Adding Ammonia to the Silver Bromide.*—Ammonia possesses the power of dissolving silver bromide. When this alkali is added to the emulsion of silver bromide in gelatine it dissolves some of the silver salt. By gentle heat the ammonia can be driven off, and the dissolved silver bromide then settles upon the particles of silver bromide which have not been dissolved, and increases their size. This "ammonia method" was discovered by the Belgian chemist, Dr. D. Van Monckhoven, in 1879.

The gradual growth of the silver bromide particles (with the consequent increase in sensitiveness) obtained by either of the two methods now described, is known as the "ripening" of the emulsion. It is easy to carry matters too far, and to overdo this ripening; the silver bromide then suffers chemical decomposition, and the emulsion is spoiled.

(To be continued.)

**A Durable Hydroquinone Developer.**—Dr. O. Lohse, in a contribution to the "Photographisches Almanach," gives the results of his experiments upon the possibility of using resorcin in conjunction with hydroquinone, and he recommends the following as the most suitable formula:—

Hydroquinone	...	...	...	...	7.5 grammes.
Resorcin	...	...	...	...	0.4 "
Sodium sulphite	...	...	...	...	30.0 "
" carbonate	...	...	...	...	20.0 "
Distilled water	...	...	...	...	1,000 cc.m.

**Xyol.**—M. R. L. Delprier gives, in *Les Annales Photographiques*, the following formula for this new developer, which has given him satisfactory results:—After having dissolved the xyol in 60 c.c. of distilled water, prepare a solution of caustic soda at 2½ per cent. First plunge the negative in the xyol from two to four minutes, according to the rapidity of the exposure, then take it out and place it in the soda solution, agitating the dish. The print immediately shows itself, and even a weak negative is quickly strengthened, when treated by this process. Xyol not being liable to change, may be used until the liquid is exhausted; the soda should be rejected after two or three plates have been developed.

## Studies in Art for Photographers.

By REV. F. C. LAMBERT, M.A.

### CHAPTER IV.

#### BREADTH, UNITY, SIMPLICITY.

AMONG the many and various terms used by artists, the word *breadth* occurs very frequently. The expression is used to convey the idea of grouping together patches of light, half light, and dark, in such a way as to avoid anything like spottiness.

The following experiment is worth making. Cut up a dozen or more bits of paper of each of the following tints: light grey, dark grey, black. Let each bit be of somewhat different (irregular) shape to the rest, say, roughly speaking, about the size of a postage stamp, or somewhat larger. Now, with your three or four dozen paper scraps and a large sheet of white paper, try and build up in a rough form any object you may have before you as a copy, *e.g.*, a tree, a head, a house, using your pieces "edge to edge." As a matter of course, there will be places where you get a *bad fit*, *i.e.*, where the white paper shows through the small spaces, wherever the pieces do not quite fit. Look at your rough patch sketch (mosaic) from a distance, and with eyes a little closed, so as to soften somewhat the outlines. Observe the *patchy* effect of the white ground cropping up, and that it is more offensive in the darker than in the lighter parts.

Now add to your stock of paper scraps a similar lot cut from white paper. Repeat your experiment, this time using a ground work of a tint somewhere between your light and dark grey tints. You will at once observe that the patchy effect is not so offensive as when using a white ground.

Now, readjust your paper scraps by moving them up towards each other, so that they just overlap without letting any of the ground (background tint) show through, except in large and continuous patches. Repeat the experiment with the white paper ground.

You will doubtless have observed that *small* spottiness, patchiness, or streakiness is highly offensive, and gives the notion of disconnection of the various parts; while the opposite quality, breadth, simplicity, massing of similar tints, conveys the feeling of largeness, harmony, continuity.

Turn to nature for a moment and compare the effect of a leaf-clad tree against the sky, with a similar tree against a hill side. Observe, again, the varying effect of the direction of light in both instances.

It can scarcely be said that we *always* have breadth in nature; but it may safely be affirmed that there is much more breadth in nature than we should be led to suppose had we only the so-called works of art whereupon to form our opinion. With equal safety may it be affirmed that this quality which we call breadth, if not essential in every work of fine art, is at least wrongly absent in a very large majority of cases.

Careful examination of a mountain range, in weather which has just a *suspicion* of slight fog or haze, shows the effect of the gradual softening of edges, and blending of small masses, as hill after hill recedes into a soft blue-grey band against the sky. Again, everyone knows how greatly the judgment of distances is influenced by the varying effect of atmosphere. Hence a due regard to the expression of breadth in proper proportion is of the greatest assistance in conveying the feeling of distance, and the indescribable consciousness of the open air which is found in all true and good landscape work.

It is often said that breadth is opposed to detail, and

*vice versa*. This is far from being the case, as one may very easily see by performing the very simple experiment of photographing an appropriate scene, say a hillside, bank of trees, group of buildings, etc., from various points of view, so as to get different lightings, but always using the same lens, stop, etc. We may thus have practically the same degree of detail under various schemes of lighting, *i.e.*, varying degrees of breadth.

It must, however, be observed that by the judicious use of lens and stop very various results may be obtained which in some respects are analogous to the mental effect produced by breadth.

The most desirable state of things requires a thoughtful selection of time of day, exposure, lens, stop, and also propitious atmospheric conditions; so that, without destroying detail to the degree of irritating fuzziness, there may be expressed all the detail which the mind requires—visible on concentrated examination, but never making its presence obtrusively felt in the slightest degree.

The great power of simplicity of arrangement of masses, and the feeling of the open air and expanse of nature, is frequently to be observed in the rolling masses of storm clouds. Glorious pictures may be seen in cloudland before or after a sudden storm. In such studies one may well see the power of breadth and also *unity*.

The word *unity*, like balance, is variously applied. For instance, to the theme (*i.e.*, the component elements, parts, figures), and in a very similar sense the terms *consistency* and *fitness* are also applied. The word *unity* is also at times used in place of *continuity* of the relative planes. So that the parts of the picture are not only consistent one with the other, but also that they join one to the other, so that, as one writer expresses it, "you can imagine yourself walking about the picture without the fear of stepping into some chasm or abyss."

Again, unity is sometimes used to express what another writer has appropriately called the *law of principality*; which is again called the *principle of subordination*. By these expressions it is meant that in the composition not only the component parts belong to each other, but also that there is some one part to which all the others are subordinate, and that among the subordinate parts there is some sort of relative order of importance or pictorial merit.

Thus it will be seen that these terms, *breadth* and *unity*, are incapable of being crisply defined, seeing that they overlap each other in meaning; for instance, breadth is necessary for the due expression of unity.

Again, both balance of line and also of light and shade are generally necessary for satisfactory expression of breadth and also of unity.

Once again, the great law of *simplicity* lies at the root of all three; seeing that the feeling of complexity, or of self-assertive design, is opposed to each of these three fundamental qualities.

Hence the greatest art is always strong in its simplicity.

**Articles on Photo-Micrography** (Answer to "Microscope")—Mr. Pringle writes: "Your questions will, so far as possible, be answered in a private letter; the replies would take up too much space in these columns."

**A Paste which will Stick Anything.**—Take 2 oz. of clear gum arabic, 1½ oz. of fine starch, and ½ oz. of white sugar. Dissolve the gum arabic in as much water as the laundress would use for the quantity of starch indicated. Mix the starch and sugar with the mucilage. Then cook the mixture in a vessel suspended in boiling water until the starch becomes clear. The cement should be as thick as tar, and kept so. It can be kept from spoiling by the addition of camphor or a little oil of cloves.

## Photographic References.

By MAJOR J. FORTUNÉ NOTT.

### DEVELOPMENT.

FOLLOWING the correct order of procedure towards the production of a negative, we have now arrived at the stage when the services of the camera are no longer necessary, and the last and crucial operation known as development is all that is requisite for the completion of this important step in the creation of a photograph.

It is hardly necessary to state that the work of developing has to be done in the dark-room, but it may be as well to mention the fact that until this place is reached the greatest care should be taken of the dark slides that contain the exposed plates, for any white light, even of the faintest kind, that may penetrate through the slides will work havoc with the brilliancy of the plates during the operation we are now about to describe. It is not wise to place too much dependence on the good qualities of the workmanship which the dark slides exhibit, for accidents will often happen even with the most careful workers, and the weather can affect the wood so as to render the backs anything but light-tight in the strictest sense; hence as a little precaution against contingencies of this nature occurring may save considerable disappointment and annoyance, it is well to give the matter some attention. A photographer of considerable experience who habitually produces negatives remarkable for their brightness and clearness, informed the writer that the only secret of insuring such results—all other things, of course, being correct—lay in the care displayed in protecting the plate-holders as much as possible from daylight during every operation in which they had to be handled. He had satisfied himself regarding this point by experimenting. His apparatus was as perfect as a first-class manufacturer could supply, and he had no fault to find with it, but still he noticed there was a marked difference in the "pluck" of negatives resulting from the two methods of procedure. One plate holder he kept well covered, and, moreover, wrapped the camera around with the focussing cloth during the exposures. With the other he took no such precautions, but trusted to the good workmanship of his appliances, with the result that it confirmed him in the opinion that the greatest care should be exercised, especially in bright light. The subtle character of that change which light creates in the nature of the sensitive emulsion can be exerted apparently through wood when it is as thin as that frequently employed for the shutters of camera backs. The effect does not quite amount to what is generally recognised as "fog," but there is a perceptible dulness or absence of that quality known among photographers as "sparkle;" in fact, there is a certain degradation, which is easily discerned by the skilled worker, and by many amateurs is, no doubt, often attributed to some defective quality in the plates themselves. As habits, good or bad, can be acquired from the very start, the tyro in photography should remember that small or apparently minor matters, such as the careful wrapping up of dark slides, and other little precautions to which we have endeavoured to draw attention, can exert a great influence on the character of the work he produces. The results of negligent methods of procedure only become evident during the operation known as development, consequently there does not exist any remedy for the evils produced by carelessness.

The exact nature of the change that is created by the light striking upon the sensitive emulsion with which the

plate is coated has never been ascertained. Several opinions have been expressed and conjectures hazarded, but it still remains a mystery for science to solve. With this phase of the question we have no concern at present. For the photographer's purpose it suffices to know that a change has taken place, and that, after the plate has been exposed in the manner before-described, by the employment of certain simple chemicals the image which has been impressed upon the plate, but is nevertheless latent, or not visible, can be brought out and fixed, in a manner that renders it unalterable by the further action of light. As this image is the reverse of the one which has ultimately to be produced in order to get a correct photograph, it is known as the negative, and the latter production as the positive. That is to say, in the negative, the parts which will print white are black, and the black parts or shadows are white. It is very necessary to bear this in mind, and to be able to quickly discern the gradations between the two extremes; for this information is required in the dark-room to prevent under or over development. As experience is gained, and if the utility of the knowledge is appreciated, the photographer can soon acquire the power of critically examining a negative, and of knowing just what character of print it will make. In fact, it will be impossible for him to produce a satisfactory negative, except by a fluke, unless he thoroughly understands the class of work which he should endeavour to create, and then what changes or method of procedure are necessary in order to fulfil his object.

Regarding the negative: no amount of written description can convey any practical information respecting its good or bad qualities which can be of any service to the beginner; he must in some way get a few object lessons by examining some specimens of the article themselves and the prints that result from their use. He will, if he has any critical faculties and is quick to discern distinctions, find that some negatives have the image represented in too thin or transparent a manner, a fault resulting from over-exposure or under-development; others are the reverse, too dense or hard, so that the light cannot act through them in printing, with the consequence that the photographs are all black and white, with no gradation or half-tone. This fault is the result of under-exposure or bad development in the sense that the ingredients employed in mixing the developer have not been correctly gauged to suit the needs of the subject or the exposure which has been given to it. Again, the colour of the negative will be found to materially affect its printing qualities. This colour generally results from the nature of the developer employed. It is often useful to know how to get any colour necessary, for different tints have such influence on the prints that it is sometimes convenient to avail oneself of the power which it confers. A very pretty looking negative, which in the eyes of the inexperienced may look like a sample of perfection, is not always a good negative; it is very easy to be deceived upon this point. The proof of the pudding is in the eating, and the proof of the negative is in the printing, although this statement must be qualified to this extent, that the printing process must be decided upon when the plate is being developed, for every process requires for any near approach to perfection, a special character of, negative. Upon this subject we hope to have some remarks to make at a later stage of this series of articles.

Before entering upon the description of the procedure to be adopted in developing plates or films, we consider it advisable to sound a note of warning cautioning the beginner against a certain class of photographer who will try to impress him with the idea that it is a purely mechanical process, calling for no particular skill beyond that required in mixing certain chemicals and in regulating the quanti-

ties that have to be applied to the plates. In every stage of photographic work, skill, knowledge, care, and patience are absolutely essential—in the developing-room, perhaps more than anywhere else, for here the photographer can exert more control over his work than is possible at any other of the various operations required for the production of a photograph.

(To be continued.)

## Federation of London and Suburban Societies.

THE meeting held at the rooms of the Photographic Society of Great Britain on Monday night to consider the desirability of forming an association or federation of the London and suburban photographic societies was fairly well attended, but, as was naturally to be expected, several of the gentlemen present, though sent as representatives by their societies, were sent to hear rather than to speak. The consequence was that there was not very much talking, but good business was done. The chair was occupied by Mr. Lewis M. Biden, President of the Toynbee Camera Club, who is the originator of the project, and who has displayed much energy in the matter up to the present point. The Chairman briefly sketched his idea of the objects of such an association as he had in his mind, the main object, of course, being mutual help and support. It often happened that in the smaller societies most of the members were beginners, and the more advanced members could not give up every evening to assist and teach them, and frequently the secretary had considerable difficulty in drawing up the syllabus for the season, and there were numbers of meetings at which no business was done. On the other hand, some of the advanced members would be perfectly willing to spend hours on the preparation of a paper and experiments if they knew that its benefit would not be confined to one society. One of the objects of the Federation would then be to secure the names of such readers as were willing to re-read their papers before other societies. Then again the Federation could support the West London Society in its laudable endeavour to secure cheap railway fares for photographers on pleasure bent, and the Federation would have much more weight with the railway companies than one society could possibly have. Then there was the question of lantern slides. Many members made a number of slides which were shown once and then put aside and forgotten. This was a great pity. The Federation might take a note of those slides, and then when a series illustrating any special place was required it could be found, and so the time and trouble spent on the slides would not be wasted. Then there was the question of approaching the Photographic Society of Great Britain, with a view to its admitting the societies as corporate members of its body at a fee of, say, £1 ls. each society.

Mr. W. A. Brown, Chairman of the West London Photographic Society, said he should be disposed to join a federation if the larger societies would join; if they did not do so, it would be useless for the smaller societies to form a federation. The exchange of lectures and lantern slides would manifestly be a great help to the societies. The joining of the Photographic Society of Great Britain would also be a great advantage to the societies, as it would enable any member to attend the lectures and meetings of the parent society.

The Chairman said there would have to be some limit to the rights of members of societies as members of the parent society.

Mr. Brown pointed out that the West London Society was not the originator of the cheap railway fares, but had taken it up after it had been once dropped. Federation meant some expense, and the societies would want to know what they would be expected to pay.

The Chairman said he had given a little thought to that point, and he had the idea, perhaps five per cent. on the gross income of the Society, with perhaps a reduction to the larger societies. He had answers from good numbers of societies, and not one of them was unfavourable.

Mr. Deane said some years ago a society applied to the railway companies for cheap fares, and practically they were offered second-class tickets for third-class fares.

Mr. Cherry, of the North Middlesex Society, asked whether federation meant affiliation or absorption in one great society?

The Chairman said it meant affiliation; each society would manage its own affairs in its own way. The Federation would have certain meetings at which delegates from the societies would meet and make their wants known and the General Secretary would take notice of them.

After some further conversation,

Mr. C. W. Hastings suggested that the sense of the meeting should be taken on the main question, and that then the societies would have something tangible to consider before the next meeting. A movement to secure a reduction in railway fares was mooted in the columns of the AMATEUR PHOTOGRAPHER in 1885, but had fallen through, probably because there was then no organisation and far fewer societies.

It was then unanimously resolved:

1. That it is desirable to form an association or federation of societies and clubs whose members are interested in photography.
2. That the London and suburban societies be requested each to send two delegates to make the necessary arrangements to settle the name and draw up the constitution of the proposed association, and to fix the terms of membership, etc., the delegates to have power to appoint a Committee for this purpose, such delegates to continue to act for a period not exceeding six months from the launching of the Association.
3. That the delegates take into consideration the following objects, first—
  - (a) The interchange of lectures, papers, lantern slides, etc.
  - (b) The obtaining the reduction of railway fares to photographers on their outings, either singly or in parties.
  - (c) The admission of the various societies joining the Federation as corporate members of the Photographic Society of Great Britain.
  - (d) Generally to promote photographic knowledge and research.
4. That the delegates be requested to prepare a list of honorary lecturers who, when disengaged, will, without charge or fee, lecture, read papers, give demonstrations and lantern evenings before other societies, and to make rules in connection with the expenses and otherwise.

In reply to Mr. Brown,

The Chairman said that at first the Federation would be of the London and suburban societies; the committee would decide if those limits should be extended.

Mr. Sturmev said he did not think they would get the provincial societies to join at first; besides, by confining it as proposed, they might get the whole of the London and suburban societies, and be a united body as far as they went.

Some discussion took place as to whether the Photographic Society of Great Britain would be likely to join the Association, but the general opinion seemed to be that for the present they must be content with the continuance of that body, which might join when it saw what the Federation was going to do.

The proceedings terminated with votes of thanks to the Photographic Society of Great Britain for the use of the room, and to Mr. Biden for presiding and for his action in the matter.

**More indiarubber** will be dissolved by adding 5 to 15 per cent. of oil of eucalyptus to the benzol or carbon bisulphide used; in the latter proportions, the mixture of carbon bisulphide will dissolve nearly 20 per cent. of indiarubber.—*Pharm. Centralblatt.*

**Photographic Apparatus for India.**—Mr. J. W. Boothman writes:—"I feel deeply indebted to your correspondent, Mr. C. S. Cobb, for his very exhaustive reply to my query, for which I beg to tender him my sincere thanks, and, if I am not trespassing on your space too much, I should here like to record my appreciation of the courtesy and the eagerness to be of assistance shown by many of our more widely-learned photographic confières, through the columns of the AMATEUR PHOTOGRAPHER. It speaks volumes, I think, for our fascinating art science, to find its students ever ready to impart the knowledge they possess to those less favoured than themselves, and I feel myself to be particularly fortunate in having elicited a reply from an artist whose descriptive articles of foreign scenes and experience have been of the greatest interest to many thousands besides."

## Our Contemporaries.

The *American Journal of Photography*, speaking on the question of "Focussing," says—"In conversing with a friend lately, upon the subject of throwing a portion of the view out of focus, he expressed an idea which is certainly very true, namely, that in looking at a scene in nature we have everywhere the details before us in all their perfection, but we only see them at the particular point which is claiming our attention for the moment, and the case is much the same in looking at a photograph. Let the detail be good all over, and the eyes will find satisfaction at whatever particular point they may look for it, without being disturbed by that which surrounds. We hope that it will be clearly understood that what we have written is solely in relation to landscape scenes."

The *Lithographic Art Journal* speaks of a new substance "hyaline," which is likely to be utilised in photography. It is "a 'horny, translucent, plastic composition of great tensile strength and considerable elasticity, which may be used as a cheap and inodorous substitute for celluloid, and can be worked, dyed, pressed, denitrated, and rendered incombustible or fireproof.' 'Hyaline' is a mixture of about equal parts of gun-cotton and colophony, or shellac, damar, turpentine, or of any mixture of these resins."

*Wilson's Photographic Magazine*, talking of "Progress," says—"But we must confront the fact that there are many men so enamoured of their own work as to believe that they cannot do better. The stupidity of such a belief is altogether inexcusable, but we will waive the discussion of that just now, and point out in what direction there is hope, even for them, in the matter of obtaining better prices for their work. Let them, each after his own fashion, get out a new style of photograph, individualised by some peculiarity of pose, lighting, or finish, and introduce it with their regular work at a higher rate. To our mind, the most sensible way of doing this is to adopt some special printing process for this high-grade work. The degree of admiration created in the public mind by photographs printed in other ways than by the too familiar albumen-paper process, is little understood and still less appreciated by many photographers. Put this hint into practice during 1891, and note the effect." It also quotes the following new photographic process:—"Commence by washing a very plane copper plate with acetic acid, then with water. When dry, coat it with the following solution:

Tannin .. .. .	4 grammes.
Gallic acid .. .. .	2 "
Water .. .. .	500 "

The plate drained and dried is then coated with—

Distilled water .. .. .	1,000 grammes.
Gelatine .. .. .	100 "
Alcohol .. .. .	50 "
Bichromate of potassium .. .. .	10 "
Bichromate of ammonium .. .. .	10 "
White of egg .. .. .	10 c.c.
Pure glycerine .. .. .	10 drops.

After exposure, the plate is treated by a concentrated solution of sulphate of iron. A relief is then obtained, which is moulded with the following amalgam:

Bismuth .. .. .	4 parts.
Lead .. .. .	32 "
Tin .. .. .	32 "
Antimony .. .. .	8 "
Copper .. .. .	4 "
Mercury .. .. .	1 part."

The *English Mechanic* gives the following "Test Paper for Acid"—"Cut white filtering paper of neutral reaction in pieces of about 6 in. square, and impregnate them with tincture of curcuma (1 part curcuma, 7 parts alcohol, and 1 part water). Place the paper on threads to dry. When dry pass a sheet of it through a bath composed of 40 drops of liquor of potassæ and 100 c.c. water. Then immediately pass it through a bath of water (flat earthen dishes are convenient for the baths), and at once place it on a thread to dry. As soon as it is dry cut it in pieces and inclose them in tinfoil. The paper will not bear long exposure to light and air, but will keep well if inclosed in tinfoil. It is much more sensitive than litmus-paper, and will detect acid in a mixture of 1 part of hydrochloric acid in 150,000 parts of distilled water, and will detect carbonic acid in spring water. If the water

be boiled to expel carbonic acid, and a yellow colour is produced, some free acid (besides CO<sub>2</sub>) is shown to be present. The best way to use the paper is to touch it with a glass rod which has been wetted with the liquid to be tested. The paper can be freshly prepared in fifteen or twenty minutes."

The *Beacon* says—"With the average amateur, all is fish that comes to his net, and too frequently, and mainly in consequence thereof, his basket generally contains nothing but small fry. To pop away at the first thing that comes is excusable in the try of but a few months, while the novelty of producing a picture of any kind is sufficient inducement to persevere, and reward enough for the outlay in wasted plates; but as soon as that stage has passed, then 'learn to see,' which requires more patience and practice than many are aware of. Now, as this power of 'seeing' comes by practice, and as there are many branches in out-door work widely differing from each other, it will be evident that he who sticks to one will be more likely to master it than he who roams about from branch to branch like a bee from flower to flower, but, unlike the bee, makes no honey. In the early days of wet collodion we had a friend who was ever present at the weekly outings, and whose work was admired by all and envied by some of his fellows. We did not think of it then, but know it now; he had a craze for old bridges and water sluices, and there was not one or the other within a radius of fifty miles that he had not laid under contribution. He stuck to that class of work, had thought out every line that best could be made to tell; he was a specialist in fact, and hence his great success. There is no need to suggest the various branches into which out-door work may be divided; each should find out his own particular class for himself, guided both by inclination and circumstances; but the more limited the better. The mere mention of lake and river scenery, little picturesque nooks and corners, architecture, domestic, ecclesiastical and rural, rural occupations, marine subjects, genre studies, 'cloudland' in its various aspects, cattle, horses and animals generally, both domestic and wild, although but a few of the many branches, will show how wide is the choice; and we earnestly recommend all who wish to excel or make their mark in photography, to select some one of them and stick to it, and in that way help to bring about such a condition of matters that everyone's individuality will be recognised in his work; so that in looking over a miscellaneous collection of photographs we will be able to say, this is a Brown, this a Jones, and this a Robinson."

The *Photographic Herald and Sportsman*, in an article by Leslie Selby on "Clark's Platinum Toning," says—"I then put in three five by four aristotype prints, and of these, the first toned to a good black, the second to a chocolate brown, and the third would not go much beyond a red. Apparently they exhausted the baths I then washed them all in a bath of ammonia and water, and, fixed them in the usual way. When dry, the matt-surface prints were not altogether a success, not so much on account of the tone, but they appeared to be much wanting in vigour, which I put down to the negatives being unsuitable, but the tone of the aristotypes was better than any I have been able to get with a gold toning bath. The matt-surface prints lost a little of the tone in the fixing bath, but the aristotypes, on the contrary, seemed to go on toning for a short time, and dried a still better tone. This however, I fancy I have noticed with them in the ordinary platinum toning process. Altogether, I was quite satisfied with my experiment."

**A New Gold Salt.**—Herr Lainer, of the Vienna Institute of Photography, has introduced the following process for obtaining a stable and constant salt of gold, which can easily be prepared chemically pure and free from acid, which does not deliquesce or effloresce, and gives toning baths of constant and reliable action. One hundred parts of gold are dissolved in aqua regia, and hydrochloric acid added to the solution. To the solution of pure chloride of gold thus prepared, one adds 38 parts of chloride of potassium. The mixture thus obtained is carefully evaporated till crystallisation, when the dish or vessel is placed under a bell jar containing concentrated sulphuric acid or quick lime. The mother liquor is poured off, and this again evaporated and treated as above. The crystals thus obtained are dried under a bell jar, and heated to 100 to 110° C. to drive off the remaining traces of free hydrochloric acid. The salt thus procured forms yellow hexagonal needles, easily soluble in water, and of which 0.03 gramme or half grain, will tone a sheet of unenriched paper,

## Notes from the Edinburgh Centre.

(By our District Editor.)

THE members of the Edinburgh Photographic Society held the second of their popular evenings for this session on the evening of Wednesday, 24th ult., in Queen Street Hall, which was crowded. Mr. G. G. Mitchell presided, and in a few neat sentences introduced the business of the evening. This consisted of the passing through the lantern of about 160 slides, the work of twenty-two members during last season. The show was a most creditable one, both as to quality and variety. There were numerous views of foreign parts, chiefly Continental, with a few from places so far distant as Natal and Singapore. In two slides by Mr. J. McGlashen, the Treasurer of the Society, the difficult operation of combination printing had been performed with quite satisfactory results. Mr. T. Barclay, the Secretary, described the views in short terse sentences, which were never tedious, and Mr. J. M. Turnbull handled the lantern with the utmost satisfaction. Music was furnished at intervals, and altogether an exceedingly pleasant evening was spent.

As a sign of, it is to be hoped, returning vigour to the Edinburgh Photographic Society it may be stated that the Council have arranged for three outdoor meetings of members during the ensuing summer. This is a phase of photographic work which no society ought to neglect, and the surprise is that the gatherings of the Edinburgh Society, which at one time were so popular, should have been allowed to fall into desuetude. The Council deserve to be supported in their revival of this most pleasant of all outings. The first of the three events is to be on the afternoon of Saturday, 9th May, most probably to Inverkeithing; and the other two will be on the afternoons of Saturday, 6th June, and 4th July.

Another hopeful sign in the case of the Edinburgh Photographic Society is to be found in a resolution by the Council to offer for competition two medals for the best pictures produced from negatives taken during the current season, and the announcement that the President has intimated his intention to give another. The Council themselves put it that they "had under consideration the comparative falling off in the interest shown by members in the annual show of work," and that the medals are offered "with a view of stimulating this interest," so that the criticisms upon the Society which the AMATEUR PHOTOGRAPHER has been the medium of ventilating are tacitly admitted by the Council. It is announced that the conditions upon which the medals will be awarded have not been finally decided upon, and members are requested to furnish suggestions on the subject.

The festive gathering of which I wrote on the 13th ult. has been fixed to take place in Daish's Hotel, Edinburgh, on the evening of Friday, 6th inst. It is to be independent of all photographic bodies, and will be known simply as a "photographers' supper." Mr. Alexander Ayton, of North Bruntsfield Place, has taken a world of trouble in connection with it, and he is quite sanguine of its success. There used to be an annual feast in connection with the Edinburgh Society, but it, like several other good things, was allowed to die out within the past year or two.

On the same evening, if it be not considered outside of my district, I observe that the members of the Dundee and East of Scotland Photographic Association gave a lantern Exhibition in the Kinnaid Hall, Dundee, before a large audience. Lord Dean of Guild McGrady, who presided, said that the views to be given would be those of "Eastern Cities," and that the lecturer would be the Rev. D. M. Ross. Mr. Ross, he remarked, was a lecturer to whom it was a pleasure to listen, and that night he would describe to them many places which he had recently visited, and give them a lot of valuable information.—The scenes, which were of a high-class order, embraced places of interest in Egypt, Palestine, etc. Mr. Ross's remarks were of a racy and at times amusing character, and were brimful of information. In describing Jerusalem, he said it was one of the dirtiest places in Christendom, and beat Tindal's Wynd and Castle Court, in Dundee, hollow—a remark which drew forth great laughter. The following rather lively description of the meeting is given in the *Dundee Advertiser*, under the signature of "Deborah":—

The members of the East of Scotland Photographic Association and the Rev. D. M. Ross must surely have been delighted at the large company which assembled at the Kinnaid Hall last evening.

Although rime and fog had penetrated the heavy doors, and hung like a thin but quite perceptible mist over platform, area, and galleries, these by no means served as "dampers" to an expectant assemblage. After a pleasant organ recital by Mr. A. M. Stoodle, Mr. McGrady, accompanied by the lecturer, ascended the platform. Just a moment after, presto! the lights are out, and—as perfectly as though each of us possessed the famous wishing-cap—we are spirited away to other climes and scenes. The Rev. D. M. Ross is a clear and fluent speaker, and his enunciation so perfect that it is a pleasure to follow his voice; and with such a leader we could feel almost "at home" even under the shadow of the great Pyramids and the Sphinx. The last of these he introduced to us as "an old friend." Certainly she is "old," and the sight of her battered, noseless, and weather-beaten face—for Mahommedan and Turk have conspired to despoil her of her beauty—awoke a sense of pity as well as awe, "gazing right on with calm, eternal eyes amid all surrounding chance and change." It gives one a very strange feeling," the lecturer remarked, "to look upon the face of the Pharaoh, even although through a glass case, who had seen Moses." Even the photograph of the King stirred some strange thoughts, verily. "Not very beautiful" was the description of him given, having a Roman nose and teeth rather prominent. An irreverent person in my vicinity remarked "The Bogie Man" when his picture was projected on the screen.

Cairo with its mosques and minarets, its strangely-constructed houses and wooden windows, was very attractive, seeming to lie in the light of a warm sunshine. We of modern days would do away, on sanitary grounds, if on no other, with those heavily-blinded windows, which cannot be peered through even without difficulty. But they serve their purpose. As Mr. Ross explained, the wives of the harem may look out without the fear that outsiders will catch a glimpse of one fair face. We saw with interest also the two women grinding at the mill of which Christ's simple language has given so vivid a word picture. From Cairo, after showing us other scenes, the lecturer conducted us to Jerusalem. "Jerusalem is not a large city," he said; one can go round it in three-quarters of an hour," and quite involuntarily there rose to one's lips the words of the old Psalm—

Jerusalem as a city is  
Compactly built together.

But a new Jerusalem is springing up in its immediate neighbourhood. What sacred memories hang about the city! In it and about it

Walked those blessed feet  
Which eighteen hundred years ago were nailed  
For our advantage to the bitter cross.

And yet, and yet, despite dome-roofed houses, its vaulted streets, and olive gardens, "it is the dirtiest city in Christendom, and beats Tindal's Wynd and Castle Court hollow"—so said our lecturer. We paid a visit to the Temple and to the wailing place of the Jews, where that despised people every Friday assemble and chant their prayers for deliverance. The Church of the Holy Sepulchre, the Christian church at Jerusalem, is a splendid and beautiful edifice. Its exterior is fine, and within it has standing room, we were told, for 10,000 or 12,000 people. It was believed for a length of time to have been built on the scenes of the Crucifixion and Burial of Christ, but it has been proved that this cannot be the case. Nevertheless devout worshippers are still found who are eager to enter the tomb where the sacred body is said to have been laid, and to kiss the stone which was rolled in front of it, and pilgrims come from all parts of the world to offer their sacrifices of prayer and praise. The Pool of Siloam was—as Mr. Ross remarked—rather a disappointment. This is no "shady rill, where sweet the lily grows," but a dark, deep, rock-surrounded pool. Jacob's Well was more in accordance with preconceived ideas regarding it. It was not difficult to imagine at its edge the worn and weary teacher and the woman to whom He talked. Many other interesting scenes were visited, and valuable information given regarding them. We saw Russian pilgrims clad in fur while the thermometer showed eighty degrees in the shade; shops, too, gorgeous architecture, etc.

**Whatman's Paper in Germany.**—At a recent meeting of the Praktischer Photographen Berlius, Dr. Heseckel laid before the members some beautiful proofs on his new paper, which is Whatman's rough paper prepared for platinum toning. The results were much admired and created no little astonishment at the artistic results that could be obtained.

**Belfast Y.M.C.A.**—We have just received the prospectus of an exhibition to be held in Belfast from the 27th of April to the 1st of May. There are to be three sections: (1) Confined to members; (2) Confined to residents in Ireland; (3) Open to amateur and professional. In all, there are to be sixteen classes. Silver and bronze medals will be placed at the disposal of the Judges. Mr. J. H. Hamilton, of 14, Wellington Place, Belfast, will gladly give further particulars.

## Exhibitions.

### LIVERPOOL INTERNATIONAL EXHIBITION.

(By Our Special Correspondent.)

TUESDAY night being the last on which I could forward "copy" of the Liverpool show for the current issue of the AMATEUR PHOTOGRAPHER, I left my preliminary view of the exhibits over to the last minute. I have just left the Walker Art Gallery, and am writing these lines at top speed to catch the mail. Mr. T. S. Mayne and Mr. W. Tomkinson, with a staff of men, are still busy "hanging," and I believe there is no probability of their leaving the Gallery until after midnight. A Committee meeting in one of the "half-hung" rooms finished to-night at seven o'clock.

Certainly, the magnitude of the Exhibition strikes one the more one sees it and the more one knows about it. The latest proof of the catalogue received from the printer to-day shows that nearly nine hundred frames are disposed of so far as numbering, etc., are concerned. There yet remain upwards of six hundred frames to be similarly dealt with and got into order. Much the greater majority of the total collection are "hung," only two of the seven galleries not being exactly ship-shape. Of course, there remains some furnishing up to be done, and sundry alterations have to be made, but everything will be in the pink of condition for Friday next, the formal opening day.

I am told by the Secretary that the 1,500 and odd frames sent in embrace about 4,200 pictures, and besides these there are forty sets of lantern slides, in addition to novelties, apparatus, etc. The "hanging" and displaying of these have necessarily taken up a great deal of time. As a matter of fact, at the time of writing, the "hanging" has been going on for something over a week. The decorations—which are to be in blue and gold—are just commenced, and, so far as I could judge, will have a picturesque and pleasing effect. They are artistic and quite in harmony with the other surroundings of the show.

Of the photographic exhibits, those in the Champion Class are, without doubt, a surprisingly large and excellent collection. They cover about two-thirds of the wall space in one of the largest galleries, and all are splendidly "hung." In fact, the "hanging" all through the show has been both carefully and critically carried out. Among the studies in the Champion Class are pictures by Messrs. Marshall Wane, W. W. Winter, R. W. Robinson, R. Keene, Lyd Sawyer, W. J. Byrne, R. H. Lord, A. R. Dresser, J. L. Mackrell, C. Court Cole, etc., etc.

Mr. Wane's series embrace six framed portraits direct from life, 24 by 20 in., printed in platinum (gold medal, International Exhibition, 1890); six framed portraits, direct from life, 24 by 20 in., printed in platinum (bronze medal, Edinburgh Photo. Society Exhibition, 1891); architectural interiors, landscapes, and other studies, instantaneous (Royal Prussian State medal, 1889; medal of Photographic Society of Great Britain, 1889; Berlin Jubilee Exhibition, 1889; first prize gold medal, Cologne, 1889; first prize, Cologne, 1890).

Mr. W. J. Byrne's include Wilhelm Kristean Selle, Mus. Doc., (first medal, Pall Mall, 1890; first medal, Royal Cornwall Polytechnic, 1889; first medal, Royal Cornwall Polytechnic, 1890; first medal, Berlin Jubilee Exhibition, 1890).

Mr. Lyd Sawyer's, medals at Crystal Palace, 1888; World Competition, 1888; Crystal Palace, 1889; Richmond, 1889; Birmingham, 1889; York, 1889; Pall Mall, 1889; Tunbridge Wells, 1890; Coventry, 1889; Pall Mall, 1890; Keighley, 1890; Falmouth, 1890; Edinburgh, 1891.

Messrs. G. West and Sons—Calcutta, 1890; Paris, 1888; Ventnor, 1891; London, etc.

Mr. W. W. Winter's—York, Worcester, Kidderminster, Crystal Palace, Hartlepool, Cornwall, Keighley, etc.

And so on. Mr. Ralph W. Robinson's series of sixty-three "Artists at Home" is unique, and has an excellent position in the champion class room.

Portraiture is very finely represented in the several departments and makes a wonderfully good show. Landscapes, seascapes, marine and cloud studies, animals, instantaneous work, enlargements, and the rest I can merely note only. Taken all round, they are exceptionally creditable, and some of the pictures will prove sensations. Notably the exhibits from abroad show marked quality, and particularly those that I saw from Germany were *par excellence*. As for the mounting and general finish of the pictures in all departments, they are noticeably fine.

Of the lantern slides, which are to be put through the lantern and adjudicated upon to-morrow (Wednesday) night, I am in a position to say that they are a superb lot. The President is of opinion that they show some of the most correct work in this line that he has ever had to do with.

About thirty gentlemen have been invited to the dinner to the adjudicators which is to be given an hour or two before the opening of the exhibition next Friday. Following this function, at which the usual toasts will be proposed, the opening ceremony will take place at 8 o'clock, commencing with a *conversazione*, at which it is estimated some 2,500 guests will be present. An admirable selection of music has been arranged, to be conducted by one of our best local musicians. Indeed, neither time nor expense have been spared to send the show off with *ecclat*.

Concluding, I may point out that it will be of interest to visitors to the exhibition to read the introduction at the front of the catalogue. This has been written by the Secretary and is a terse history of the rise and progress of photography, a history, too, excellently well written and containing valuable hints.

### ROYAL SCOTTISH SOCIETY OF PAINTERS IN WATER COLOURS.

BY ONE WHO DOES NOT KNOW.

MORE than two hundred pictures—none of them too original—are now exhibited at Dowdeswell's.

Mr. Duncan Mackellar gives an accurate interior scene (9), but we might fairly take exception to the mantle-piece. In "The Edge of the Wood" (14), Mr. E. S. Calvert succeeds admirably, and Mr. R. Greenless is especially excellent with cloud effects in a view of "Ptarmagin Hill" (17). Close to "Pond Lilies" (18), on which Mr. S. Reid will be complimented, we caught sight of a village church. If this latter view were placed closer to Mr. Reid's picture, we might entitle the pair "Spires and Pond Lilies"! Mr. H. J. Dobson, depicts "The Frugal Meal" (25) in careful manner; there is not much "grace" before or after this meal. Hearty praise must be accorded to Mr. Robt. Little's "Firelight and Twilight" (28), where the reflection upon the young lady's face is wonderfully well painted. We must be careful—the young lady's face is *not* wonderfully well painted, and we intend no reflection upon her! Impressionism is dying, but dying hard, to judge from the melancholy examples in this Exhibition; *vide* Mr. A. Melville's view of "Henley" (35) at night. The Chinese lanterns are Pain-ful. In "Evening" (36), Mr. Bannatyne has given us a very careful treatment of clouds. This suggested to me a new title for a book—possibly the Editor would like me to write it for the AMATEUR PHOTOGRAPHER Library—"Clouds, and How to Treat Them, by a member of the Bar." Miss. J. Hunter Shield exhibits a pretty study, "Bluebottles" (40), which is, in reality, a vase of cornflowers. Save that the sky is too solidly treated, Mr. C. N. Woolnoth is happy in "Arran from West Kilbride" (44). This artist is also admirable in "The Needles" (46). An extremely awkward young lady figures in Mr. R. Little's "Minuet" (48). No striking originality is shown by Mr. W. Rattray in "Summer Sunshine" (52). We like Mr. J. Maculloch's "Portincape" (54) for its careful and artistic treatment, and Mr. C. B. Phillips, R.W.S., is good in "Strath Avon" (58). A delightful picture of "The Black Linn" (62) is shown by Mr. Waller H. Paton, R.S.A.; and Mr. Otto Leyde's "At Play" (64) is likewise good. The wild landscape in Mr. Mason Hunter's "Scottish Borderland" (69) lacks contrast, and in "Sunset on a Border Moor" (70) Mr. R. B. Nisbet narrowly misses a great success. Mr. Otto Leyde's "Along the Sands" (76) we commend to editors of illustrated magazines; it would make a very pretty coloured frontispiece. The detail in Mr. H. Maxwell's "On the River Nurnberg" (77) is very faithfully drawn, and the picture is good. Mr. G. S. Ferrier has chosen well the landscape he depicts in "Winter Landscape, Earlsdon" (84), and Mr. C. J. Lauder is very happy in his sketch of "Westminster" (85). Mr. J. Maculloch's "Island of Inchbhuidh" (90) is admirable. Mr. John Smart, R.S.A., R.B.A., exhibits a large but not very wonderful picture (113). Miss Shield is careful in "Grouse" (132), but it is really time such studies were excluded from picture exhibitions. Game of this sort is high, by this time, and should be appropriately "skied." Mr. J. R. Houston's "Home Lessons" (138) is another impressionistic study. The choice and care displayed by Mr. R. Greenless in "Glen Strae"

(142) deserve praise. Mr. J. G. Laing depicts "The After-Glow on the Hill" in very natural style. Surely, the bathos of impressionism is reached in Mr. Jas. Paterson's "The Mill" (152). Mr. Tom McEwan gives a fine portrait of an old woman in "Among the Prophets" (176) and a pretty little domestic subject in "Wandering Thoughts" (190). The new A.R.A., Mr. David Murray, sends an excellent view of "The Bridge" (183). Mr. T. Hamilton Crawford is happy in his sketch of the "Interior of St. Paul's" (184), where his perspective is admirable. Mr. R. W. Allan, A.R.W.S., who has been touring through India with Mr. W. S. Caine, succeeds well in "Venice" (192). Mr. Chas. Blatherwick's "Cornisk" (201) is excellent, and "A Forest Glade" (209) by Mrs. G. M. Greenlees deserves a compliment.

**Vogel on Lippmann's Discovery.**—Dr. H. W. Vogel, of Berlin, editor of *Photographische Mittheilungen*, No. 433, says, whilst speaking of Lippmann's discovery: "We note that this principle has already been accurately developed by Dr. Zeuker in his 'Photochromie' (1868), twenty-five years ago. . . . Wiener has proved by photographic experiment the correctness of Zeuker's assumptions, and now Lippmann, by following up the same, has obtained a remarkable result, even if he has only been able to photograph very bright objects, such as the spectrum, and a window lit by the electric light."

**Prouting's Combined Lawn Tent and Studio.**—This accessory to out-door photography has, we understand, been made more efficient than when offered to the public last season. It combines the fittings of a studio with the advantage of an admirable lawn tent. The maker says: "Without impairing rigidity, I have devised a system of jointed poles, and everything fits compactly into a neat wooden case with hinged lid, the outside measurement being about 5 ft. 6 in. by 9 in. by 5 in. The fittings are very complete and of good quality." There are many of our readers who do not "go in" for portraiture, who will gladly avail themselves of one of Mr. Prouting's "Lawn Tents and Studios." We believe they are supplied for £4 4s., and sent carriage paid to any station in the kingdom. Further particulars will be found in our advertising columns.

**Print Washing.**—A correspondent says:—"The apparatus I employ for print washing is of home-made manufacture, and from the work done with it I think it may be considered a success. The washing tank is a large round earthenware dish, about 24 in. diameter and 10 or 12 in. high, such a one as is used in chemical experiments, and known as 'a pneumatic trough.' Over the side of this I hang two or three pieces of bent glass tubing, each forming a syphon. The ends of syphons immersed in the trough are of different lengths, one almost touching the bottom and the others varying from that to about half the distance up the side. This arrangement I leave under the tap, and connect the trough with the tap by means of an india-rubber tube, at the bottom of which is a piece of glass tube to keep it straight. The end of this reaches about one-third way down the trough. The amount of water passed through varies with the number of prints to be washed; the greater the amount of water entering the trough, the more syphons are used to carry it off. To prevent prints floating over the top, I place pieces of smooth wood over the top near the edges, but if water pressure is constant, you can arrange the syphons to carry away just as much as enters the trough, and leave it working for hours without accident."

**The Phenomena of Interference Photographed.**—Now that considerable attention is being directed to this subject, it is interesting to note that an account of the photographing of the so-called Newton's Rings by MM. Baille and C. Féry, in the School of Physics and Chemistry of Paris, is given in *La Nature*, 1890, p. 333, illustrated by blocks, which show first of all the appearance of the spectrum when photographed on an ordinary and an isochromatic plate (Attout-Tailfer), and then the appearance of the usual rings obtained by the presence of air between a convex lens and plane surface. The arrangement of the lens and camera is plainly shown, and also the monochromatic lamp in which chloride of thallium was used instead of chloride of sodium, and the exposure was reduced thirty times, which perhaps might be expected, as the spectrum of sodium is the well-known D lines, and that of thallium a line in the yellowish green about D<sub>3</sub>E, a point where there is a maximum of sensitiveness for erythrosin plates. By measuring the diameter of the rings obtained in both cases, that is, with the soda and thallium flames, one can determine the relation of wave lengths of both sources of light. Baille and Féry found  $\frac{\lambda}{X} = 1.09$ , from which the wave length of the thallium flame can easily be reckoned: thus  $X = \frac{\lambda}{1.09} = \frac{589\mu}{1.09} = 540\mu$ , the actual wave length of the thallium light.

## Quarterly Examinations in Photography.

**Question 16.**—Give directions for sensitising albumenised paper.

**ANSWER.**—In buying albumenised paper the dealer will tell you what strength silver bath it requires, as it depends to a certain extent on the amount of chloride of ammonium used in albumenising the paper. The silver bath can be varied to suit different classes of negatives. With a dense negative a bath of 30 to 40 grs. to the ounce will be found sufficient; with a weak negative, a bath of 70 to 80 grs. may be used with advantage. The following is a very good bath for ordinary work—

Nitrate silver, 50 grs.; Distilled water, 1 oz.

Test with blue litmus paper. If acid, neutralise with carbonate of soda. The bath becomes weaker with every sheet of paper sensitised; to obviate this a solution of 200 grs. nitrate of silver added to 2 ozs. of distilled water, and for every sheet of paper sensitised 2 drms. of this solution are added to the bath. The solution should fill the dish about half an inch. Float the paper by taking hold of the two diagonal corners, then by bringing the hands together a curve will be formed. The middle will be the first part to touch the solution; by lowering the corners the bubbles will be driven to the edge. After leaving it on the bath for about one minute, raise the paper, to see if there are any air bubbles; if so, they must be broken with a quill. Then put it down on the bath again for about another two minutes; leave the paper longer in winter. It should be drawn over the edge of the dish, to remove solution, hung up till surface dry, and placed between clean blotting paper.

This paper will not keep longer than a week, unless preservatives are used; the best method of preserving is to soak chemically pure blotting paper in a solution of carbonate of soda 1 in 20; when this is dry, lay with the sensitised paper alternately in air-tight box under pressure; it will keep thus for a month. E. B.

**Question 17.**—A batch of prints refuse to tone. What are the probable causes of, and how would you set to work to find out and remedy this fault?

**ANSWER.**—The most probable causes of prints refusing to tone, are (1) the acidity of the bath, and (2) of the prints themselves in ready sensitised paper; (3) small amount of gold in the bath; (4) excessive washing before toning in some cases.

(1 and 2) Acidity. This may be detected by litmus paper, and corrected by the addition of pure chalk or sodic carb. just before toning, and allowing the bath to settle before using. The auric chloride generally contains free acid, although the bath may have been made with sodic carb., yet it becomes acid again by the immersion of ready-sensitised paper, which contains an acid (citric or tartaric) in order to preserve it.

A good plan is to wash the prints in a weak solution of waashing soda before toning.

(3) Want of gold. Baths should always be strengthened before use, and after use a few drops of acetic acid added, and the bath filtered and kept in the dark. If this is not attended to, the gold settles down as a fine black or purple deposit, and so weakens and fouls the bath.

(4) Excessive washing. In a toning bath made up with chloride of lime, it is advisable to leave a little of the free silver salt in the prints for toning. LINDUM.

**Question 18.**—What is the best method of washing prints?

**ANSWER.**—The simplest way of washing prints is to soak them for, say, three hours, in a large basin of water, changing the water every quarter of an hour. Each time of changing water the prints should be taken out one by one and allowed to drain before placing them into the clean water. Two or three times also during the three hours, they should be taken out separately, laid face upwards on a sheet of glass, and thoroughly well sponged. They will then be found to be free from any traces of hypo. If the time necessary for this process cannot be afforded, and if there is a constant supply of water available, recourse must be had to a mechanical washer. The supply of water should come in at the bottom of the tank, and be so arranged as to keep the prints always in motion, the waste water being drawn off at the bottom. One of the best forms is that in which the water is allowed to enter the tank over a small water-wheel, by means of which it is caused to rock, a perforated tray holding the prints. The water is allowed to run in slowly, and when it reaches a certain depth a syphon comes into action and continues to draw off the water until the tank is emptied, when it again begins to fill, and so on. The prints are thus alternately soaked and drained, whilst the rocking of the tray prevents them from sticking together. WORFIELD.

Papers have been received from and marks awarded to A. C. S., Worfield, Lindum, R. C. M., Electra, Biarritz, Sunesis, Developoid, E. B., Spain, C.

## Societies' Meetings.

**NOTE.**—In this column the Editor can of necessity only give a brief summary of the proceedings. Papers read before societies will appear in the PHOTOGRAPHIC REPORTER, and the Editor of the REPORTER will be glad to receive reports for insertion as early as possible after the meetings have been held.

**Barrow-in-Furness.**—The Photographic Section of the Barrow Naturalists' Field Club held their monthly meeting on the 26th ult., Mr. W. Dunlop, Vice-President, in the chair. Mr. John Redhead read a paper, the first part of which was on "A Holiday Tour in Wharfedale and Wensley Dale," and the second part "A Tour in Clapham, Ingleton, and Kirkby Lonsdale District," which were illustrated by about fifty slides, including some of Fountains Abbey. The slides were of a very high order, and a great many were deservedly applauded. Mr. Redhead consented to exhibit his slides again on the 9th inst., at the general meeting of the Club. Mr. J. T. Hynes and Mr. J. P. Smith were elected members of the section.

**Birmingham.**—The ordinary meeting on the 26th ult. was the first of a series of meetings to be held in the Midland Institute. There were seventy-nine members present, Mr. Alex. Tucker, C.E., in the chair. Mr. A. J. Leeson gave a paper on "Photographic Shutters." He said that the object of the paper was to bring before the members some of the different shutters at present in the market, with explanations of their mode of working and in some of the fastest giving the speed as tested by himself, and Mr. Jerome Harrison, with Underwood's shutter-testing chronograph, which was worked with an "Otto" gas engine. The shutter registering the highest speed was Marion's (Bain's patent) Crown shutter, which gave a speed of  $\frac{1}{10}$  sec.; the Caldwell shutter gave  $\frac{1}{100}$ ; the Kershaw shutter ( $\frac{3}{8}$  in. aperture),  $\frac{1}{100}$ ; Underwood's Instantolux,  $\frac{1}{100}$ ; Shew's Eclipse (and the Mattioli),  $\frac{1}{100}$ ; Thornton Pickard,  $\frac{1}{100}$ ; Thornton Pickard (double blind,  $\frac{2}{3}$  in. aperture),  $\frac{1}{100}$ ; Sands and Hunter's,  $\frac{1}{100}$ ; Voigtlander's Sector,  $\frac{1}{100}$ . The speeds of other shutters tested were given, and shutters were exhibited made by Messrs. Wratten and Wainwright, Wray, Marion and Co., Thornton-Pickard (including their Faintbreak, with their stereoscopic), Shew and Co., Tylar, Place, Underwood, etc., and also the Guerry Flap, Wollaston's Diaphragmatic, Newman's, new Kodak, etc. The Chairman announced that the large number of shutters Mr. Leeson had placed on the table would be on view after the discussion, instead of handing them round the room during the reading of the paper. Mr. W. J. Harrison then gave a short paper on "Instantaneous Photography." He said that Goddard first made instantaneous photography possible in 1841, by his discovery of the extreme sensitiveness to light of silver bromide. Five things were necessary to secure an instantaneous picture, viz., a good light, suitable shutter, lens, plate, and camera. The time of the year when instantaneous work could be best practised was from March to September, and the time of day between 10 o'clock and 3 o'clock. Speaking of shutters, he said most of his successes had been achieved by means of the Grimstone. Mr. Harrison exhibited the new double hand-camera by the Stereoscopic Company, and took several flash-light pictures of the audience by means of Hibbert's repeating flash-lamp.

**Brighton.**—The last meeting was held on the 24th ult. The President, Mr. J. P. Slingsby Roberts (in the chair) delivered his inaugural address, which was listened to with much attention, and a good discussion ensued.

**Croydon.**—The fortnightly meeting was held on Monday, the 2nd inst. Mr. Burroughs and Mr. Goddard were elected members, and four other gentlemen proposed. The subject of the evening was "Lantern Slide Making by Contact Printing," which was ably handled by Mr. C. F. Oakley, working with Thomas's plates. Both pyro and hydro were in turn used, and a large range of tones obtained. The value of toning after development was emphasised where a slide, from under-development or other causes, is lacking in density. Subsequently, a number of brilliant exemplars of Mr. Oakley's skill were thrown on the screen, and elicited much applause from a crowded audience. The Society continues to grow so rapidly that the executive are beginning to consider whether the present spacious meeting-room is large enough. The tickets for the annual dinner on Monday, the 9th inst., are being rapidly taken up, and a large and influential company is expected. Gentlemen desiring to attend should make immediate application to the Hon. Sec. On Monday, the 16th, Mr. A. E. Isaacs holds forth on "Lenses," including the theories and practice involved in their use for photographic purposes.

**Darlington.**—The annual conversation in connection with the above Society took place in the Mechanics' Hall on the 27th ult. The hall was tastefully decorated and furnished. There was on view a large collection of photographs, the work of members, including those sent in for the annual competition in January, and also a great many enlargements, chiefly pictures which had won prizes in previous years. Mr. E. Ensor (Vice-President), in the unavoidable ab-

sence of the President, welcomed the guests, and remarked that the Society was doing good work and increasing in membership. This was the first year there had been an open class, and it was hoped that next year, when more publicity was given to the fact, there would be a much better exhibition. The Mayoress of Darlington (Miss Barron), who was accompanied by the Mayor (Mr. T. M. Barron), gracefully presented the prizes to the successful competitors as follows:—Class I. (Open to members): 1st, Mr. T. Howlett (a 24 in. by 18 in. enlargement of "Oban Bay"); 2nd, Rev. C. G. Davis, AMATEUR PHOTOGRAPHER Bronze Medal for the best single picture; Mr. T. Howlett, "The Loose Shoe." Class II. (Open): 1st, Mr. T. Howlett (24 in. by 18 in. enlargement), "In Castle Eden Dene;" AMATEUR PHOTOGRAPHER Silver Medal for best single picture, Mr. E. Barker, West Hartlepool, "Aberdovey," North Wales. Class III. (Lantern Slides). 1st, Rev. C. G. Davis; Photography Bronze Medal for the best single slide, Mr. T. Howlett, "Oban Bay." Mr. R. A. Luck thanked the Mayoress for presenting the prizes, and remarked that it was the first time a member of the Society had held the honourable position of Mayor. About 150 lantern slides were then passed through the lantern and proved a most interesting feature of the evening's entertainment. A capital string band was in attendance, and played selections at intervals. There were about 200 guests present.

**Dukinfield.**—At the first weekly meeting for practical demonstrations on the 25th ult., the President, Mr. W. H. Shirley, presiding, Mr. John Winterbottom, Hon. Treasurer, gave a demonstration on "Alpha Paper." After a few pointed remarks and very practical hints on the method of working this paper, he proceeded to develop several pieces previously exposed, with a view to showing the various tones to be obtained by different methods of treatment, and obtained a very satisfactory series of results. The opinion of the members was that Alpha was one of the most useful papers on the market.

**Guildford.**—On the 24th ult. a meeting and conversation were held at the County and Borough Halls, Guildford. Despite the inclemency of the evening, there was a good attendance of members and friends, including a number of ladies, who took great interest in the proceedings. The President of the Society (Mr. G. J. Jacobs, F.R.A.S.) delivered a very interesting address, pointing out the uses and advantages of photography, not only as a pastime, but as an aid to the advancement of science. He alluded to the recent reports as to the discovery of photography in colours, and pointed out the application of photography to ascertain the motions of the stars and the identification of their constituent substances. This portion of the lecture he illustrated by negatives of star spectra taken at Harvard University, U.S.A., by Professor Pickering. He then gave a brief description of modern flash-light photography, illustrating his remarks by taking a flash-light photograph of the meeting. An exhibition of lantern slides by gold medalists, kindly lent by Messrs. Mawson and Swan, then took place, the lantern being most efficiently manipulated by Mr. Martin, microscopist, of Guildford, who, it will be remembered, rendered similar service with so much success at Dr. Dallinger's lecture some time ago. A number of lantern slides by Mr. J. Russell followed, and were much appreciated. There was a good display of prints and photographic apparatus by members.

**Hackney.**—There was a lantern exhibition on the 26th ult. In giving out the Society announcements, the Secretary remarked that he was glad to be able to congratulate one of the members, Mr. S. H. Barton, on having won the AMATEUR PHOTOGRAPHER first prize for lantern slides. Amongst the members who showed slides were Messrs. Dean, Avent, E. G. F. Jones, Herbert Smith, Barton, and Gosling. Messrs. T. A. Salmon and J. Harverson were nominated for membership.

**Harrogate.**—A meeting was held on the 3rd ult., Dr. A. G. Russell, J.P., President, in the chair. Mr. A. A. Pearson, of Leeds, read a very interesting paper on "The Chemistry of Photography," which he illustrated with numerous experiments.

**Huddersfield.**—The ordinary meeting was held on the 25th ult., Mr. T. K. Mellor, Vice-President, in the chair, when the AMATEUR PHOTOGRAPHER Prize Lantern Slides were exhibited to a somewhat small audience. Some of the sets of slides being very fine were received with acclamation. Samples of the Barnet plate, sent by Messrs. Elliott and Son, were also distributed.

**Isle of Thanet.**—Ordinary meeting held February 25th. Mr. A. Vigar gave a practical demonstration on "Photo-Micrography," before a well filled meeting, Mr. W. Saunders, Vice-President, occupying the chair. Several fine quarter-plate photographs of microscopic objects were exhibited by the demonstrator, who also carefully illustrated the whole process, from focussing up to the production of the finished negative.

**Keighley.**—The annual meeting of this Association was held on the 24th ult., Mr. Alexander Keighley in the chair, when there was a good attendance. Mr. Keighley briefly referred to the successful career of the Association since its formation, particularly last session, and went on to say that the exhibits of the members at the recent institute conversations far exceeded the expectations of the Com-

mittee and showed the interest that was manifested in the work of the Association. The show of pictures was an excellent one and far exceeded the exhibition of the previous year. The balance carried forward was favourable, and some of the excursions had been well attended and good results obtained. The following members were elected officers for the year: President, Mr. Samuel Banstow; Vice-Presidents, the Rev. T. Mellorey and Mr. Alex. Keighley; Treasurer, Mr. Walter Mitchell; Committee, Messrs. Thos. Heaps, A. Haggas, E. Myers, A. N. Kershaw, R. Timson, R. Smith, and C. Smith, with Mr. John Gill as Secretary. At the conclusion of the annual business, Colonel Sugden gave a very interesting lecture on "Ancient Egypt," which was graphically described and illustrated by a fine and extensive collection of views of the most noted ancient temples, colossal statues, and other large and interesting relics of olden times. The principal dimensions of some of the larger temples, the weight and size of some of the stones used in the buildings, and the distance these had to be conveyed from the quarries, showed that great ingenuity and mechanical skill must have been exercised by this ancient and interesting people.

**Lancaster.**—At a meeting held on the 24th ult., Mr. J. W. Pickard, Vice-President, in the chair, the No. 1 Monthly Competition Lantern Slides lent by the AMATEUR PHOTOGRAPHER were on view. In addition to these, 132 slides by members of the Society were passed through the lantern by Mr. J. H. Storey, who, using the etho-oxygen lime-light, obtained splendid results. The slides were freely criticised. Three new members were proposed.

**Leith.**—There was a lime-light exhibition of a miscellaneous collection of photographs, the work of the members of the society, on the 24th ult., and from first to last it engaged the interest of a large audience. The examples of art thrown upon the screen included remarkably fine specimens, which had secured high honours in open competitions for amateurs, and all the pictures shown displayed at once an effective taste in subject and a superior skill in reproduction. Mr. William Dougall (President) occupied the chair. Having welcomed the large audience, he went on to say that the association was a very young one, yet he thought its short history both interesting and promising. Composed entirely of amateurs, and numbering only some forty members, including two young ladies, still, several substantial prizes, won in open competition, had come to individual members, as already noticed in their annual report. That was the third annual exhibition of members' work and these popular evenings were given, first, for the entertainment of their friends, and, next, for giving a zest to the efforts of the members in the pursuit of their delightful art, and, lastly, for inducing others to join the association. The slides to be shown were, of course, a miscellaneous collection, and would not admit of any connected description. Some of the happy hunting-grounds of the young photographer occurred pretty often, but there were many scenes less familiar, and these would be shortly described by Mr. Hunter. He trusted their efforts to please would be successful, and might be the means of inducing both young men and maidens fair to join the society. Mr. A. D. Guthrie, who manipulated the lantern, then put the slides through. Music was provided at intervals.

**Liverpool.**—The second ordinary meeting of the twenty-eighth session was held at the Association's Club-rooms, 3, Lord Street, on the 26th ult., Mr. Paul Lange (President) in the chair. The following were unanimously elected members of the Association, viz., Robert W. Hill, James H. Wood, T. F. Lloyd, Thos. Cook, Wm. Cook, J. Bardsley, Mrs. Marriott, and Jos. Robinson. Mr. Sinclair was elected an hon. member of the Association. Mr. Cade (Messrs. Marion and Co.'s representative) exhibited and explained their new hand-camera for 1891, "The Radial." A paper and demonstration on "Eikonogen v. Pyro," was then given by Dr. B. Jumeaux, of the Manchester Amateur Photographic Society, and the meeting terminated with a vote of thanks to the two gentlemen who had come from such a distance.

**Peterborough.**—The monthly meeting was held on the 2nd inst. The lantern slides entered for the competition, after being exhibited on the screen, were judged by the members by ballot, the winners being Nicholls first, Perkins second, and Noakes third. The Secretary read notes on "Comparative Rapidity of Lantern Slide Emulsions."

**Pudsey.**—This newly-formed Society held its second meeting on the 24th ult., a good number being present. After the business of electing the officers had been gone through, a bi-unial lantern was brought into use and over 150 slides were passed through. The quality of work put upon the screen showed that, although new to the Society, some of the members were old hands at slide making. A most enjoyable evening was spent. Four new members were enrolled.

**Richmond.**—At the weekly meeting on the 27th ult., Mr. C. H. Davis in the chair, the accounts of the recent lecture by the President, Major J. Fortuné Nott, were submitted, showing a balance of £4 available for the Richmond Hospital. Failing a promised demonstration, there was no special subject on the programme, but an interesting discussion took place, turning chiefly upon dodges in the

development and mounting of lantern slides. The conditions were settled for a lantern-slide competition.

**Shoreditch.**—The first meeting in connection with the proposed Shoreditch Photographic Club will take place at the Coffee Rooms, 151, High Street, Shoreditch, on Wednesday, 11th inst., at 8.30 p.m.

**Shropshire.**—Upon the occasion of the last meeting of the members of the Shropshire Camera Club, the President, Mr. Greateorex, read his inaugural address, which was listened to with much interest; there was on the same evening an exhibition of photographs and lantern slides. No less than 600 invited guests were present.

**The Photographic Society.**—At the monthly technical meeting held on the 24th ult., Mr. Leon Warnerke, Vice-President, in the chair, Mr. G. F. Hayward exhibited some daguerreotypes taken in 1842-3 and a positive taken about 1844. Mr. W. E. Debenham then opened a discussion upon the dark-room and its fittings. He first described the window of the Society's dark-room. A sheet of pot yellow is fixed in the window; inside that are a series of sliding panels filled with ruby fabric, golden fabric, a yellowish-green glass, and a deep ruby glass. He then described a number of lamps exhibited by various firms, and said that another useful addition to a dark-room was a drying box for drying plates that had been backed. The Chairman said that for backing plates he used a mixture of glycerine and gelatine, such as is sold for copying purposes. Mr. E. Clifton thought it was impossible to obtain optical contact in this way; he found ordinary Brunswick black made a good backing. Mr. W. E. Debenham considered the worst black of all was bitumen and lamp-black ground together. Mr. E. Clifton considered that a plate rocker was extremely useful in the dark-room, as it enabled one to go on with other work while a plate was developing. The Chairman described a lamp he used when travelling. Mr. W. E. Debenham drew attention to some celluloid dishes that were exhibited. Mr. E. Clifton mentioned that they softened if used with methylated spirit. Mr. W. England then showed his travelling dark tent. The Chairman then referred to Lippmann's photography in colours. A discussion ensued, in which Messrs. Debenham and Lawrance took part. The following is the list of exhibits:—Messrs. Vevers, Leeds, simple folding lamp, dropping tube, and minim measure, Kinnear's gas tap and plate-lifter; Messrs. J. Preston, Leeds, Chameleon lamps for oil and gas, Argand burner with ruby chimney, and celluloid dishes; Messrs. Reynolds and Branson, lamp, with pass giving white or ruby light at will; Messrs. Benham and Froud, candle lamp; the London Stereoscopic Company, a large dark-room lantern; Messrs. J. J. Griffin, celluloid dishes, weights and measures.

**Toynbee.**—On the 24th ult. Mr. H. Dalton read a very interesting paper, entitled "Camping and Tramping in English Lakeland," an account of a holiday spent in that district, and illustrated by some sixty views taken during the tour. A description of camp luggage and photographic apparatus was given. There is little difficulty in obtaining suitable camping ground, and very beautiful pictures of places, quite away from the route of the usual tourist, were shown. The evening closed with a number of humorous slides by Mr. Coade, copies of Ally Sloper's difficulties upon his various half-holiday excursions.

**West London.**—At the meeting on the 27th ult., Mr. W. A. Brown in the chair, the Secretary read a letter from Mr. Biden, requesting the Society to send a deputation to a meeting he had convened to consider the federation of the various societies and other matters. It was determined that the President, the Hon. Secretary, and Mr. Hodges be requested to attend the meeting, but not in any way to pledge the Society. The question as to the Society entering for the Crystal Palace Challenge Cup was brought forward by Mr. Hodges, and it was decided that the Society should take steps in the matter. Members were requested to send pictures in to the Society's room to be selected from by the Committee of the Council on the Saturday succeeding the next ordinary meeting. Some slides were then put through the lantern.

**Woolwich.**—A lantern evening was given on the 26th ult. at the Y.M.C.A. Institute, No. 1, Conduit Road, Plumstead. The slides, which included a great variety of subjects, were lent by Messrs. Mawson and Swan, and were of excellent quality.

**Sale of the Photographic Apparatus, the property of the late Archbishop of York.**—The following prices were realised:—A Watson and Sons light Premier Camera, 12 by 10, brass bound, six double dark slides and two solid leather cases, 16½ guineas; a Meagher portable bellows camera, 12 by 10, two double dark slides and one single, 9 guineas; a Meagher portable bellows camera, 7½ by 4½, with six double backs and two leather cases, £5 10s.; a Dallmeyer lens 6D, 15½ guineas; Voigtlander, No. 3A Euryscope, £5; ditto 5A, 16½ guineas; ditto landscape No. 6, £5; Suter A3, £5 10; ditto landscape No. 4, £4; ditto No. 3C, £4 15s.; ditto No. 2E, £2 10s.; a pair of stereo lenses, by Grubb, £1 6s. All were in first-class condition, the large camera apparently scarcely used. The total result of the sale was about £120.

## To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance, the number and full title of the query referred to.

## QUERIES.

4543. **Barnett's Dark Slides.**—Will any amateur who has used Barnett's dark slides, sold by Chadwick, of Manchester, tell me if they are good? They are cheaper than the slides at present in use.—**R. GORDON.**

4544. **Developers.**—Would any one inform me on these two points: (1) Which is on the whole the best developer? (2) Which is the best for a beginner?—**IGNORAMUS.**

4545. **Permission to Photograph.**—Will some amateur please tell me to whom am I to apply for permission to photograph in the following places: the Zoological Gardens, London; Hyde Park, London; Hampton Court, Kew Gardens, Windsor Palace? Any information as to where a permit can be had will oblige.—**A STRANGER.**

4546. **Mounting Opals.**—Will some one tell me the best way to mount photographs on back of glass as sold in shops, called opals?—**D. B.**

4547. **Victoria, Australia, Photographic Apparatus for.**—Enquirer, who is leaving for Australia in April, where he purposes residing, would feel greatly obliged for any advice on the subject. He has already a Rouch's whole-plate and Abraham's hand-camera, the one made by him previous to his "Ideal," but though he has been very successful with it, he thinks of disposing of it and buying another make less liable to require repairs. There being so many various makes, enquirer finds great difficulty in deciding what make to purchase, and will be grateful for any advice on the subject. Are the Ilford plates suitable for the warm, dry climate of Australia, and can they be bought in Adelaide at reasonable prices? Any hints for photographing on the voyage will be very acceptable.—**AUSTRALIA.**

4548. **Enlargements.**—Will some reader inform me how to make enlargements in carbon?—**R. H. D.**

4549. **Book on Toning.**—Can any one recommend me a good book on toning, where to get it, and the price?—**AMATEUR.**

4550. **Exposure.**—What exposure should be given to a water-colour painting, placed on a chair in a studio, at about 9 ft. from a large window, good north light, half-plate camera, rapid rectilinear lens? What time of day this month would the light be best, supposing the weather clear and bright?—**A. F. B.**

4551. **Florence, Exposure at.**—Shall be glad to know about exposure in Florence during April. How does it compare with England in the same month?—**KITTY.**

## QUERIES UNANSWERED.

- Feb. 13th.—Nos. 4500, 4503, 4508, 4509, 4510.  
 „ 20th.—Nos. 4512, 4514, 4517, 4519, 4520, 4521, 4522, 4523, 4524, 4525, 4526.  
 „ 27th.—Nos. 4527, 4528, 4530, 4531, 4534, 4535, 4537, 4538, 4539, 4540, 4541, 4542.

## ANSWERS.

4532. **Celluloid Films.**—(1) **E. H. Fitch**, 34, Angell Road, Brixton. (2) Yes, but more expensive. (3) Yes, results in my experience far ahead of glass plates and quite as easy to work.—**J. E. BLISSAM.**

4529. **Developer Ready-made.**—There are so many of these now on the market that are suitable, more or less, for the plates mentioned, that it is almost impossible to choose one more than another. The shortest way, perhaps, would be to get one of the Ilford formula made up specially at the nearest photographic chemist's. The following are specially recommended by the Ilford plate makers:

No. 1.			
Pyrogallie acid	...	...	1 oz.
Bromide of ammonium	...	...	600 gr.
Water, to make	...	...	6 oz.
Pure nitric acid, exactly	...	...	20 drops.
No. 2.			
Liquor ammonia '880	...	...	3 drm.
Water	...	...	20 oz.
No. 3.			
Solution No. 1	...	...	1 oz.
Water	...	...	19 „
Developer, equal parts Nos. 2 and 3. Or:			
No. 1.			
Hydroquinone	...	...	160 gr.
Potassium bromide	...	...	30 „
Sulphite of soda	...	...	2 oz.
Water, to make	...	...	20 „
No. 2.			
Soda hydrate	...	...	100 gr.
Water	...	...	20 oz.

Developer equal parts. If this is not convenient, no doubt one of the following could supply the necessary article: **E. G. Wood**, 74, Cheapside, E.C.; **Abrahams**, 81, Aldersgate Street, E.C.; or, **Price**, **Talbot**, and **Co.**, 29, Ludgate Hill, E.C.—**WIZARD.**

4529. **Developer Ready-made.**—Can well recommend the Perfection developer, sold by **J. Beau**, New Road, Weybridge. This is excellent for ordinary and rapid work, and keeps well. I have used it for bromide papers, opals, and lantern slides with equally good results. The best all-round developer ever used, price 2s., sufficient to make 40 oz. developer.—**B. H. S.**

4529. **Developer Ready-made.**—A most reliable hydroquinone developer in two solutions is sold by **Hethon Lewis**, of Lansdown Road, Brighton, which gives excellent results with the plates mentioned.—**PHOTO-ROVER.**

4533. **Bicycle Carrier.**—Carson spring carrier is about the best made. I have used one for two years with the same sized camera and have never been troubled with pinholes. Their address is 22, Batchelors' Walk, Dublin.

4533. **Bicycle Carrier.**—If "W. G. O." will look me up at 55, Winchester House, E.C., any day before the 10th of this month, he can see a saddle bag arrangement for carrying a half-plate kit on a safety bicycle, which I find works exceedingly well.—**E. W. T. WARD.**

4532. **Celluloid Films.**—**J. D. England**, 21, Charles Street, Queen's Road, makes what you require. The results are equal to glass.—**PHOTO-ROVER.**

4532. **Celluloid Films.**—Write to **London Stereoscopic Co.**, 54, Cheapside, E.C.; or, **Horne**, **Thornthwaite**, and **Wood**, 416, Strand, W.C. Have seen excellent results from both.—**WIZARD.**

4536. **Varnishing.**—A negative may be retouched either before or after varnishing, but it is advisable for a beginner to work over the varnish, as the film, being thin, an inexperienced worker is apt to make a hole through it if not protected by the varnish. Many good professional retouchers get rid of the larger "patches" on the naked film and then work up the "fine grain" over the varnish.—**WIZARD.**

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S POST if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—**ED: AM: PHOT:**

**NOTE.**—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.

**E. A. YERBURY.**—No. 2 lens is the most suitable, and the shutter named will do all you will ever want.

**E. S. D.**—Mouldy hypo solution is not uncommon; the only thing to do is to bottle it each time after use, and keep the bottle well-corked. A concentrated solution may be made by putting 1 lb. of hypo in a bottle and pouring on to it sufficient hot water to make 48 oz. of solution, the bottle being previously marked by a file or a diamond at the place where this quantity of water comes to. The acid fixing bath is used for negatives to remove pyro stains and harden the film. It can be made by dissolving ½ oz. of tartaric acid in a little water, adding this to 2 oz. of sulphite of soda previously dissolved in a little hot water, and mixing the combined solution with solution of 1 lb. of hypo. We never use anything else for plates now, Ammonia is added to a

fixing bath when it is to be used for prints to neutralise any possible acidity which would cause yellowing and blistering of the albumen.

**BEGINNER.**—(1) Send us up the formula of your ell-onogen solution, and then we can help you. It will still develop, though as black as your hat. (2) The cloudy or foggy patch is "flare," and is a necessary evil from using a lens for the purpose for which it was never intended. See the answers in Quarterly Examinations in photography a week or two back.

**VALOIS.**—The yellow colour of the fixed print is a natural and inevitable sequence from the omission of the operation of toning. There is no possible way of making any print retain the colour it receives during the operation of printing except by toning. If you like to send us up three untuned prints of the colour you so admire we will endeavour to obtain it for you and tell you our method of doing so.

**O. E. F.**—Ask your local chemist, ironmonger, or grocer.

**P. A. WILLIS.**—Probably; if brass, ask the maker. **R. H. D.**—We know nothing of the camera mentioned.

**W. J. D. WALKER.**—Have replied as requested.

**R. W. SAVAGE.**—Communicate with Messrs. Hart and Co. (see advertisement) We have also written to you.

**H. J. FISHER.**—Many thanks for slide, which we much appreciate, and shall have great pleasure in showing the same whenever the slides are exhibited.

**G. BINGLEY.**—The slides are safely to hand. It is kind of you to have taken so much trouble for us.

**E. M. TUNSTALL.**—Many thanks for the paper, which we will have set up.

**W. W. H.**—Your prints look very much as though the hypo solution was slightly acid. Add ¼ oz. of carbonate of soda to every pint, and then try again; if you have no better success we will tone some prints for you, and explain our procedure.

**W. T. PHILLIPS.**—Your letter to hand, and contents noted. We will write you as soon as we get lens.

**LEX.**—You are probably wrong in exposing. The exposure would be about four or five times that for the plate you have been in the habit of using. Reduce the aperture of your existing shutter. Thank you for the print, which is a curiosity. We have a very fine set, sent by another correspondent, of same subject.

**VINDEX.**—We should advise the longer-focus lens. The same lens would be useful for a shorter-focus camera. The only disadvantage with a long-focus lens is that the object is larger, and one has sometimes to get inconveniently distant from object to include it all on plate; still, we should choose the longer focus. The quinol developer mentioned in your note will keep, but add 1 dr. of sulphurous acid to the sodium sulphite dissolved in water, and pour on quinol; shake and bottle.

**T. S. FRASER.**—(1) The outfit seems all that can be desired. (2) For architectural work, it is absolutely necessary to have a swing-back as well as sliding fronts; with this proviso the apparatus would be suitable.

**ISCA DANEMORUM.**—Any W.A.R. lens will cover well in a hand-camera, and be in focus beyond a certain distance, which is dependent on length of focus and ratio aperture. As a rule, these lenses work at too small an aperture. No. 2 lens is certainly the most suitable.

**H. BECKLEY.**—The print sent is of good quality, and we should certainly advise you to enter our competitions. We have many a worse print than yours sent in.

**J. H. SAW.**—The larger-sized camera with longer focus lens would certainly not work so well at fixed focus as the small one you have. We should like to write you by post, if you will forward address and state focus of present lens.

**PRO.**—It is impossible to make a satisfactory solution within the limit you name, i.e., 6 oz. We should advise you to get some acid sulphite solution, and use 1 oz. of this instead of 1 oz. of water. We shall be pleased to give further help if desired.

**AUBURN.**—There is no joke in the matter at all, but the thing is an actual fact, and one can obtain negative or positive results according to the length of exposure, which is extremely difficult to hit correctly. Let us know a few more details, and we will help you further.

**H. H. COBB.**—The fault is in using bromide of ammonium with metabisulphite; the latter constantly keeps getting more and more acid, and there is a general interchange of partners. Replace the ammonium bromide by potassium bromide, and it is certainly advisable to use distilled water. The reduction of ammonia in Solution B will only mean a little longer developing, that's all. Cut a cardboard, or sheet of tin foil, with a square aperture, and glue or nail on the front of the printing frame, and keep the frame in constant and quick motion whilst exposing; move the frame in all directions, up and down, sideways, etc., so as to prevent sharp outlines of vignette showing.

**MANCUNIAN.**—You cannot do better than fix on the camera and slides of which you send description; we know them both to be good articles.

**NOVICE.**—Every negative is over-exposed, and probably insufficiently developed. The colour of the

print of dog is a purple, and is probably obtained on home sensitised paper. You might try the chloride of lime bath. Always pleased to help you.

**JOHN RILEY.**—Your lubricant is a little too strong, or you may be using "finish," and not methylated spirit. Dissolve three grains of Castile soap in an ounce of pure methylated spirit; when the mount and print just begin to curl with the print inside the curl, rub on the lubricant with a soft pad, and allow to curl up again slightly; then pass through burnisher, which should be as hot as the back of the hand can bear, three or four times, then set up on end singly to dry. Never use dry soap. Let's hear from you again.

**ACHILLES.**—We know nothing of No. 1. No. 2 we have tried, and can say they are as good and reliable as any at the price. No. 3 we have written to make about, and shall probably notice.

**R. J. GLANVILLE.**—The gateway is particularly uninteresting, and calls for no comment. The trees would have been decidedly better if slanting across the plate, and both prints would have been better if done on bromide paper. Neither is hardly up to competition standard. Let us see some more work again.

**R. HAILS.**—We can only answer your questions by actually examining the lens, and you will find full directions how to do this in our issue of Jan. 2nd, page 16. All single lenses distort buildings, therefore yours will, but as this distortion is only apparent by mathematical measurements, you may make your mind easy on that score. If, after trying, you cannot actually do as suggested above, forward us the lens, and we will help you.

**J. E. T.**—We have not yet seen the hand-camera, though we have been promised one as soon as they are ready.

**HYPO.**—We should certainly recommend one of the larger-sized No. 5.

**F. KELLY.**—(1) About 75s. per oz. R. Pringle and Co., 40, Clerkenwell Road, E.C.; J. Blundell, 162, Wardour Street, W.; E. Day, 28, Warstone Lane, Birmingham; Johnson and Matthey, Hatton Garden, London. Weigh your crucible, and write and ask for an offer. (2) In following order—3, 4, 1, 2, 3, 4, and 1 can be obtained in white or tinted; 2, tint only. (3) By all means keep to the plate you are using, or else try No. 2. (5) Questionable; we shall have a leader on this shortly. (d) No. 1 or No. 4; in preference, the latter.

**AMATEUR.**—You send no name and address. Read our rules.

**W. G. G.**—We are unable to decipher your address. Please send on addressed envelope, and we will write you.

**E. A. WUNSCH.**—At present we can give you no particulars. Send up a special query upon the subject.

**B. A.**—The slides are classed in the *Photographic Reporter* for this month. We cannot at present criticise the slides. Your letter was not stamped.

**E. F. BROCHER.**—Slides duly to hand; if they are successful the result will be published in the *AMATEUR PHOTOGRAPHER* and the classing of them in the April number of the *Photographic Reporter*.

**SPEN GLAZIER.**—There are several good makes of shutters advertised that will come within your price. We make a rule not to name apparatus.

**J. T. BIRKBECK.**—Many thanks for photographs. Shall we return them?

**C. H. OXFORD.**—See "Our Views" upon the subject.

**J. KIDSON TAYLOR.**—The photographs will be returned in due course, except those that are reproduced.

**A NORTH-WALLAN.**—You give no name and address, so we do not answer your question.

**W. CLEMENT WILLIAMS.**—Thanks for your long letter. Will write you later on.

**CAB. PHOTO.**—(1) All right. (2) Yes. (3) Yes. (4) Better use an I.R. lens. (5) Useful for both, preferably the former. (6) Look up maker's catalogues, and you will find answers to queries 7, 8, 9, 10, 11, and 12.

**SIGMA.**—Both lenses are excellent. We prefer shutter No. 3.

**F. MORLEY.**—(1) Our publishers will be pleased to forward you the February issue of the *Reporter*; your portrait appears in the March issue. (2) Very good value for the money. (3) The latter.

**C. E. F.**—No name and address, consequently we do not answer question.

**DUBLIN.**—October 30th.

**M. M. CUNEO (Portugal).**—Very pleased for you to become a competitor, and forward entry form.

**HUASCAR.**—(1) We have not seen the (a) 1891 hand-camera you mention, therefore can pass no opinion upon its merits; (b) is an excellent apparatus. (2) Answer already given, applies to (c) lens; (d) will do good work. (3) Cannot answer such a question.

**R. S. TRFILLIAN.**—The judges had full control over the awards, and we decline to discuss the why or wherefore of their withholding them. Yes, in the book "Holidays with the Camera."

## Quarterly Examinations in Photography.

### QUESTIONS.

- Copy p. vi. of this week's *AMATEUR PHOTOGRAPHER* one-third the size. Give full information as to your method of procedure, and forward a bromide or matt-surface print from the negative\* with your statement. (Wet plates must not be used.)
- Write a brief note on Heliochromy. (350 words allowed.)
- It is desired to obtain a relief cast of a seal. The seal has been photographed and you are in possession of the negative; how would you obtain a cast from it?

(Latest Day for Answers—March 16th.)

\* The negative must be preserved, as it will be required again, and will finally have to be forwarded to the examiners.

### RULES.

1. Answers must be received on the morning of the Monday week following the publication of the question.

2. All answers must be preceded by the question, and should be written on one side of the paper only.

3. A *nom de plume* may be used, but in every case the full name and address must also be given.

4. Answers must not exceed 250 words, unless otherwise stated by the examiners.

5. Those desirous of competing must apply to have their names entered, as these examinations are intended to encourage the study of the theory and practice of photography. Authorities upon photographic matters and contributors to the photographic journals will not be allowed to compete.

Marks will be given for all answers, and when possible, the three best answers will be published. Three prizes will be awarded at the end of each quarter.

All communications to be addressed:—  
"EXAMINATION DEPARTMENT,"  
AMATEUR PHOTOGRAPHER,  
1, CREED LANE,  
LONDON, E.C.

## Sale and Exchange.

**RULES.**—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

**REPORTING UPON APPARATUS.**—The Editor of the *AMATEUR PHOTOGRAPHER* will be pleased to report, to any intending purchaser, upon apparatus, etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the seller to him to the offices of the *AMATEUR PHOTOGRAPHER*, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending BUYER to pay a fee equivalent to a commission of 2½ per cent., the minimum fee being 2s. 6d., upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the SELLER. As far as possible, the Editor will undertake to send a report within TWO DAYS of receipt of goods.

### DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

Advertisements can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 3d. to cover postage.

**N.B.**—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

"*Amateur Photographer*," etc.—*AMATEUR PHOTOGRAPHER*, vols. x., xi., xii.; "Journal Almanacs," 1890, 1891; "Reporter," September, 1890; what offers?—Jones, 93, Senegal Road, South Bermondsey.

*AMATEUR PHOTOGRAPHER*, No. 1 to date, 334 numbers, eight or nine soiled, one or two indexes lost; what offers?—Southey, Audenshaw, Manchester.

THE photographic exhibition promoted by the Liverpool Amateur Photographic Association was opened with much ceremony, which is described at considerable length in another column, on Friday evening last. The initial opening ceremony was a conversazione, at which there were certainly not less than 3,000 people present. We have now for nearly twelve months kept the plans and movements of the Exhibition Committee before our readers, and it affords us unbounded satisfaction to be able to record that their exertions, so ably led by the President of the Association, Mr. Paul Lange, and carried out by Mr. Thomas Mayne, the Hon. Secretary, have resulted in a photographic exhibition upon which there can be but one verdict, *i.e.*, that all things have been done well, and that Liverpool holds the proud position of having in the rooms of the Walker Art Gallery the largest and best arranged exhibition of photographs that has ever been gathered together in this country.

Many of our readers will remember how high were the encomiums we passed upon the 1888 Liverpool Exhibition, but it is admitted on all sides that 1891 is better. There

are more pictures, and they have, none of them, except in the champion and "not for competition" classes, been exhibited before. Prizes have been awarded liberally by the judges: Captain Abney, Messrs. Pringle, Gibson, Webster, Robinson, and Gale; but we think the public verdict will support the awards in almost every case.

On the next page we give a portrait group of the judges, with Mr. Mayne, Mr. Tomkinson, and Mr. Stanistreet. For this picture we are indebted to Mr. Thompson, of Messrs. Robinson and Thompson, photographers of Liverpool and Birkenhead. We had hoped to have given a view of the Fountain-room, but time would not permit. We may add that the print was handed to Messrs. Waterlow and Sons, at 12.30 on Monday, and the block was in our hands on Wednesday soon after twelve. We mention this as showing how quickly photographs can now be reproduced.

We shall, of course, give a detailed account of the photographs, and the "first notice" appears this week, together with a plan of the rooms, which are so admirably adapted for the exhibition of photographs. There is a very considerable assortment of photographic apparatus, which will also be referred to at length. The principal exhibits are those of Messrs. Atkinson, Hume, Archer, Sharp and Hitchmough, Fry and Co., Wood, Miller, etc.

The special lantern exhibitions, two of which will be given every evening, will form a great attraction, and the enormous number of season tickets that have been sold is a very positive proof of how popular the exhibition will be amongst certainly the inhabitants of Liverpool and district.

On Friday night many men well known in photographic circles were present, and to our own knowledge the following cities were represented: Newcastle, Tynemouth, Hexham, Birmingham, Manchester, Glasgow, Shrewsbury, Chester, Dublin, and, of course, London. We believe representatives were present from every photographic journal, certainly three prominent editors and one sub-editor were *en évidence*. The honours of the Press were divided by Mr. Traill Taylor, of the *Journal*, and Mr. Charles W. Hastings, of the AMATEUR PHOTOGRAPHER, both gentlemen being called upon to speak in connection with the opening ceremony.

The most unique feature of the Exhibition is to be found in Mr. Ralph Robinson's "Artists at Home" series, which include the portraits of thirty-four R.A.s and A.R.A.s. These are "not for competition," but in our opinion form the finest collection of portraits photography has ever produced. We are glad to find that Mr. Robinson intends to publish them in three parts, containing twenty portraits in each part, all direct platinotype prints, published at £3 3s.

each part. In a very few years time the series will be priceless.

Much information regarding the Exhibition will be found in another column, and it only remains for us to recommend all our readers who can to pay an early visit to the Liverpool Photographic Exhibition.

OWING to the heavy calls upon our space, we are compelled to hold over our illustration, the "Seven Ages of Man," which will appear next week.

THE AMATEUR PHOTOGRAPHER 1890 Prize Slides are still earning golden opinions. We are pleased to be able to

Church Architecture," and on the 23rd inst. the annual general meeting will be held, followed at 8:30 p.m. by an exhibition of lantern-slides by Mr. Fitz Payne, Mr. Stevens, and other members.

So far as at present arranged, the following gentlemen will read papers at the Club Conference, which opens on Tuesday, April 7th, at 2 p.m.:—Captain Abney, Sir H. Trueman Wood, Mr. Joseph Pennell, Mr. C. V. Boys, Major J. F. Nott, and Mr. Lyonel Clark.

WE have had an opportunity during the last few days of talking to two members of the Executive of the Glasgow and West of Scotland Amateur Photographic Association, and hearing from them how energetically Glasgow men are

T. S. MAYNE. A. F. STANISTREET. CAPT. ABNEY. J. P. GIBSON.  
J. GALE. G. W. WEESTER.  
H. P. ROBINSON. ANDREW PRINGLE.

WILLIAM TOMKINSON.

#### JUDGES, LIVERPOOL EXHIBITION.

(BY MESSRS. ROBINSON AND THOMPSON.)

state that the few slides which were broken, owing to gross carelessness by *some person or persons unknown*, have, through the kindness of prize-winners, been replaced. Those secretaries of societies who may not have been fortunate enough to secure them, or private individuals, who may wish to have them for exhibition purposes, can now make application, giving three alternative dates after the middle of April.

WE are pleased to note that the Camera Club are now resuming active work. The first "Thursday Evening" will be on the 19th inst., when the Rev. T. Perkins, M.A., will give an illustrated lecture on "Further Notes on

taking up the exhibition; within a few days a handsome guarantee fund was raised, and although the exhibition is not to be held till September many promises of support have been received. It is the intention of the promoters to have a special branch for photo-mechanical work, for which purpose one of the members of the Executive Committee has come to London, and has interviewed all the large firms—we believe, with capital results.

OUR readers will remember that we promised an AMATEUR PHOTOGRAPHER'S *Annual*; we are glad to say that *the "Annual"* will be ready for delivery on the 16th inst. We trust it may be found a useful addition to the photographic

library; at least, we have copied no "Annual" that has been published, and we are quite confident of one thing, and that is, that the AMATEUR PHOTOGRAPHER'S "Annual" does not contain a single line that will not be of service to workers in photography, whether professional or amateur. With a promise of even a more useful "Annual" in 1892, we wait the verdict on our maiden effort.

—♦♦♦—

THE *Photographic Quarterly* for April will be well up to the preceding numbers, and will contain:—Frontispiece, "The Love Letter," by John E. Austin, which, it will be remembered, gained him a medal at the last Pall Mall Exhibition. Probable articles:—"Round Europe" (illustrated), by Cyril S. Cobb; "Teachings of a Chemical Actinometer," by Charles A. Koho, Ph.D., B.Sc.; "Papyrotint Process for Lithographing in Half-tones," by Captain A. M. Mantell, R.E.; "Toning of Images," by Clement J. Leaper, F.C.S.; "Idealism," by Fred. Davies; "The Relationship between Absorption and Sensitiveness of Sensitised Plates" (illustrated), by J. J. Ackworth, Ph.D., F.I.C.; "Memory and Imagination" (illustrated), by H. Ernest Murchison; and "The Camera's Service to Art," by J. Stanley Little, author of "What is Art?" "Art, Nature, and Photography," etc., etc.

—♦♦♦—

THE friends of Mr. Alfred Parsons, whose sketches have been so often admired in the pages of *Harper's Magazine*, rallied in force at the private view, on Saturday, of his paintings. Many artists were present, including Mr. David Murray, A.R.A., Mr. Marcus Stone, R.A., Miss Ada Bell (who, if the ladies had their rights, would add R.A. to her name), Mr. Mortimer Menpes, whose study of Japanese art is so extensive, and Mr. Alfred East, whose paintings excited so much interest recently. With Mr. George Du Maurier, the celebrated *Punch* artist, came his daughters, who are no strangers to diligent students of the pages of the "London Charivari." Mr. Geo. Meredith, who admires the scenes which Mr. Parsons depicts with all the love of a connoisseur of "gardens and orchards;" Mr. Hern, who has a name and fame in colonial art circles; and Sir Spencer Wells were also present.

—♦♦♦—

MR. MELHUISE has shown us the original drawings and specifications of the roll-holder which he invented and patented in 1855, for use with waxed paper. It is most ingenious, and Mr. Melhuish charged the holder with sufficient paper for twenty 20 by 16 negatives, and exposed them at Windsor Castle by special request, and in the presence of the late Prince Consort. The holder was a success in its time, and was used, amongst others, by Mr. Glaisher and Mr. Frank Hayes. The drawings can be seen at our office on Monday afternoon next.

—♦♦♦—

NOTE.—The very heavy calls upon our time and space have decided us to abstain *entirely* from advising as to purchase of apparatus, plates, paper, or photographic materials, which are now of so uniformly excellent a character that workers in photography can with every confidence place their orders with the many excellent firms who now cater for their wants. This will enable our editorial staff to devote far more time to advising upon questions of photographic procedure, criticising negatives and prints, whilst special attention and advice will be given upon the application of the rules of art to photography.

## PHOTOGRAPHY IN COLOURS.

THE interesting experiments of M. Lippmann as to the production of natural colours in photography, in which he has called in to his aid the phenomena of the interference of light, will naturally call attention to the subject. The interference of light was first discovered by Newton, who explained the phenomena of the colour of thin films, such as that of a film of air enclosed between two glass plates, or of the film of a soap bubble, or of a thin film of oil on the surface of water. We do not propose to enter into any scientific explanation as to the interference of light. Speaking briefly and in plain language, the colours of thin films are caused by the reflections from the inner surface of the film "interfering" with or extinguishing one or other of the coloured rays of the light reflected from the outer surface of the film, and therefore at this point we see the hue or colour tint which is formed by the union of the remaining coloured rays; this is, of course, supposing that the illumination is heterogeneous white light. If, on the other hand, we use a homogeneous or monochromatic light as the illuminant, we get alternate coloured and black bands, as, there being but one coloured light, the rays of light from the inner surface can only "interfere" with or extinguish the same coloured rays from the outer surface, hence we get no light or black bands.

The various phenomena to which interference of light gives rise are (1) the colours of thin films or popularly so-called Newton's Rings, (2) diffraction, with its exquisite phenomena of gorgeous colouring, including the so-called diffraction spectrum obtained by means of a grating, (3) the coloured fringes due to interference in the polarization of light. To those of our readers desirous of following up this subject more closely, reference must be made to the more advanced work of Young, Fresnel, Tyndall, etc. Nature frequently makes use of the phenomena of interference for the production of some of her most gorgeous colour effects; thus we find the interference of light producing the colours on certain feathers, as on a peacock's tail, the colours of mother of pearl; and the most brilliant and sparkling of all nature's living jewels, the humming-bird, owes its brilliant hues to the same effect, which are, perhaps, only rivalled by the beauty of some small beetles. The iridescence of many metallic substances is due to the same cause; and the finest of all gems, so far as regards colour, the opal, which bears such a bad name, gains its colours from interference.

The transition from the opal to opalescent media is but natural, and although it has been disputed that many of the effects we are about to discuss are due to interference, it is now generally accepted that such is the case; the subject being fully discussed theoretically by Brücke in Pozen-dorff's "Annalen," and Bezold in his well-known work, "Farbenlehre," to which our readers must refer. All states of matter, liquid, solid, and gaseous, exhibit this phenomenon. Thus, to take an example which may occur in landscape work, a column of thin smoke from a chimney will appear bluish as long as it is against a dark background, such as some trees, but as soon as it rises so as to show against a white cloud or bright sky, it becomes brownish yellow. Another instance, for indoor workers: an old oil painting frequently appears, especially in any dark-brown shadows or parts, as though covered with a blue haze or mist; this is due to innumerable cracks in the varnish. The remedy for this, or that usually employed by the photographer, is the use of an absorbent media, such as a yellow screen, which absorbs the blue reflected light, which extinguishes the detail. The picture restorer places his picture face downwards over hot alcohol, and thus fills up the cracks by swelling of the

particles of pigment and varnish consequent on absorption of the vapour of the alcohol. Another natural effect ascribed to the same cause is that of sunset and other effects of lighting. Our atmosphere is filled with innumerable fine particles of matter which never settle down and which are never removed by rain; these fine particles reflect blue light, but the light which passes through them is yellowish, and Brücke gives the following experiment to prove this. He dissolved one part of gum mastic in eighty-seven parts of spirit, and then added this solution gradually to water which was being vigorously stirred. The water when looked at or through, appears white; that is to say, unless of very great depth, the light is transmitted and reflected unchanged in colour. Now let us stir the water vigorously and add a drop or two of our mastic solution, and immediately the reflected light has a pale-bluish tinge, the transmitted light is a very pale lemon yellow; we add a little more resin solution, and the colours become deeper and deeper with every addition, till finally the yellow of the transmitted light becomes orange, then red, and, finally, no light is transmitted at all. Now we have only to consider our atmosphere as the vessel of water; we already have the suspended particles of matter answering to the resin; all that we want to do is to increase the number of particles. This we cannot do, but we may so change the direction or path of the ray of light that it shall pass through a greater thickness of air, and consequently meet with a greater number of particles, and as the position of the sun at midday is, we will assume, fairly upright above us, it stands to reason that the air thickness for the light to travel through is not so great as when very low down on the horizon; therefore we find our pale-blue light gradually becoming a pale lemon, then a full yellow, then orange, then orange red, and red. Surely, now we should get darkness? Not quite, though we still get the effect of mixing the deep blue reflected light of space with the transmitted red light, and the result is purple, and as the red fades more and more, the shades become more purplish blue, till finally we get a bluish grey or deep blue, according to whether the moon shows its light or not. The action of clouds upon this changing play of lights we have not considered, and all the changes may not be quite so regular or even as we have pointed out, but the above are the principal tints to be observed in a sunset. Let us turn again to the landscape and trace the effect of suspended air particles and suspended aqueous vapour with regard to our photographic retina or sensitive film. We all of us know that every object in the landscape reflects certain coloured light to the lens, and as the objects recede further and further from the lens, there is an ever-increasing thickness of air and suspended particles which reflect more and more bluish light, which mingles with that reflected from the objects themselves, modifying the effect of their particular colours, and modifying the result on the sensitive film. Let us take a range of distant mountains; the layers of suspended particles will reflect considerable bluish light, and this light entirely overpowers or extinguishes the actual reflected light from the objects on the mountain, so that our mountains are considerably more exposed than near objects, the dominant colours of which are not altered by any light from suspended particles. As the bluish reflected light is very near in tint to the pure sky tint, it is a great deal more actinic than the actual or real coloured light from the mountains, hence the contrast of light and shade is reduced, whilst in near objects the light and shade remains distinct and sharply defined, and hence we get our distance over-exposed and our foreground under-exposed, unless we are careful to so regulate exposure and development to give harmonious and truthful effects,

which shall be more nearly allied to those we see with our eyes, which are not so sensitive to the blue rays as the sensitive film.

M. Lippmann has relied on suspended particles, as it were, to give him his colours, and it is obvious that to obtain certain colours at will, he must be able to so determine the thickness and deposition of his particles as to interfere with or extinguish all rays but the one he wants; by no means an easy task, and this is the point where will lie the great difficulty in practical application of his process. The statement that when viewed by transmitted light, the results are so-called negative, that is, show complementary colours, is easily understood from our notes above, as, if the particles of silver reflect one particular coloured ray, the light that is transmitted must obviously be the complementary colours. Another difficulty which M. Lippmann has met with is the formation of an emulsion so fine that no "grain" shall be visible under the microscope. Now Brücke found that in his experiment with alcoholic solution of mastic and water, the suspended particles were sometimes so fine as to evade detection by the most powerful microscopes, and remained suspended in the water for months and months. We have here a hint as to the formation of an emulsion suitable for his experiment; why not make a somewhat thin solution of bromised albumen or gelatine, stir it vigorously, and drop into it either a very dilute alcoholic solution of nitrate of silver, or a dilute aqueous solution of the same salt? From a few experiments we have made in this direction, this method of procedure will give as fine an emulsion as is possible to obtain—far finer than anything ever yet produced commercially.

It is rather a curious coincidence that it is just about a year since we had an announcement of the discovery of photography in natural colours by M. Veresz, a Hungarian, and also a year since Captain Abney's oracular statement that photography in natural colours, either by a printing-out or development process, was an utter impossibility, which statement appeared in the *Daily Graphic* of March 22nd, 1890, and was also repeated at the British Association for the Advancement of Science and the Camera Club Conference.

## Letters to the Editor.

### A TRAVELLING PORTFOLIO CLUB.

SIR,—When I was a learner of Pitman's phonography I was prone to encourage an institution known as the Ever-circulating Magazine. The contributors consisted of a conductor and ten or fifteen members, whose names and addresses were inscribed on the first page, who received the magazine by post, retained it for three days, inserted an article, made remarks on certain blank pages provided for the purpose, and sent the little journal on its way. In a month or six weeks, the magazine, having returned to the conductor, was again sent round, and each member on its arrival removed his former article and replaced it by another.

Through this medium I saw many different kind of phonography—good, bad, and indifferent—the former stimulating me to higher achievements, and the latter teaching me what to avoid.

Is there such a thing in the photographic world, and if not, could not the idea be copied with advantage? The manner of adapting the ever-circular principle to photography is simple, and a circle of, say, twenty earnest workers, all striving to excel, could not fail to produce a valuable magazine. Perhaps you will consider this suggestion worthy of prominence in the pages of the *AMATEUR PHOTOGRAPHER*.—Yours faithfully, WM. BAIRD.

Rathdowney, Ireland,  
March 4th, 1891.

(There are already a number of postal photographic clubs on these lines in existence.—ED. AM : PHOT.)

## "PHOTOGRAPHIC REPORTER."

SIR,—I must congratulate you on the very successful reproduction of my photograph "The Last Load," which appears in the current number of the *Reporter*. Considering that it is from a negative copied from a print, I think it is all that can be desired. One or two of my friends who have seen it have expressed the opinion that it is one of the best reproductions which have appeared.

## HAND-CAMERA WITH SWING FRONT.

Referring to a short paragraph which appeared in last week's *AMATEUR PHOTOGRAPHER*, expressing a want for a hand-camera with a swing front, I may mention that I have designed some time ago the very thing your correspondent calls for. Ordinary hand-cameras on the market can only be put to a very limited use, as anyone desiring rather to produce one or two *pictures* in a year than expose so many hundred plates, very soon finds out.

I have just completed provisional protection for patent, and am arranging to place cameras on the market in about one month's time.

My camera can be used for any lenses, from about 3½ in. to 8 in. Has every movement which an ordinary camera has, at the same time it can be used on stand, in the hand, or for daylight enlarging.—Yours faithfully,

ALG. BROOKER.

March 8th, 1891.

\* \* \* \*

## PHOTOGRAPHY IN COLOURS.

SIR,—I have at last seen, with great pleasure, the realisation of the theory I have held for some time, in the results produced by M. Lippmann, in reference to colour photography. It may not be out of place to mention that I and my brother have been for some time experimenting in this line, and have tried in most respects the same procedure as M. Lippmann's, with the exception that we used a dry-plate film backed in optical contact with a mercury mirror, and obtained no satisfactory result. I hope soon to be able to give you any results which may accrue from our experiments. I am about to try the substitution of metal plates (in the form of burnished silvered copper plates) instead of glass, as I wish to test the intensity, etc., of electric disturbance produced by the action of light, and also by a process of electrolysis (which I hope to describe later on) to so depose the coloured layers of silver on this metallic plate, that the result would be a coloured image, built up almost entirely of metal, and therefore permanent; so in these respects glass would not answer. There is no doubt that the use of a metal plate to obtain a coloured (positive) image direct, will be eventually found to be the most satisfactory from which duplicates could be obtained by a process of transfer on glass or otherwise. Going back to the early days of photography, viz., daguerreotypes, no one can fail to see, after a critical examination of one of these productions, a suspicion of colour, unless he be colour-blind. In a case described a few months back in the *AMATEUR PHOTOGRAPHER* where a gentleman obtained a vivid photograph in true colours, on a daguerreotype plate; having made the exposure to the subject during an intense flash of lightning, I think this was undoubtedly due to the intensity of light acting on the dull silver plate, thus bringing about the same effect as if it were a bright mercury mirror with a weaker light, and so "interference" was set up, as in M. Lippmann's process. In ordinary daguerreotypes, taken under normal conditions, I think this suspicion of colour is partly due to the silvered metal plate and also to the bichloride of mercury used in the intensification of the image; both these tending in a minor degree to set up "interference" of the wave-lengths of light as described by M. Lippmann. I hope soon to obtain some tangible results from experiments based on the electro-magnetic theory of light (proposed and proved by Maxwell) which I venture to think is the key to colour photography. It is easy to understand now how the colours are produced by M. Lippmann's process, and as far as I glean, the colours, as yet, can only be reproduced through coloured media (as glass) or from the solar spectrum, where the colours are received in a dark-room; but I doubt whether we shall by this process be able to take colours from nature, where we have the interference of actinic light between the coloured object and camera; the two cases also being different in that, in nature, coloured objects are so by reflection and not transmission; in other words, an opaque coloured object is such that it absorbs all the solar rays, except that which it reflects by its molecular composition, and which we call its colour. Therefore to produce

these colours satisfactorily, we must have a means of cutting off all rays, actinic or otherwise, which come between the object and sensitive plate. At first sight this would appear an insuperable difficulty, but I venture to suggest that it could be brought about by the aid of a *black* polarising mirror (as used in photographing clouds), so that, in fact, we should photograph the image as reflected by this mirror; or else we should have to photograph the object through coloured (transparent) screens, agreeing in colour to those of the solar spectrum; the exposure being proportional, through each colour, to the actinism of that colour; so that when the object had been photographed through each consecutive colour (on the same plate) beginning with the lowest on the scale in actinism, the plate would have had the correct exposure. I hope all enthusiastic amateurs will help in any way by combining to throw more light (I should say colour) on this most interesting subject, and, by publishing their results from experiments in this direction, so help to bring about practically, as an accomplished fact, "photography in natural colours," and thus raise art to the highest standard attainable.—I am, Sir, yours faithfully,

D. G. GORDON.

16, Weighton Road, Anerley, S.E.

SIR,—I notice an *a priori* objection to "photography in colours," signed G. Lacy.

Granted that colour is "purely subjective," still whatever the qualities of certain surfaces may be which excite the impression of colour in our sense of sight, there is not, and there cannot be, any *a priori* impossibility in those qualities being so far imitated on other surfaces as to produce similar impressions on the senses. Suppose that the surface of a gelatine plate can be made somehow to reflect the same rays to our eyes which coloured objects in nature reflect, clearly the thing is done. A person will see the one just as he sees the other; if his sight is normal he will see both natural objects and their representation as coloured; if he is colour-blind he will still see them alike, though, for aught I know, red and green may appear to him as slightly different shades of brown.

Mr. Leigh's argument, if it would hold good, would equally prove the impossibility of all painting.

F. W. STOW.

Aysgarth Vicarage.

\* \* \* \*

## STEREO MOUNTS.

SIR,—The paper stereographs entered by me, and which were awarded second prize in the late competition, have been alluded to on several occasions in your columns; one report very flatteringly asserting that "if they had been transparencies they would have been perfection;" the fact being that these card slides were purposely entered, to see what chloride paper could do against glass in a public competition; the result confirming my opinion that Obernetter and Aristotype paper, glass dried, are nearly, if not quite, as effective as transparencies.

In answer to the query of the Hon. Secretary, Stockton, the cut-out card mounts were supplied by Way, Victoria Parade, Torquay. Everything, of course, depends upon the exact distance between centres, a difficulty I have found insurmountable with London dealers. If there is any merit in these slides it must lie in these mounts, which are themselves rendered stereoscopic by the simple process (found out for myself, but no doubt well known to the old stereographers) of arranging the twin prints a shade wider than the apertures.

Mentone, March 8th.

LEIGH PHILLIPPS (Major.)

**Zeiss Microscopic Catalogue.**—We have received from Mr. Harthank, of 174, Charing Cross Road, a catalogue of microscopes and microscopic apparatus manufactured by Carl Zeiss, the well-known optician of Jena, and we should strongly advise all our readers who are working, or intend to work photo-micrography, to apply for one of the English catalogues, which will be ready shortly. The one before us is in German, and may be considered as not only a catalogue but a text-book on the special articles for which Herr Zeiss is so famous. We have here an explanation of the special apochromatic objectives and the principles on which they are constructed. The projection eye-pieces are treated in the same way, and tables are given showing the magnifying powers it is possible to attain with certain objectives and eye-pieces. The special apparatus for testing micro-objectives, stands, tables, condensers, etc., are also included, and a very complete and instructive explanation of the apparatus for photo-micrography, with the usual smaller requirements of microscopists.

## Composition, and Light and Shade.

*Selected and arranged for the use of Photographers, from "Burnet's Essays," with Introduction and Notes.*

By H. P. ROBINSON.

### CHAPTER VI.

Fig. 11. The plan of composition I have here taken up is in the form of a diamond; which we find often adopted, either as a complete group, or as forming part of a more complicated arrangement. In commencing a composition, I have mentioned, "that it is of importance to mark in those points most necessary to our purpose." For example, when a story is to be told, the heads and hands, the seats of action and expression, are often referred to each other for the completion of form or extension of light; as by such means the eye of the spectator is led to the commencement and operation of the incident. After arranging the principal points, what are called "the secondary" require the greatest consideration; whether for the repetition of the lines, extension of the form, or conduct of the light and shade. Sometimes we are actuated by our requiring a second or third group for the better illustration of the story, which naturally leads us in the direction that affords us the greatest space; sometimes by the principal group demanding a considerable portion of the ground for a mass of shadow, beyond which a strong point is required, as a link of communication between the figures and the background. By making this point the strongest of a secondary group of objects, either from its size, lights, or darks, the eye is carried into the most remote circumstances, which become a

FIG. 11.

part of the whole, from the principal group being made to depend upon such point for the completion of its form, the extension of the light, or the repetition of colour.

Fig. 12. — In designs constructed upon this plan (especially of the Dutch School), we generally find the lower part of the form strongly pronounced, either by colour, or by light upon a dark ground, or vice versa: this gives the group a firm foundation, and also enables the artist to

FIG. 12.—A OSTADE.

keep the other objects in their proper situations as to distance from the eye. I wish particularly to direct the student's attention to this particular, as a doctrine, founded upon the rays of vision, has been attempted to be established, viz., that objects as they recede from the centre of the picture, either to the sides or bottom, ought to be deprived of part of their force of light and shade and colour.

This is neither nature nor art. If the subject requires those objects to be kept subordinate, true art does not deprive them of their natural force, by robbing them of their lights, darks, or colours; it renders them less obtrusive by the ground which surrounds them, or substitutes other objects of a less attractive quality.

Fig. 13.—By making the circumstance from which the story springs a strong point (either from situation, force, or colour), and surrounding it with those objects more immediately connected and most illustrative of its effects, the picture explains itself at a glance; which is one of the strong distinctions of painting from poetry,—the one proceeding in a circuitous route to hide the denouement and keep hold of the attention, the other proclaiming instantaneously the beginning and end of the story. I do not mean that the circumstance ought always to occupy the centre, any more than that the hero should always occupy the centre; but, as it is of use to explain the cause of his action and expression, it has, in my mind, a prior claim to consideration.

It has been said that emphasis is impossible in a photograph. If this were true, photography could have little claim as one of the fine arts. It would mean that the photographer had no control whatever over his subject. This misleading statement is refuted every time a figure is placed, with knowledge, in a landscape for the purpose of strengthening a point or emphasising a situation. One method of emphasising a point, or, in other words, giving the key-note to the picture, both as regards the masses and light and shade, is to add a figure or figures that shall have

points of darker dark and lighter light than can be found in other parts. This emphasis will often produce interest by the subject, harmony by collecting scattered lights and lines to a focus, and atmosphere by giving a measure of highest and lowest tones, also by contrast, and all this to a scene that was otherwise flat and common-place.

Fig. 11 deals with the points that should be more or less prominent in a group. A knowledge of the principle—which is only another of the many ways to securing variety—may also be of use in the composition of a single figure, as applied to the points of interest given by the hands, head, etc.

Figs 12 and 13 are sufficiently explained by the text, and are examples of subjects which may be successfully attempted by the photographer.

Burnet often trenches on what some think are modern discoveries, and others denounce as modern heresies, but which are as old as the hills. I wish particularly to call attention to his remarks on fig. 12, in which he incidentally alludes to, and strongly condemns, something very like what is now called impressionism. I agree with, and have always endeavoured to enforce, his striking opinion that "this is neither nature nor art."

(To be continued.)

FIG. 13.—BURNET.

## Photo-Micrography.—VI.

BY ANDREW PRINGLE.

SINCE writing Chapter V. I have seen what appears to me a most extraordinary account of a discussion on the use of the ocular, the discussion being held at a technical meeting of the Photographic Society of Great Britain. The speakers seemed to be unaware that—I put it boldly—all the best work of the present day is done with the projection ocular. I cannot name a single worker really accepted as being in the van of photo-micrography who does not use the ocular. Mr. Nelson, Mr. Comber, Mr. Smith, Mr. Curties, Dr. Bousfield, Dr. H. van Heurck, Dr. R. Zeiss, Dr. Pfeiffer—all these use it, I believe, always over the lowest power work. (I do not know how the matter stands in America, where there are good workers.) The use of the projection ocular is not only a very great convenience, but a very great advance towards the best results. I would not dream of working without a proper ocular, provided my required magnification was over, say, 20 diameters. But fairly good work can be done without the ocular, provided the objective is thoroughly corrected for photography, up to, say, 500 diameters with a one-twelfth, or a little more with a one-twentieth. But the same magnification will be decidedly better obtained with a one-eighth or one-twelfth, and a low-power projection ocular. For low-power work up to, say, 100 diameters and with easy objects, good results can be got without the ocular, but again, I believe better results will be got with a proper ocular and a proper objective.

### EXPOSURE.

It is not uncommon to see in books and in papers tables given to help the worker to judge of the exposure required. If I could compile or find a table which would be of any real use at all, I would gladly give it here. Everything depends on everything else. Exposure increases directly as diameters of magnification, and that is about the only law that can be laid down to be of any use. Exposure decreases as aperture increases, but we never, or very rarely, are in a position to measure the aperture we are using.

A plan which I found very useful may be recommended here. The first desideratum (in order of practice) to be attended to is the obtaining of a white background in the positive, *i.e.*, a dense black ground in the negative. Sometimes this cannot be got, but at all events we should, in nearly all cases, try to get it. So one of my earliest works was to find and to tabulate the minimum exposure necessary with a given light, a given condenser at a given aperture, and with a given objective without ocular, in order to get a dense black negative background on a given plate with no object in the stage, or else with a pure black and white object as a mounted diatom. It took me some hours, but I managed to tabulate a table of this sort for each of the objectives I then possessed. Here then I had my minimum exposure at a certain magnification; if I increased or diminished magnification, I knew still the minimum exposure; for in practice it will be found that it does not matter by what means we alter our magnification, by change of camera-stretch or by eye-piecing, the exposure always follows the magnification.

Now I surely need not tell any photographer that alteration of light, of plate, of colour or density of object entails alteration of exposure. If I could give a table of all these, then I could and would give a table for exposure. I trust myself, and I strongly urge my readers to trust, not to any

table, but to a careful scrutiny of what happens to the plate during the process of development. When we come to that, I shall very carefully describe the appearances under development when error of exposure has been made; by this method I hope and believe the reader will learn, and quickly, to regulate exposures for himself. After a very large amount of practice, and with fair knowledge of all the stains commonly used in such work as that which I deal with, I do not often make a serious mistake in exposure; but confront me with some new stain or some abnormally treated preparation, and I have to judge by development just as I desire my most unpractised reader to do. An ingenious method of arriving approximately at the required exposure for any colourless object may be found in a little book by Dr. E. C. Bousfield (*"Guide to Photo-Micrography,"* W. Kent and Co., London). Dr. Bousfield determines the force of the light at the plane of the sensitive plate, by means of the figured screen of a Warnerke sensitometer, which he examines while held in that plane. He determines first the highest number on the screen which he can plainly make out, and then, assuming the plate-sensitiveness to be known, he calculates the necessary exposure, and he puts his calculations in the form of a table which forms part of his book. Still, nothing like an accurate allowance for colour can be made by this method, and I again urge the worker to learn exposure by exposing.

Something must be said about the plates to be used. I venture to distinguish between two classes of subjects which require to a certain extent distinct treatment: (1) Subjects with strong contrasts of density, colour, thickness. In this class we find a large number of subjects usually treated with low powers—coarse diatoms, insects, pathological and physiological sections not very thinly cut. (2) Subjects wanting in photographic contrast, such as very fine diatoms, very thin sections, parasites, and low forms of life unstained or highly stained and mounted in clear solutions or gums, faded stains of all kinds. For subjects presenting strong contrasts, either of density or actinicness, the proper kind of plate is undoubtedly one not prone to great density, one of considerable sensitiveness, for the exposure is sometimes protracted, one giving plenty of gradation, for the danger with such subjects is want of gradation. A good plate of the kind used in portraiture may be trusted to meet these requirements. For the pale, pellucid, washed-out or very thin subject, we require a plate by no means very "rapid," with power of yielding great density, with plenty of emulsion on the glass and plenty of silver in the emulsion. A so-called "landscape" plate, thickly coated if possible, or even a good "lantern" plate will be found the "best plate" for this class of work.

But the photo-micrographer who means business may at once take to "colour-correct" plates, or "orthochromatic," or "isochromatic;" he may very easily treat plates for himself, or he may buy his plates ready colour-sensitised. I must say that the colour-sensitiveness in commercial plates, so far as I have experienced, is not carried to any very high point, still their comparative sensitiveness to yellow is quite noticeable, and their qualities in this direction can be eked out by the judicious use of yellow and other screens. I may say that I use more of the isochromatic plates than of all others put together, yet I seldom use them without a yellow screen, and I sometimes use four and even five or six screens. I am quite prepared to admit, as a writer on this subject has said, that colour-correct plates and screens are not primarily intended to help us to contrast; at the same time they often are the only means by which we can get contrast, and there is therefore good reason for us to use them. Neither black and white objects, nor objects *well* stained with red, yellow, blue, violet, or indeed any good stain, require either colour-

NOTE.—Mr. Pringle has kindly consented to answer any questions on photo-micrography. Letters should be addressed care of Editor.

correct plates or screens, but when we have to deal with multiple stains, or poor stains, or faded stains, then we do well to take to colour-corrected plates and, if necessary, screens.

There is nothing mysterious or terrible in the operation of colour-correcting plates for ordinary purposes. I think nothing of treating several dozens of quarter-plates during any spare hour or two. With half-a-dozen quarter-plate dishes a great many plates can be done in an hour. I use any moderately slow gelatine-bromide plate of commerce, Thomas' landscape, Wratten's "green label," etc. Make a solution, 1 part to 1,000 of distilled water, of "Erythrosin B," of the *Badische Anilin und Soda-Fabrik*. See that you get the proper article, which is *not fluorescent* in solution. Make also a dilution of liquor ammoniæ 1 part, water *dist.* 9 parts. Bathe each plate about two minutes in—

Erythrosin (1 to 1,000 as above)	..	1 part.
Ammonia (10 per cent. as above)	..	1 "
Water, <i>dist.</i>	.. .. .	8 "

Do not wash after this, but dry in total darkness. Yellow light in the dark-room is not admissible. This treatment will increase the *general* sensitiveness of the plate nearly three times. The ammonia may be omitted, in which case the relative sensitiveness to yellow will be relatively increased, but the general sensitiveness will be several (four or five) times decreased. Cyanin used exactly as the erythrosin will considerably increase sensitiveness to red, but it is very awkward to work with on that very account, and in my experience the general quality of the plate is damaged; but for subjects wholly or in large proportion red, this system is of great value. Plates treated with ammoniacal erythrosin ought to keep for a week, with plain erythrosin for many weeks, with ammoniacal cyanin not many days; of cyanin alone I have little experience, as I only use cyanin *pro re nata*.

When we come to consider special treatment of special subjects, I shall have more to say about orthochromatic matters.

(To be continued.)

## Chemistry for Photographers.

By C. H. BOTHAMLEY, F.I.C., F.C.S.

(Continued from page 153.)

AMMONIUM neutralises acids and forms the compounds known as the *ammonium salts*.

EXPERIMENT 107.—Dilute 25 c.c. of strong ammonia solution with four times as much water, and gradually add dilute hydrochloric acid, with constant stirring, until the liquid just reddens blue litmus paper. Concentrate by evaporation, and allow to crystallise. The product is *ammonium chloride*,  $\text{NH}_4\text{Cl}$  ( $\text{NH}_3 + \text{HCl} = \text{NH}_4\text{Cl}$ ); dry it on filter paper. Observe that it closely resembles common salt (sodium chloride) in appearance, and has a very similar taste. Dissolve some in water and test for a chloride as in Expt. 72, and for ammonia by heating with caustic soda as in Expt. 101.

EXPERIMENT 108.—Neutralise a similar quantity of ammonia in a similar manner with dilute nitric acid, concentrate and allow to crystallise; the product is *ammonium nitrate*,  $\text{NH}_4\text{NO}_3$  ( $\text{NH}_3 + \text{HNO}_3 = \text{NH}_4\text{NO}_3$ ). Observe that it resembles potassium nitrate (Expts. 74 and 77) in appearance; test it for ammonia.

The relation between the ammonium salts and those of potassium and sodium is shown by the following formulæ:—

	Chloride.	Bromide.	Nitrate	Sulphate.
Sodium	$\text{NaCl}$	$\text{NaBr}$	$\text{NaNO}_3$	$\text{Na}_2\text{SO}_4$
Potassium	$\text{KCl}$	$\text{KBr}$	$\text{KNO}_3$	$\text{K}_2\text{SO}_4$
Ammonium	$\text{NH}_4\text{Cl}$	$\text{NH}_4\text{Br}$	$\text{NH}_4\text{NO}_3$	$(\text{NH}_4)_2\text{SO}_4$

The group  $\text{NH}_4$  behaves like the single elements potassium and sodium, and replaces the basic hydrogen of the acids, forming salts. This group is called *ammonium*; it is a *compound radicle*, i.e., a group of elements that behaves like a single element, and can be transferred entire from one compound to another, like the potassium and the silver in Expt. 81.

EXPERIMENT 109.—To a solution of 5 grammes of ammonium bromide add a solution of 8.5 grammes of silver nitrate, filter off the precipitate of silver bromide and concentrate the filtrate by evaporation. Ammonium nitrate will crystallise out, identical in appearance and properties with that formed in Experiment 108; test it for ammonia. The equation representing the reaction is  $\text{NH}_4\text{Br} + \text{AgNO}_3 = \text{NH}_4\text{NO}_3 + \text{AgBr}$ .

Ammonium has not been isolated in the free state, but it occurs in so many compounds that it is often represented by the special symbol Am; thus,  $\text{AmBr}$ ,  $\text{AmNO}_3$ ,  $\text{Am}_2\text{SO}_4$ , instead of  $\text{NH}_4\text{Br}$ ,  $\text{NH}_4\text{NO}_3$ ,  $(\text{NH}_4)_2\text{SO}_4$ .

Ammonia also give rise to another important series of compounds, some of which are frequently met with. They are called *metallic ammoniacal derivatives*, or, sometimes, *ammonio compounds*.

EXPERIMENT 110.—To some silver nitrate solution add dilute ammonia solution drop by drop, until the brown precipitate which forms is just redissolved. The liquid now contains *ammonio-silver nitrate*  $\text{AgNO}_3 \cdot 2\text{NH}_3$ , which can be obtained in crystals if the solution is allowed to evaporate spontaneously at the ordinary temperature.

EXPERIMENT 111.—To some silver nitrate solution add some hydrochloric acid, allow the precipitate of silver chloride to settle, and pour off the clear liquid. Now add some dilute ammonia to the precipitate; it will dissolve, and the solution contains *ammonio-silver chloride*,  $2\text{AgCl} \cdot 3\text{NH}_3$ , which can likewise be obtained in crystals.

EXPERIMENT 112.—To a solution of copper sulphate add dilute ammonia solution drop by drop; a bluish-white precipitate forms, but afterwards dissolves in excess of the ammonia, forming a deep blue solution of *ammonio-cupric sulphate*,  $\text{CuSO}_4 \cdot 4\text{NH}_3$ .

Note carefully that these ammonia compounds are quite distinct from the ammonium compounds. They will be referred to again under the different metals.

*Hydrazine* or *Amidogen*,  $\text{N}_2\text{H}_4$ , is a gas with a smell somewhat like that of ammonia, is very soluble in water, and has a strong alkaline reaction, neutralising acids and forming a special series of salts.

*Hydrazoic acid*  $\text{N}_3\text{H}$  is also a gas, soluble in water, and is liable to decompose explosively; it has acidic properties. Both these compounds can only be obtained by special and difficult reactions.

### COMPOUNDS OF NITROGEN WITH OXYGEN AND HYDROGEN.

Nitrogen and oxygen form five distinct compounds; nitrogen, oxygen, and hydrogen form three compounds, all of which are acids.

*Nitric Acid*,  $\text{HNO}_3$ , is the most important of them all, and from it the other seven compounds can be prepared. It can be made on a small scale by gently heating potassium nitrate with an equal weight of strong sulphuric acid in a retort arranged as in fig. 23. Nitric acid distils over and collects in the receiver, the heating being stopped when the retort begins to be filled with orange-brown fumes. The reaction is  $\text{KNO}_3 + \text{H}_2\text{SO}_4 = \text{HNO}_3 + \text{KHSO}_4$ . On a large scale the acid is made in iron retorts from sodium nitrate and sulphuric acid, the reaction being

$2\text{NaNO}_3 + \text{H}_2\text{SO}_4 = 2\text{HNO}_3 + \text{Na}_2\text{SO}_4$ . In an iron vessel the materials can be heated to a higher temperature than is practicable in a glass vessel, and one molecule of sulphuric acid will decompose two molecules of the nitrate.

Nitric acid, when quite pure, is a colourless fuming liquid, which rapidly absorbs moisture from the atmosphere. It boils at 86 degs. C, but when heated or when exposed to light it partially decomposes into nitrogen peroxide ( $\text{NO}_2$ ), water and oxygen, thus  $2\text{HNO}_3 = 2\text{NO}_2 + \text{O} + \text{H}_2\text{O}$ . Part of the peroxide remains dissolved in the acid, and gives it an orange-yellow colour. The tendency to decompose in this way decreases when the acid is diluted with water, and a mixture of 68 parts by weight of real  $\text{HNO}_3$ , and 32 parts by weight of water, boils without change of composition at  $120.5^\circ$  under the ordinary atmospheric pressure. The mixture has a specific gravity of 1.42 at the ordinary temperature. When strong nitric acid is mixed with water, there is considerable development of heat.

Nitric acid is highly corrosive, producing very painful wounds if it falls upon the skin, and it rapidly attacks and oxidises many forms of organic matter. If the strongest acid is dropped upon dry straw, etc., so much heat is liberated by the chemical action that the straw takes fire. Weaker acid still acts energetically, staining the skin and other organic matter, yellow or orange, and oxidising them.

The efficiency of the nitric acid as an oxidising agent depends on the fact that it contains a very large proportion of oxygen (48 parts out of 63) in a somewhat loose form of combination. Upon some compounds nitric acid exerts a *nitrating* and not an oxidising action, hydrogen being removed from the substance and converted into water, whilst the group  $\text{NO}_2$  takes its place and forms a *nitro*-compound. Benzene,  $\text{C}_6\text{H}_6$ , for example, yields *nitro-benzene*,  $\text{C}_6\text{H}_5\text{NO}_2$ , thus  $\text{C}_6\text{H}_6 + \text{HNO}_3 = \text{C}_6\text{H}_5\text{NO}_2 + \text{H}_2\text{O}$ . Only strong nitric acid acts as a nitrating agent.

Nitric acid attacks all metals except gold and the metals of the platinum group, converting them, as a rule, into nitrates, though in a few cases, *e.g.*, tin and antimony, the action of the strong acid yields an oxide and not a nitrate.

EXPERIMENT 113.—To some pieces of tin add some strong nitric acid; energetic action takes place, orange-brown vapours of nitrogen peroxide,  $\text{NO}_2$ , are evolved, and a white residue of hydrated tin oxide,  $\text{SnO}_2$ , remains. The reaction is  $4\text{HNO}_3 + \text{Sn} = 4\text{NO}_2 + \text{SnO}_2 + 2\text{H}_2\text{O}$ .

EXPERIMENT 114.—Pour on some copper some strong nitric acid previously diluted with an equal quantity of water; energetic action takes place, nitrogen peroxide is again formed, and a blue solution of copper nitrate  $\text{Cu}(\text{NO}_3)_2$  is obtained. Pour off the liquid from any undissolved copper and allow it to cool; if no crystals separate, concentrate the liquid.\* Copper nitrate will separate in blue needle shaped crystals.

EXPERIMENT 115.—Perform a similar experiment with some silver, and crystallise the silver nitrate  $\text{AgNO}_3$  that is formed.

The relation of the nitrates to nitric acid will be made clear by the following formulæ—

We are informed that the partnership between Messrs. Fry and Hayman has been dissolved. Mr. Fry will carry on the business on his own account. No change will be made in the style of the firm.

\* The concentration must be done in the open air or under a chimney if no proper draught cupboard is available, since the vapours of nitric acid are highly corrosive and injurious.

## The Illustrated Novel of the Future.

By CHARLES E. PEARCE.

MR. CARMICHAEL THOMAS, in his recent lecture at the Society of Arts, stimulated curiosity. He alluded to the latest American "method" of illustrating a story. It consists of the substitution of the photographer for the artist. The manuscript, we are told, is placed in the hands of the photographer, who selects suitable persons to represent the author's ideas, and photographs them as nearly as he can in the pose and with the surroundings described in the text. At least, this is the theory. Thanks to the enterprise of the proprietors of the *Cosmopolitan*, a New York illustrated monthly magazine, copies of which have been sent to this country, an opportunity presents itself of judging how far theory is borne out in practice.

The story is of the "intense" school, and the first illustration, taken in conjunction with the descriptive matter, suggests possibilities which under certain circumstances are likely to cause a sensitive sitter some embarrassment. We have given to us the portrait of a young man of fairly regular features and of pleasing expression, but in no way remarkable. The portrait is discovered in a sale room by the heroine, aged eighteen, with a heart "steeped in sorrow, as an opal's fire is clouded with pearly mist." A damsel so peculiarly constituted would naturally see more in a photograph of a young man than would the average common-place person. Accordingly, the face possessed her "by its show of virile strength. Eyebrows, eyes, nose, mouth, through each of these features ran a sense of dominating force, firm as a bar of iron." We are further told that "the purpose in the clear eyes and chiselled lips halted just this side of defiance. A Roman youth of the imperial body-guard who had given himself to Christ with the impassioned fidelity of those early days might have looked like that, as the gaunt lion sprang towards him." This almost takes away one's breath, and a mental collapse is imminent, when we read that "as the nostrils of the war-horse dilate to the scent of battle, the clear-cut mouth seemed quivering on the verge of a smile."

A marvellous face indeed! There was an infinite deal in Lord Burleigh's nod, but it cannot compare with what the damsel of the sorrow-steeped heart found in the youth with the expression of a bar of iron. What a thrill of pleasure must have gone through the sitter when he read the glowing words! How he must have rushed to the mirror to gaze upon his dilating nostrils and quivering mouth! But further surprises are in store for him. The gentleman who posed for the hero has unmistakably short legs. The next photograph shows this beyond the probable, possible shadow of doubt. But no one who has short legs likes to think they are short, and the sitter will try to believe that the photographer was wrong, and the author right, when he wrote, "His long legs were stretched out before him." In this photograph the reader is made aware that the photographer has his own notions about the story as well as the author. While the latter says of the youth with the dilating nostrils, that "his hands were thrust in his trousers' pockets and his square sinewy shoulders were pressed against the back of the chair," the former insists that he should have his hands clasped behind his head. Thus has he been photographed, and in this pose he gazes upon a picture, compared with which Fuseli's nightmare creations based upon suppers of pork chops, must sink into nothingness.

"A sheet of steely water," we read, "stabbed with dark shadows stole back and gnawed the edge of a ghastly tongue

of land in the middle distance. There was an unutterable loneliness about it, as of a dead earth, and the livid stretch ashen, with purplish lines, seemed stricken with the touch of a slow decomposition." After this it is not surprising to read that "Norman Thorne looked upon the baleful thing that his hand had made unflinchingly till the grim sullenness of it made him heave a quick sigh. The slight extra strain thus brought to bear on the already over-strained back of his weak chair was the one straw too much. Without prelusive crackle or yielding, it snapped squarely off. . . . He sprang up at once, and towered above the wreck of his chair with quick annoyance flashing from his eyes. A vicious kick sent the shattered thing out of his way, and with his hands thrust in his pockets again he glowered at the remains."

We respectfully submit that here the photographer has missed a great opportunity. A glowering young gentleman with dilating nostrils towering above the wreck of a chair, and kicking it viciously, would surely have made an effective picture, besides bringing instantaneous photography into play. But no. The photographer with annoying perversity elects to put the glowering youth into a good, sturdy, ponderous, studio piece of furniture, with a back that would stand any amount of sighing. As for kicking, the result would be about the same as in the celebrated kicking match when the cow went for the pump under the impression it was a member of its family.

The rift within the lute opens wider as the story proceeds. The young lady of the sorrow-steeped heart is walking in Central Park, where the artist of the chair-breaking sigh is sketching and the wind blows off her hat. The author, regardless of the photographer's feelings, writes of the artist, "He used his long legs to run very swiftly." But he is too late, the hat is blown into the lake, and the young hero plunges after it. This leads to the most remarkable photograph of the series. Here we have the artist, with his legs shorter than ever (the photographer scores splendidly this time), supposed to be dripping with water, and dripping in a way which only the engraver can explain. We certainly trust the photographer is innocent. The drops of water are palpable scratches on the metal block, and very badly done too. Only one coat sleeve is dripping; the other is as dry as a bone, while the gentleman's continuations, which the author says "clung to his legs tightly," are in a normal state of bagginess. Surely this is not what the naturalistic school has led us to expect. We have a right to demand that the sitter should have dipped himself in the photographer's tank before posing. The discovery that the new style is not above resorting to dodges saddens us. We hardly care to note that in the same picture the damsel of eighteen is, from the photographer's point of view, a matronly and rather dumpy person of at least thirty.

It really would appear that in stories illustrated by photographs from life, principles which used to be considered essential are of no consequence. The old-fashioned notion of author and artist entering into the spirit of each other's work is all moonshine if the last picture illustrating the story can be justified. Underneath the photograph are the words, "It was I who bought your portrait," the picture showing the hero with a sickly smile on his quivering lips, holding the matronly lady of eighteen in his arms, the two being posed as if about to dance the polka. Yet the text says, "He knelt before her, his fingers clasping hers, his gaze bent eagerly upon her. She raised her head slowly with the searching love light in her eyes, put forth her hand upon his forehead, and brushing back the thick hair, said softly, with smiling lips, 'You foolish boy! It was I who bought your portrait.'"

After this we give up. The union of photographer and novelist may be a very desirable thing, but at least the two ought to make up their minds to agree upon all important points. Most readers are indulgent, still they may be irritated beyond endurance, and when they are perpetually getting "mixed" between text and pictures, the book by a "vicious kick" may find its fate in the fire.

#### THE PRINCESS OF WALES AND PHOTOGRAPHY.

KING MIDAS turned everything which he touched into gold. That was in Phrygia and in the days when Pan and Apollo engaged in a musical contest. Nowadays the royal touch makes fashionable that which it favours.

We have chronicled in these columns the names of those personages of high degree who have fallen in love with photography. The last instance of such a conquest is shown in the case of H.R.H. the Princess of Wales. But, as becomes the native wit of the Princess, Her Royal Highness has turned her thoughts towards a new scheme for utilising amateur productions of the camera. In the summer, with H.R.H. the Princesses Victoria and Maud, both of whom are expert photographers, she succeeded in taking a series of admirable views in Scotland. Most of the landscapes included portraits of some of the royal circle. These negatives the Princess has placed in the hands of Messrs. John Mortlock and Co., the well-known manufacturers of china, for the purpose of illuminating a tea service for Her Royal Highness.

On the highest authority we are able to give particulars of this tea service, which will doubtless set the fashion for other examples of amateur photographers' work. For the purposes of fitly emphasising this new scheme for recalling at "five o'clock tea," the scenes which the Princess chose for photography, Messrs. Mortlock have designed an entirely fresh shape for the tea-cups in the service, which will be of white china. On the sides of the tea-cups will be transferred, as well as on the saucers, prints from the negatives. There will, in all probability, be sixty-three distinct pieces in the tea service. The colour in which the views will be printed will, it is expected, approximate to the tint favoured by Bartolozzi. The whole service will be original in style, both as to shape and as to its decoration by photography. The execution of this work by Messrs. Mortlock is gratifying on other grounds beyond the tribute again paid by Royalty to the excellence of the taste of that firm. It will lead the way towards another artistic, and at the same time interesting, use for the productions of amateur photography. Although, probably, conversation rarely fails at afternoon tea-time, yet the sight of charming spots where pleasant hours have been spent by their photographers cannot fail to lend additional piquancy to the hour sacred to Saint Bohea.

#### Photo-mechanical Prints with an Ordinary Copying Press.—

Herr A. V. Lavroff, the editor of *Amateur Photographen*, our Russian contemporary, thus describes his method for obtaining a cliché from which it is possible to obtain several hundred impressions in an ordinary copying press:—"On a thick sheet of glass I obtain a cliché by means of bichromated gelatine, which, after developing, I leave to dry at the ordinary temperature for twenty-four hours, after which I flood it with the following 'bain mouilleur':—

Water	...	...	...	...	...	100 cc.m.
Glycerine	...	...	...	...	...	200 cc.m.
Hyposulphite	...	...	...	...	...	2 grammes.

This is allowed to act from one to two hours, according to the desired relief. Then I remove the liquid from the glass by means of a very soft pad and blotting paper, and then I ink up the cliché by means of a gelatine roller. The first pull or two are generally poor and are somewhat spoilt by the dampness of the cliché, but the subsequent impressions are excellent. In order to print in the copying press, I lay the inked clichés on a piece of india-rubber cloth, a mask of paraffin paper, and then the paper on which I wish to have the impression, and over this a thin bag of fine cloth filled with wadding. It is the use of this blanket which makes it possible to press the paper into contact, and to obtain all the fineness and details of the cliché. Of all the formulæ I have tried for the 'bain mouilleur,' I have found the above the best, as well for the relief as for the number of impressions. If after about twenty pulls the details of the high lights begin to show gray, one only need damp the cliché with a pad dipped in the same liquid, in order to make it as good as ever."

## Notes for Novices.

### THE DIAPHRAGM (*continued*).

THE influence of the diaphragm as regards the size of it is important, for, as we have already seen, the exposure varies according to the size of the diaphragm aperture, or rather, according to the square of its diameter. The influence of the size of the diaphragm aperture upon the illumination of the plate is very great. When we use a large aperture diaphragm the illumination is brilliant, and as we insert smaller and smaller diaphragms it gets flatter and flatter; therefore, it is always advisable to use as large a diaphragm as possible. Depth of focus is a theoretical impossibility, but an actual fact, and the smaller the diaphragm the greater the depth of focus, or, in other words, the smaller the diaphragm the more objects on different planes or at different distances from the camera we can get in focus.

For focussing it is always advisable to choose one object, about the middle distance in a landscape, or else a figure, or the most prominent object in the view. Focus this as sharply as possible with full aperture of the lens, then insert the next size diaphragm and again look at the focus screen. If the rest of the view is not quite so sharp as you may desire, then insert the next size diaphragm till you have got everything as sharp as you want it, then cap your lens and expose.

There are one or two little fallacies with regard to the diaphragm which it is advisable to note. The first is that using a small diaphragm increases the covering power of the lens. Well, a diaphragm, however small, does no such thing. We often see the statement made that a certain lens, made for half-plate say, will with a small diaphragm cover a whole-plate. Well, so the lens would cover the whole-plate without the diaphragm. What the insertion of a smaller diaphragm does is merely to increase the area of sharp definition, a totally different thing. This is easily proved by fixing a quarter-plate lens to 12 by 10 camera, and so arranging the camera that the image of the sky is thrown on to the focussing screen; we shall then find that the diameter of the circle of light is about 6 in., the diameter of the area of sharp definition is about 5 in., if the lens has a very flat field, or  $3\frac{1}{2}$  to 4 in. if the field of the lens is curved. Now, on inserting a very small diaphragm, the diameter of the circle of sharp definition is increased to the full limit of the illuminated circle. Another fallacy is that when a stop is inserted the object previously focussed on requires refocussing. Now this is obviously untrue, as the action of the diaphragm does not alter the length of the focus except for the rays of light near the margin.

One method of using the diaphragms which has been very often recommended, is to focus with full aperture and then always insert a given sized diaphragm—for instance,  $f/32$ —it being claimed for this method that by this means a beginner more readily begins to understand the “*pons asinorum*” of exposure, and can easily mentally refer back to the appearance of any view on the ground-glass of which he obtained a good negative, and thus judge as to the relative exposures of different views. Another plan, proposed, we believe, by Captain Abney, is to focus with a certain aperture, say  $f/11$ , and then always to insert the one half that size, viz,  $f/22$ . The objection we have to both these plans is that neither is calculated to be suitable to every subject, and that some view—for instance, a landscape with some trees rather near on a dull windy day—will require an exposure as short as possible, so as to avoid blurring from movement of the boughs and leaves of a tree; and, again, it may be necessary and, indeed, is often advisable, when focussing a landscape with figures to obtain the figure sharply defined and the several planes of the landscape less distinct, and this can only be done by the use of fairly large apertured diaphragms. Therefore, never tie yourselves to one general aperture; use your common sense and judgment, and you will thus obtain far better and more artistic results.

Our next note will be on Choice of a Plate for general out-door work and also for special work.

**New Etching**—A very happy reproduction of the celebrated picture by Metz, entitled “The Cello Player,” has been just published by the Fine Art Society. Mr. Macbeth Raeburn, who has etched with excellent success and skill this interesting picture, is to be heartily congratulated on both his subject and his work.

## Exhibitions

### LIVERPOOL INTERNATIONAL PHOTOGRAPHIES.

#### No. I.

(By Our Special Correspondent.)

#### FROM OVERTURE TO FINALE.

At a fashionable gathering of 3,000 “evening-dressed” ladies and gentlemen, the curtain was at length, on Friday, 6th March, rung up on the long-anticipated, much-discussed Liverpool International Photographic Exhibition of 1891. Musical accompaniments, superb management, and the presence of some of the finest photographic talent in the world—the latter represented by masters of photography in person, and by highest class photographic work—assisted to give the show a send-off at once inspiring and imposing. Galleries in admittedly the finest art exhibition building in the three kingdoms (see plan) are allotted to the over 4,000 pictures comprising this latest photographic collection, and as the critic picks his way among the animated groups of people which line the galleries, the fact is

forced upon him that he must come to review the display on another and quieter day. It is a wonderful collection and selection, this exhibition—as significant of the extraordinary advance of photography universally as it is eloquent of the vitality, vigour, and enthusiasm of those who have borne it to such splendid success.

Upwards of 1,500 frames, including 4,200 or 4,300 different pictures, contributed by the very best workers in photography from all parts of Great Britain and Ireland, America, Australia, India, Italy, Germany, Russia, France, and other countries, make up an exhibition quite unequalled in the past annals of the photographic art.

The Liverpool Photographic Exhibition of 1888, excellent as it was, is quite eclipsed by this of 1891. Three years have wrought marvellous improvement. Comparing the two exhibitions, it is found that the number of exhibits has largely increased, they are much more representative, and they show a marked advance in quality. And this progress is not more remarkable for its rapidity than for its generality and consistency. In all departments and in all processes there have been distinct steps forward. Whatever possibilities there are for photography in the future, the work in the Liverpool 1891 Photographies marks an epoch.

One of the most striking evidences of the worth and importance of the exhibition is manifested in the number of photographic experts, amateur, professional, and journalistic, present at the complimentary dinner given to the adjudicators an hour or two prior to the opening ceremony. Representatives of England, Ireland, Scotland, and Wales were unanimous in their praise of the work sent in, its classification, and, in fact, of all the details connected with the show. “It is a *unique* exhibition,” said one of the post-prandial speakers; and perhaps a better and more expressive term cannot be applied to it. Mr. Paul Lange, the Pre-

sident, and Mr. T. S. Mayne, the Secretary, seemed to be particularly well pleased with his concise designation, as were the remaining gentlemen of the executive.

As will readily be believed, the dinner to the judges, Messrs. J. Gale, H. P. Robinson, A. Pringle, J. Pattison Gibson, G. Watmough Webster, and Captain Abney, was a great success. Nearly forty gentlemen were present; the cuisine was excellent, the "flow of soul" exhilarating, and the speeches admirable.

Among the speakers to the several toasts were Messrs. Paul Lange, H. P. Robinson, J. Gale, J. P. Gibson, G. Watmough Webster, H. Moore, A.R.A., C. W. Hastings, T. S. Mayne, and T. Taylor.

Several prominent Liverpool gentlemen, including Mr. Philip H. Rathbone, the foremost of local authorities in art matters, were also present and assisted at the repast.

#### THE OPENING CONVERSAZIONE.

Towards eight o'clock a move was made to the Walker Art Gallery. Rain was falling for the first time in Liverpool for many days, but the unpropitious change affected the opening attendance little if at all. A long file of carriages discharged their freights at the foot of the Walker Gallery steps for upwards of an hour, the guests being ushered to the exhibition rooms amid the strains of an unusually excellent brass and string band. Liverpool's permanent collection of art treasures in the same building was also thrown open, which in some degree, later on in the evening, thinned the over-crowded photographic galleries. Animation, bustle, and gaiety ruled supreme. The fine display of exhibits, tastefully arranged and picturesquely surmounted by decorations in a delicate shade of blue and old gold, were an effective background to the streams of daintily dressed ladies, and gentlemen in "claw-hammer" coats, who passed and repassed before them. Scattered here and there were chatting groups of many of the most widely-known men in photography—judges, exhibitors, officials, and representatives from leading centres in filial converse. Hurrying from one gallery to another, busily attending to the comfort of the vast assembly, were the officers and the stewards, easily distinguishable by the red and white, or blue and white favours in their button-holes. Look where one would, from the refreshment saloons to the street door, there was a chance for an interesting snap-shot at every step.

At about nine o'clock the formal speech-making was commenced, Mr. Lange being supported on the platform by Mr. Philip H. Rathbone and Mr. E. R. Russell, Editor of the *Liverpool Daily Post*.

The President extended a cordial welcome to the visitors, and Mr. Rathbone then declared the Exhibition open. He said that they had around them the results of a comparatively unknown artist—the sun. For many years the sun had done great work in agriculture and other departments, but it was only recently that he had turned his attention to art. Yet none could gainsay that at the present time he was one of the greatest artists they had.

Mr. E. R. Russell, in the name of the people of Liverpool, welcomed all photographers from a distance, and expressed an earnest hope for the prosperity of the Exhibition. Mr. Traill Taylor and Mr. Charles W. Hastings followed. The latter gentleman's remarks, he being the only representative of the photographic Press present at the Liverpool Exhibition of 1888, had especial interest. Mr. Hastings said—"I am extremely pleased to be called upon to say a few words this evening. I had the very distinguished honour of being the only representative of the photographic Press here in 1888. This Exhibition is the outcome of that promoted by the Liverpool Amateur Photographic Association. I believe I am right in saying that amongst all the 200 photographic associations, Liverpool has done the best work in the past, and there is every prospect of their doing the best work in the future, for they have most excellent workers to support them. You have heard Mr. Taylor speak of the names of Sayce and Bolton. Mr. Sayce has done work in photography for many years, and I congratulate him heartily on the progress made, and on the wonderful developments which he has produced. We have before us here a compliment to photography by one of the most accomplished workers—Mr. Ralph Robinson. It is a compliment to photography to know that artists have thought fit and proper to sit to a photographer in their own homes. It is not probable that this collection will ever be surpassed. There is another matter I should like to mention. We have a gentleman present

to-night who is known all over the world—Mr. H. Moore, A.R.A. We, as amateur photographers, have the honour of ranking him by our side. He is a photographer of forty years' standing, and is not above acknowledging that photography has done good service to art. I will call upon him to say a few words." Mr. Moore and Mr. G. Watmough Webster spoke in felicitous terms, and then Mr. T. S. Mayne and Mr. Paul Lange, both of whom were received with rapturous applause, concluded the formal proceedings in a few well chosen words.

#### AWARDS.

Nearly fifty awards were made. These included three gold medals, eighteen silver, and twenty-three bronze. The list is:—

Class.	Medal.	
1. Portraits .. ..	Silver ..	Withdrawn.
2. " .. ..	Bronze ..	Harold Baker.
3. " .. ..	" ..	Window and Grove.
4. " .. ..	" ..	W. J. Byrne.
5. Landscape .. ..	" ..	E. Lloyd Edwards.
5. " .. ..	" ..	F. D'Arces.
6. " .. ..	Silver ..	Wm. Tomkinson.
7. No award, medal withheld.		
8. Landscapes .. ..	Bronze ..	Thos. Zacharias.
9. No award, medal withheld.		
10. Marine and Cloud Studies	Silver ..	S. Bourne.
10. " .. ..	Bronze ..	Thos. Glazebrook.
11. Animals .. ..	Silver ..	Chas. Reid.
12. Groups (Outdoor) ..	" ..	F. M. Sutcliffe.
12. " .. ..	Bronze ..	F. Bremner.
13. Architectural .. ..	" ..	C. Court Cole.
14. Architectural (8 by 5) ..	" ..	G. E. Thompson.
15. Scientific .. ..	Silver ..	R. Paulussen.
15. " .. ..	Bronze ..	Cecil V. Shadbolt.
15. Flashlight Pictures ..	Gold ..	Countess Loredana de Porto Bonin.
16. Genre .. ..	Silver ..	Shapoor N. Bhedwar.
17. Enlargement .. ..	Bronze ..	Chas. W. Huson.
18. Stereoscopic .. ..	Silver ..	H. J. Houghton.
19. Lantern Slides .. ..	" ..	G. E. Thompson.
19. " .. ..	Bronze ..	John Carpenter.
19. " .. ..	" ..	F. Anyon.
20. " .. ..	" ..	W. L. Howie.
21. " .. ..	Silver ..	Priestley and Sons.
21. " .. ..	Bronze ..	J. W. Wade.
21. " .. ..	" ..	F. Anyon.
22. Hand-Camera Work ..	Silver ..	John White.
23. " .. ..	Bronze ..	A. G. Bristow.
23. " .. ..	" ..	J. M. Nicholson.
24. " .. ..	" ..	W. D. Welford.
25. Instantaneous .. ..	Silver ..	Karl Greger.
25A. General Section .. ..	" ..	H. McMichael.
25A. " .. ..	" ..	W. J. Byrne.
25A. " .. ..	" ..	A. Vandyke.
26. Ladies' Work .. ..	" ..	Miss Lil. W. Tomkinson.
26. " .. ..	Bronze ..	Mrs. Janie N. Hignett.
26. " .. ..	" ..	Mrs. S. F. Clarke.
27. Beginners .. ..	" ..	Vincent Fothergill.
— Champion .. ..	Gold ..	Shapoor N. Bhedwar.
— " .. ..	" ..	J. B. B. Wellington.
— General Collection .. ..	Silver ..	Chas. Scolik.
— " .. ..	" ..	R. S. Redfield.
— " .. ..	Gold ..	Ralph W. Robinson,

for his unique collection of eminent artists, together with his other work.

#### PROMINENT PICTURES OF THE SHOW.

Pictures which may be placed in this category are very numerous, the standard reached in most instances being surprisingly high. We intend to notice each in turn, but this week have only space to mention comparatively few. Lantern slides and apparatus are also held over for review until next week. The gold medallists, Countess Loredana de Porto Bonin, Shapoor N. Bhedwar, and Mr. Ralph W. Robinson, certainly deserve the highest recognition. The Italian countess's twelve flash-light pictures, 623 to 634, which won for her the golden distinction, are marvellously correct. She also has a genre study, 677, which is very high class, and five landscape studies, 319 to 322, and 401. This lady has a wonderful eye for artistic posing and effect, and

her studies are finished with the utmost conscientiousness and care. Shapoor N. Bhedwar has won the coveted honour with a lovely picture, 1,009, "The Feast of Roses," an exhibit in the Champion Class. Mr. Bhedwar is a worker who will take a stand with the best of the front-rank men. He also contributes a genre study, 645. Mr. Ralph Robinson exhibits a large number of pictures in various classes, nearly all of which have attracted special attention. His unique and valuable series of "Artists at Home" (well known in London) are, however, apparently the most popular. Mr. Charles Scolik, of Vienna, shows twelve platinotype costume studies, 903, really clever, amusing, and interesting; and Mr. Alfons von Mumm, Washington, U.S.A., also has some very capital pictures. Vandyke, 934 and 938, and Barraud's are professional firms with very excellent work in portraiture; Mr. H. McMichael, 61 to 64, shines in the same line, other good work being that of Mr. T. H. Flather, 53 to 56, Mr. George Latimer, 5 to 8, and Mr. Harold Baker, 65 to 68, the latter a bronze medal winner. Four pictures, 95 to 98, by Mr. W. J. Bryne, are clever and pleasing, as are 106 to 109 by the same worker. In Class V., 118 to 121, Dr. Reynolds, of London, shows four exceedingly creditable pictures taken in Iceland; Mr. E. Lloyd Edwards four studies, 142 to 145 (No. 143 the best); Mr. A. Hendry four studies, 174 to 177; Mr. William Bedford four studies, 210 to 213; Mr. T. M. Brownrigg four studies, 218 to 221; and Mr. S. G. Buchanan Wollaston, the courteous Secretary of the Crystal Palace Exhibition, four, 230 to 233, 233 being the pick of the set, which are hoar-frost studies. Other noticeable pictures in landscapes are 247, Mrs. Janie N. Hignett; 249, Sidney Snelgrove; 257, Mr. Henry Lupton; 262, Mr. W. P. Shaw; 268, Mr. William Tomkinson; 275, M. de Déchy; 289—290, J. Milman Brown; 354, Lamond Howie; 377, J. L. Mackrell. In Marine and Cloud Studies, Class X, Mr. Thomas Glazebrook exhibits four pictures, 407 to 410; Mr. Henry Rupert Marsden four, 419 to 422; Mr. Harry Symonds four, 424; Mr. S. Bourne four, 432 to 435, of which 435 is the cleverest; Mr. A. F. Stanistreet, 438; Mr. J. L. Mackrell, 468; and Mr. William Parry, 469 to 472. In Animal Studies Mr. Chas. Reid takes the silver medal with 485; Mr. F. M. Sutcliffe being equally successful with 503, of 503 to 506. Among the Outdoor Groups Mr. C. Court Cole and Mr. G. E. Thompson each take a medal in the Architectural Class, the former with 565, and the latter with 589. Both are very fine productions. Mr. Cecil V. Shadbolt's 583 is also very fine. In the General Section, Messrs. H. McMichael is particularly to the front with a series comprising two scenes from *Twelfth Night*, 859 to 860, and six studies, "Enoch Arden," 861 to 866. Mr. Fred Hollyer, with work of equal merit, comes in from 890 to 899. Miss Lil. W. Tomkinson takes the President's prize in the Ladies' Class with four pretty pictures, 955; Mrs. Janie N. Hignett, 946; and Miss Edith B. Wilson, 947, are also to be specially commended for their contributions. The Champion Class pictures, and many of those in the "Not for Competition" department, are of rare excellence. Messrs. Richard Keene, Lyd Sawyer, Marshall Wane, A. Schmitz, J. L. Mackrell, R. H. Lord, W. W. Winter, A. R. Dresser, Frank M. Sutcliffe, J. B. B. Wellington, J. P. Gibson, Louis Meldon, J. Moffat, H. P. Robinson, Paul Lange, J. Gale, etc., have each magnificent pictures hung. But of these, with others, together with notes of the lantern slides, etc., more anon.

## Notes from the Edinburgh Centre.

(By our District Editor.)

At the monthly meeting of the Edinburgh Photographic Society in Dowell's Rooms, George Street, on 4th inst., Mr. H. J. Blanc, the President, occupied the chair, and business went on much more speedily than at the previous monthly meeting, when much time was spent in preliminary wrangling. After seven members had been admitted—one lady and six gentlemen—the Chairman made an intimation that in future the technical part of the business would be taken first, and any other business afterwards. He then dwelt on the proposals with reference to the holding of out-door meetings during the summer, and the granting of medals for the best work of the season. He was sure, he said, that when they went out on Saturday afternoons, and met others with cameras, they frequently heard it regretted that in the Society opportunities were not afforded whereby they might go

as a community, and instruct themselves by interchange of experiences. Outdoor meetings used to exist as a part of the programme of the Society, and it had been thought that with so large a number flocking round the Society, it would be a very interesting and instructive part of their business to hold those meetings. They would be held on Saturday afternoons, and the Council hoped they would be able to bring together a number of good workers who should in the winter months following be able to lay before them the results of the gatherings. It was intended to offer medals, not altogether in connection with the outdoor meetings, but one medal would be given for the best work produced at one of the three summer meetings.

Dr. Wm. Stewart then read a paper on "Gelatio-Chloride Papers and their Manipulation." He made, he said, no pretensions to account for the chemical reactions, but would simply relate his own experience, and the results obtained. He was induced to take up the subject on account of his having been for some time resident in Switzerland. He claimed many advantages for these papers; they print more easily and efficiently, are simpler in their manipulations, and require less washing than ordinary prints. His experiments were chiefly directed towards the finishing of the print, and he showed that by drying the print on ground-glass it was possible to produce a print with a matt surface. Dr. Stewart handed round specimens of matt-surface prints, as well as of prints finished with the highest glaze and as ordinary silver prints. In the discussion which followed, Mr. W. T. Bashford, Portobello, referred to the delicate shades which could be produced by the paper, and, speaking of the difficulty of mounting, because of the water in the mountant destroying the gelatine, he told of the method by which a French photographer he once met overcame this, which was by mounting in a cut-out mount, and pasting the edges of the print to the front portion of the mount, leaving the body of the print altogether unattached to the back. Mr. J. M. Turnbull, Rose Street, pointed out that the paper went by the name of Ober-netter because a German manufacturer was the first to place it on the market, but that the discovery was in reality an English one. Dr. Stewart was thanked for his paper.

The photographic supper, to which I referred last week, was held in Daish's Rooms, in South St. Andrew-street, on the evening of Friday last, and was a great success, though not largely attended. In the absence of Mr. Blanc, who was in the country, Dr. Drinkwater occupied the chair, and was a host in himself. The toast of "The Edinburgh Photographic Society" was proposed by him in a few words, and was acknowledged by Mr. T. Barclay, the secretary of the society. Mr. J. R. Roddick, the assistant secretary of the Edinburgh Society, proposed "The Edinburgh Photographic Club," which, he said, contained the cream of Edinburgh photographers. Mr. John S. Smith acknowledged. Mr. James Crichton proposed "Kindred Societies," and, in replying, Mr. G. G. Mitchell said he often wished there was more interchange of ideas and socialities among photographic societies, and he suggested a conference of representatives, at which matters relating to photography might be talked over, and they would thus learn from one another. Mr. Charles Fraser, the croupier, proposed "The President, Vice-Presidents, and office-bearers of the Edinburgh Photographic Society," and recalled the distinguished men who had held office, and all of whom had worked ably for the benefit of photography. Mr. J. M. Turnbull acknowledged the toast. The Edinburgh Photographic Society, he said, certainly did not now stand forth as it used to do. There had been a great increase in the number of photographic societies—and the more the better—but previous to the great impulse which the gelatine plate gave to the art they all so much loved, the Edinburgh Society was the principal photographic society in the world, in the position it occupied, as well as in the able papers which were read before it and the number of members it had. Mr. Mitchell proposed "The Literature of Photography" in an interesting speech, coupling the toast with the name of your representative in this district, who did his best to acknowledge the honour paid to the AMATEUR PHOTOGRAPHER, as well as to himself, but did it, I fear, only very indifferently. A suggestion by Mr. Turnbull that the Photographic Convention should be invited to Edinburgh in 1892 was received with much favour. It was resolved to despatch a telegram to the Secretary of the Liverpool Photographic Society, conveying the greetings of the gathering and their best wishes for the success of the Liverpool Exhibition. The hour being late, the telegram was sent by Mr. Ayton on Saturday morning.

## Apparatus.

### THE "CLIMAX" HAND-CAMERA.

MESSRS. J. WATSON, of 34, Grainger Street, and G. Johnston, of 37, Warrington Road, Newcastle-on-Tyne, have invented and patented a new hand-camera, which they claim to be the simplest and most effective automatic changing hand-camera in use at present. The camera, which is constructed to carry eighteen or twenty-four plates, is very compact, the outside measurements being only 10 in. by  $4\frac{1}{2}$  in. by 4 in., and the changing is done by the simple pulling out and return of a brass rod by means of a small milled head in the front. The plates are in metal sheaths, and the apparatus is so arranged that no plate can be exposed twice in consequence of over-running the number stored. The camera is fitted with a fixed-focus doublet and a very quick shutter, working between the lenses, which is also the invention of Mr. Johnston. The lens works at  $f/10$ , and will easily cover a 5 by 4 plate. It was proposed to place a quarter-plate finder on the camera, with a lens of the same focus as the doublet; the exposure of the plate would not interfere with the view in the finder. The whole, loaded with eighteen plates, weighed only  $4\frac{1}{2}$  lbs. Although the model shown to us was, of course, somewhat incomplete, there appeared to be in it all the elements of future success.

### ROBERTS'S HAND-CAMERA.

MR. ROBERTS, of Leytonstone, has favoured us with a call to show us his improved hand-camera. It is made of black wood, and measures  $11\frac{1}{2}$  by  $5\frac{5}{8}$  by  $7\frac{3}{4}$  in., and weighs, when filled with plates, about 6 $\frac{1}{2}$  lb. It is arranged to take eighteen quarter-plates, which are stored in a grooved chamber at the top of the camera. When required to expose a plate, a little pin at the back is pulled out, and a plate is heard to drop down into focus. After exposure the camera is turned upside down, and the same little pin is again pulled out, and the plate is heard to drop back into its original groove; the pin is pushed home, the camera turned over, and a milled head at the side of the camera is released by a catch at the top, and is turned till the index shows another plate is ready to drop down into the exposure chamber. By having thus one magazine chamber considerable room is saved, and a convenient little door at the back enables one to focus on a sheet of ground-glass in the lower chamber with a certainty of not getting the plates fogged, and of having the plate exactly in register also. The front bearing the lens is attached to a little bellows, and the camera may thus be used in the ordinary way on a tripod, a screw and socket being provided for this purpose; the lens is also attached to a shifting front. The shutter is of the blind type, working in front of the lens. A sunk finder and level are also provided; underneath is a scale of distances for focussing for hand-work, the lens being moved by a small rack and pinion. The whole instrument is the outcome of a practical worker's effort to provide a boxed-in camera which could be used as a hand or ordinary camera with the advantages of a magazine attached, and, at the absurdly cheap price of £3 10s., this should find many friends amongst our readers. This price does not, of course, include a lens, but Mr. Roberts also supplies a rectilinear lens, of  $5\frac{1}{2}$  in. focus, working at  $f/6$  approx., at 25s extra, and we can certainly speak highly of its covering powers, as evinced by some specimens of work done by it last week at Torquay. Shorter or longer focus lenses can also be used with it.

**"Perfected Pensions."**—The Directors of the Church of England Assurance Institution felt that some method of securing an annual income in old age, instead of merely an endowment policy, was needed, and have formulated a scheme by which a man aged thirty, may, by an annual payment of £15 only, until the age of sixty-five, secure for himself an income thereafter of no less than £100 per annum; while should he unfortunately die before reaching that age, the whole of the premiums paid by him would be returned to his representatives. To secure these policies no medical examination is required, residence is allowed in all parts of the world, no extra premiums can become payable under any circumstances, the whole of the premiums paid are returned in the event of death before the attainment of pension age, the policies are unconditional from the commencement, and they are strictly non-forfeitable.

## Quarterly Examinations in Photography.

**Question 19.**—Describe the production of a transparency by the carbon process.

**ANSWER.**—A print is first taken from the negative on a piece of sensitised carbon tissue, a special quality of which, prepared for transparencies, can be obtained ready for use, consisting of paper coated with a solution of gelatine containing a coloured pigment, and sensitised by floating on a bath of bichromate of potash. The negative must be given a "safe edge" of black about a quarter of an inch wide to protect the edges of the tissue from the action of light. The operation of printing is the same as for an ordinary silver print, but its progress cannot be watched; an "actinometer" must be used to gauge the exposure. The glass which is to form the permanent support of the picture should be prepared by coating with a weak solution of gelatine containing a small quantity of alum and allowing to dry. The exposed tissue and the glass are then soaked in cold water until the former lies perfectly flat, when they are placed face to face, removed from the water, and squeezed together. The picture is then developed by placing the print attached to the glass into warm water (about 100 degs. F.), when in a short time the paper packing can be removed, and by gentle washing those portions of the film not acted upon by light are removed, leaving the picture formed by the gelatine on the glass. After rinsing in cold water, soaking for a short time in an alum solution, and again washing, it is allowed to dry, and is then ready for mounting.

WORFIELD.

**Question 20.**—What is the action of light upon a film of gelatine impregnated with bichromate of potash? And what is the action of the exposed film towards water and fatty ink?

**ANSWER.**—After exposure to light it is always found that a mixture of gelatine and bichromate of potash is rendered insoluble in water; but as to the exact chemical reaction, authorities differ to a very considerable extent. One eminent authority (Abney) asserts that the bichromate is reduced and chromic oxide formed. Another (Eder) states that a chromate of chromium is produced, and that the gelatine associated with this compound in the part insoluble in water after the exposure is not changed in its chemical composition, whilst a third (Burton) thinks that chromic acid is liberated.

As previously stated, the mixture is insoluble in water after exposure to light, and if a film of it be exposed under a negative, we shall have the various shades of the negative represented by different degrees of solubility; but if after exposure we simply soak it in cold water, we shall have the lights and shades represented by different degrees of relief, as those parts acted upon by light absorb water less freely, and so swell up to a less extent than the unaffected parts. If we now apply a fatty ink to the film, we shall find that it will only adhere to those parts which have been acted upon by light, and which have not absorbed water, and it will adhere to the parts exposed to light in nearly exact proportion to the intensity of the light that has acted upon it.

SUNESIS.

**Question 21.**—Is there any difference between photographing a landscape and a reproduction of the same in oil colours? Explain your answer.

**ANSWER.**—The difference between photographing a landscape and an oil painting is very great.

(1) The exposure in the latter case must be very much greater than in the former. In photographing the landscape, the light from a vast area is concentrated by the lens on the small area of the sensitive plate, and must necessarily be very much more intense than that reflected from the comparatively very small area of the painting.

(2) The gradation of tone, contrast, etc., in the copy of the painting will not be influenced by the time of day, state of the weather, etc., as when photographing the landscape.

(3) Colour. In a painting the contrasts of colour must often be exaggerated to give the impression of greater varieties of light and fulness of colour than can be actually produced by artificial pigments. The "actinic" value of the colours being so different to their "visual" value, the impression rendering of the colours in the photograph will be much more noticeable than it would be in a photograph of the landscape. In a painting also, yellow tints prevail when representing landscapes in full sunshine. As we know that yellow has little effect on the sensitive film, those parts which appear brightest in the painting will appear very dark in the photograph, so that to obtain a good copy of an oil painting it is absolutely necessary to use an orthochromatic plate and also a colour screen.

WORFIELD.

Answers have been received from and marks awarded to A. C. S., Developoid, Worfield, Lindum, R. C. M., Electra, Biarritz, Sunesis, E. B. C., Spain.

## Societies' Meetings.

**NOTE.**—In this column the Editor can of necessity only give a brief summary of the proceedings. Papers read before societies will appear in the PHOTOGRAPHIC REPORTER, and the Editor of the REPORTER will be glad to receive reports for insertion as early as possible after the meetings have been held.

**Bath.**—The second annual general meeting was held on the 25th ult.; Mr. W. Pumphrey presided. The Rev. C. Reay Pughe was elected a member. The report, which was then read, stated, *inter alia*, that the present number of members is 81. The Treasurer's statement shows that the Society is in a sound financial position, and the Committee look forward to the coming season as likely to be in every respect as successful as those that have passed. The election of officers for the ensuing year then took place, when those who had previously served were thanked for their services and re-elected by unanimous vote as follows: President, Mr. W. Pumphrey; Vice-President, Mr. Austin J. King; Committee, Mr. Braham, Mr. Greene, Mr. Perren, Mr. Pitt, and Mr. Powell; Hon. Secretary and Treasurer, Mr. Middleton Ashman, 12, Old Bond Street. The official business disposed of, technical subjects were next dealt with. Captain Harrison, Cheltenham, showed an album of prints, whole-plate size, illustrating winter sketches. Mr. Aug. F. Perren exhibited and described the details of the Watkins exposure meter. The Secretary showed Samuel's patent hand-camera, the Policeman hand-camera, the Perpetual time and instantaneous shutter, and Ballard's actinometer. After the business of the meeting had been concluded, Mr. Wells discoursed on the subject of "Lantern Slide Making."

**Bolton.**—The Society celebrated the opening of their new rooms in Rushton Street, off Corporation Street, on the 5th inst., by the holding of a dinner and subsequent "talk" in the new premises. The Society has been in existence since 1879, and has now a membership of over seventy. They used to meet at the Baths, in Bridgeman Street, but the arrangement was found to be very inconvenient, and after due consideration it was determined the society should have rooms of its own, where the members could work when unable to go outside owing to climatic influences, and also where specimens of different classes of work executed by the members might be exhibited. A couple of rooms were secured in Rushton Street and which overlook the Co-operative Society's premises in Bridge Street and one advantage about this selection is that besides having a good light there is opportunity afforded for extension when funds will allow. At present there are two rooms, one of which is to be a "dark room" for the use of members, and the other as a general conversation and lecture room. In the latter room there is a screen made in the wall of plaster of Paris, and upon which subjects under discussion will be illustrated by the aid of the oxyhydrogen light. The subscription for an ordinary member to the Society is 10s. per annum, and 5s. for open membership. The President, Mr. Bridson, occupied the chair at the dinner. The rooms contained some excellent photographs, and there was also some apparatus on view.

**Bournemouth.**—At a meeting on the 25th ult., an interesting paper was read by Mr. Paul H. Price, on "Photographic Printing," dealing exclusively with silver printing-out processes. After mentioning various kinds of silver paper suitable for printing, he called special attention to the gelatino-chloride paper of Obernetter, with which he held the best results could be obtained, provided some care were taken in the operations. Mr. Price dealt with different methods of preparing negatives for printing, such as varnishing, retouching, etc.; also vignetting and the making of vignettes. After describing printing frames, he considered the subject of light for printing, explaining a way of obtaining diffused light for doing this in the sun, then went on to the best methods of toning, the apparatus required, and the baths used by different workers; also the washing of prints and how to dry them, so as to impart a dull or brilliant surface, as well as mounting the finished photograph. All the chief prints were well illustrated by specimens and diagrams, the paper being followed by a discussion. Dr. Hyla Greves, President of the section, occupied the chair.

**Brechin.**—The usual monthly meeting was held on the 3rd inst., Mr. G. Mackie, A.Ph.S., in the chair. The Curator of the Association, Mr. J. C. Middleton, gave a short but very instructive address on "Lantern Slide and Transparency Colouring," and strongly recommended the members to finish their slides with colour, as he considered they would be greatly improved thereby. He thereafter exhibited some of his own work, giving very full descriptions of how it was done. Mr. Ross said he was not greatly impressed with the ordinary commercial coloured slides, and thought that good plain slides were better than most of the coloured slides we see. A short discussion took place, in which Mr. Middleton was supported by Messrs. Mackie and Brown, and Mr. Ross by Mr. W. M. Vallentine. Bailie Lawrence then exhibited some slides of American and South

African views. It was intimated that the next monthly meeting would be held on April 7th, when the AMATEUR PHOTOGRAPHER Prize Slides would be exhibited, members being invited to bring their friends.

**Cardiff.**—At the ordinary meeting on the 6th inst., the President (Mr. C. F. Gooch) in the chair, the following gentlemen were elected ordinary members of the society: G. H. Hodges and B. McCallum. The President invited the attendance of the members to an excursion by the Naturalist Society to Newnham next Friday, and trusted they would return with some good negatives of that wonderful phenomenon, the "Severn Bore." The American lantern slides were then passed through the lantern, and were generally admitted to be the finest collection of slides exhibited during the winter session. On the 27th ult. the members of the Cardiff Photographic Society were treated to a lantern display, consisting of hedgerow, cottage studies, and statuary by the Woodburytype process and a selection of views by Wilson, all of which were above the average. The lecturer was Mr. E. Lewis, who also manipulated the lantern.

**Cambridge.**—An interesting meeting took place on the 4th inst. The experiment of practical enlarging was very successful, each member bringing his negative and enlarging therefrom. Mr. G. H. Potts kindly loaned his lime-light lantern for the evening, and managed it with great skill. Several members availed themselves of this opportunity, and had some excellent results.

**Croydon.**—During the fiercest blizzard which has been recorded for the past ten years, the above youthful but enterprising Society celebrated its first birthday anniversary by holding a public dinner at the Greyhound Hotel, Croydon. We understand that between sixty and seventy tickets were taken by members, but a considerable proportion of the guests were prevented from assisting at what proved to be an exceedingly pleasant and enthusiastic function. The chair was occupied by the President, Mr. Th. Maclean, F.G.S., supported by the Vice-President, Dr. H. J. Strong, J.P., the Rev. J. H. C. McGill, Mr. W. E. Woodbury, and various local photographers. In an able and powerful speech Mr. McGill proposed "Prosperity to the Croydon Camera Club," and specially dwelt upon the educational value of the practice of photography in elevating the artistic faculties and in causing us to hold converse with nature, thereby leading our thoughts above the workaday materialism which so greatly environs our lives. The President in replying, shortly reviewed the progress of the club from its inception, and stated although it was no doubt well to be able to look back upon a well spent-life, he preferred, and asked the members to join him in doing so, to look forward and overcome any remaining obstacles which might stand in the way of success. He urged the members to work hard that the forthcoming exhibition might be a distinct and creditable display of their abilities, and stated he hoped that the collection to be shown on the 31st would be the precursor of a much larger one which should be open to all. Other topics touched on were the future home, and the possibility of obtaining the co-operation of an important minority. The President also stated that the number of members elected to date was, in round figures, eighty. Mr. Isaac having proposed the healths of President and Vice-President, Dr. Strong in his reply treated members to a long but lively anecdotal description of his photographic experiences, from which it appears that he is probably the father of the flock, inasmuch as his experience dates from the fifties, when he manipulated the daguerrotype process. He also offered the club a collection of the works of the late Mr. Donkin for exhibition. As evidence of the enthusiasm with which members are inspired, one of them who had arranged to take a flash-light of the company, having left part of the apparatus behind, travelled back home in the middle of the meeting a distance of over five miles through the icy wind and driven snow, and got back about 11.30, in time to burn an amazing quantity of magnesium powder, in the endeavour to get a negative of the company. Before breaking up, the assembly in violation of all precedent, again drank the President's health with musical honours. "Auld Lang Syne," sung with great fervour considering the lateness of the hour, brought this notable gathering to a satisfactory termination. The walk home at one in the morning was something to remember.

**Croydon Micros.**—At the meeting on the 6th inst., Mr. W. Low Serjeant in the chair, Mr. H. Fry demonstrated, and gave a lengthy explanation on "The Uses of Bromide Paper," illustrated by a fine series of examples, both contact and enlargements; some good examples of warm tones obtained by toning with uranium were also exhibited, showing that bromide prints are not confined to the usual cold grey tones. Several members took part in the discussion. On the 16th inst. a meeting of the photographic section will take place to discuss and arrange the summer excursions and rambles.

**Dewsbury.**—The annual conversazione of the Dewsbury Amateur Photographic Society took place on the 5th inst. The President (Mr. A. S. Marriott) delivered a brief address, and then followed exhibits of apparatus, lantern views, and stereoscopes. Some interesting photographs were taken in the room by the aid of a flash-light, and the pictures subsequently thrown on the screen.

**Ealing.**—A meeting was held on the 5th inst. The chair was taken by the President. Mr. George Willis was unanimously elected a member of the society. A paper on "Intensifying and Reducing Gelatine Negatives" was read by Mr. Rowland Whiting. The next meeting will be a technical evening, on the 19th inst.

**East Southsea.**—The fortnightly meeting took place on the 3rd inst., when Mr. J. Clemmins, President, gave a practical demonstration on "Lantern Slide Making," which was much appreciated. Mr. J. J. Thornton, who has promised to give a paper at an early date, exhibited copies of his recent prize winning slides.

**Hastings.**—The next meeting will be held at the Brassey Institute on the 16th inst., at 8 p.m., when Mr. H. F. Bultz will give a paper on "Realistic Photography."

**Herefordshire.**—A meeting was held on the 6th inst., when the AMATEUR PHOTOGRAPHER 1890 Prize Lantern Slides were exhibited to an appreciative and large audience, the room being filled to excess. Altogether a series of 190 slides were thrown upon a screen. The figure studies were particularly interesting, and caused much amusement. After the Prize Slides were finished, Mr. T. J. Salwey, of Ludlow, showed several very good slides, mostly taken in the neighbourhood of Ludlow and district of the Teme, and other local subjects, which brought a very pleasant evening to a close.

**Holborn.**—The above club held its second annual exhibition on the 7th inst., when a very fine display of pictures were brought together. The President (Mr. T. C. Hepworth) and Mr. F. A. Bridge acted as judges, and the prizes fell to the following members: Class I., for the best exhibit of pictures that shall be the most numerous and meritorious: 1st, Mr. Fred. Brocas; 2nd, Mr. S. T. Chang; 3rd, Mr. H. Beckford. Class II., for the best six quarter-plate pictures: 1st, Mr. W. H. Osborne; 2nd, Mr. T. C. Phillips. Class III., enlargements: 1st, Mr. J. E. Smith; 2nd, Mrs. J. E. Smith. Class IV., for the best six pictures taken by a lady member: Mrs. J. E. Smith. Mr. F. Brocas' set of twenty-two whole-plate pictures made a most excellent show. Mr. S. T. Chang's set of eight whole-plate pictures were in his usual careful style. Mr. H. Beckford's set of six half-plate pictures contained some of his very unique and excellent photographs of the interiors of cathedrals, which this gentleman makes a special study. In the quarter-plate competition, Mr. W. H. Osborne comes well forward, especially as he is quite a beginner. For the lantern slide competition, the first prize fell to Mr. S. T. Chang for a fine show of architecture, Mr. Beckford coming second, Mr. Bayston taking third place. In spite of the bad weather, there was a very good attendance of members and friends, about seventy, but probably this was because of the cinderella which the club always adds to its exhibition. A great feature was the dance programme, which was printed on bromide paper, and contained the portraits of the officers of the club. There were about 200 pictures very tastefully arranged by the energetic Treasurer, Mr. Albert Bell, and Mr. S. T. Chang, as is his wont, brought his flash lamps and cameras, and made half-a-dozen exposures. The prize pictures will be on show at the Club-room on the 20th inst., when the prizes will be distributed to the successful competitors.

**Holmfirth.**—The ordinary meeting was held on the 27th ult., the President, Mr. Arthur Preston, in the chair. A most interesting evening was spent with the stereoscope, several members showing their own work. The first outing was arranged for 14th inst. The Secretary, Mr. David Bilson, will be glad to hear from any one wishing to join the society.

**Ireland.**—An informal smoking meeting was held on the 6th inst. Mr. Alex. Conan related his experience of twenty years as an amateur photographer, and was listened to with a great deal of interest by those present. He exhibited a number of prints taken from the wet-plate negatives of his early days as a photographer, which left very little to be desired, and which were in excellent preservation.

**Leeds.**—On the 5th inst. the AMATEUR PHOTOGRAPHER Prize Lantern Slides were exhibited before the members of this Society, the President (Mr. Godfrey Bingley) being in the chair. The following slides in the various classes are worthy of special mention:—Landscape, "The Pass of Killiecrankie," by Mr. W. Gladstone; Californian scenery, Mr. P. T. Foster; Swiss views, by Mr. C. G. Davis; Welsh and Matlock views, by Mr. Godfrey Bingley (President of the Leeds Photographic Society, and winner of the gold medal in this class). Figure studies, "How he Told his Love," and "Nothing half so sweet in life as love's young dream," Mr. W. F. Clarke; "Waiting for a Job" and "The Stone Cutter," Major Lysaght; Russian studies by M. Gratschieff; "Love and Harmony," "The Love Letter," and "Love's Young Dream," by Mr. J. E. Austin, winner of the gold medal in this class. Animal studies and instantaneous pictures, "Entering Port," by Mr. A. D. Guthrie; "Return from the Fair" and "Robin and Nest," Mr. E. J. Bedford; "Cart in Snowstorm" and "Swans," by Mr. W. H. Shirley; "Toilers," "A Porpoise," "Gale at Morecambe," and "Divers at Singapore," by Dr. B. Furneaux, winner of the gold medal. Agricultural studies, Interior of the Municipal Buildings, Glasgow, Mr.

J. Watson; Bayeux Castle, Mont St. Michel, and Church of S. Pierre, by Mr. J. A. Sinclair; views in Gloucester Cathedral and York Minster, by Mr. E. Beck; entrance at Eaton Hall, verandah and library at the same place, by Mr. F. W. Wade, winner of the gold medal in this class. Altogether a very enjoyable evening was spent, many of the slides exhibited showing considerable artistic feeling, combined with technical excellence on the part of the exhibitor.

**Lewes.**—At the meeting on the 3rd inst., the President in the chair, demonstrations were given as follows: The President, Mr. J. G. Braden, "Matt-surface Prints Toned with Platinum;" the Vice-President, Mr. J. Tunks, "Silver Prints Toned with Gold;" Mr. G. J. Wightman, "Hot-bath Platinotype." Great interest was taken in the demonstrations, and specimen prints by each process were shown. The Hon. Secretary handed round copies of Mawson and Swan's diary, Crystal Palace Exhibition prospectus, circulars giving particulars of the "Radial" hand-camera, and a sample "cartridge" of eikonogen, sent by Messrs. Marion and Co., also sample packets of the "Barnet" plate. A special meeting was held on the 7th inst., when members and their friends were shown some lantern slides. Next meeting, April 7th, lantern slide competition, the last lantern night of season.

**Lewisham.**—At the meeting held on the 6th inst., Mr. Alfred H. Miles in the chair, the prints and slides of the recent competition were exhibited. The judge of the prints was Mr. H. Bedford Lemere. The first prize in Class A was awarded to Dr. Dashwood for a small platinotype print, entitled, "Evening;" the second prize to Mr. H. J. Turney for a bromide print of Bonchurch. In Class B the judge withheld the first prize, and awarded the second to Mr. H. Harvey-George, the Secretary of the Great Yarmouth Society, for a fine picture, "Why Doesn't he Come?" In Class C., Mr. H. Howell gained the first prize for a "Sailing Barge" study, and Mr. E. B. Eastwood the second. The judge also highly commended prints sent in by Messrs. Castle, Townsend, Davis, Rogers, and E. Eastwood, and expressed his approval of the work sent in on the whole. M. A. R. Dresser judged the slides, awarding the prizes as follows: Class A, Mr. R. Lanchester; Class B, Mr. Malcolm Stodart; Class C, Prof. Lambert and Dr. Dashwood. He also commended slides sent in by Messrs. Castle, Rogers, Davis, H. Harvey-George, Howell, and Rogers. The next meeting of the Club takes place on March 20th, when Mr. Charles W. Hastings will show the Prize Medal Slides.

**Maidstone.**—In connection with this society Mr. L. Stansell gave an interesting lecture at the Old Palace on the 4th inst. The subject of the lecture was "Prize Lantern Slides."

**Morley.**—The annual meeting was held on the 3rd inst., the Vice-President (Mr. J. H. Spence) in the chair. The Secretary read the report of the past year, and balance-sheet, which was adopted, showing the Society to be in a healthy condition. The election of officers was the next business, which were as follows:—S. Atkinson, President; J. Sanderson, Vice-President; S. Tomlinson, Treasurer; H. Leathley (Peet Street, Morley), Secretary; Committee, Messrs. Smith, Richardson, and Spafford. The members then partook of a coffee supper provided by the President, Mr. Atkinson. It was decided to have the meetings hereafter the first Tuesday in each calendar month, instead of fortnightly.

**North London.**—At the meeting on the 3rd inst., Mr. Few in the chair, the Rev. E. Healy exhibited a hand-camera, and said that Messrs. Adams and Co., of Aldersgate Street, were bringing out a new improved camera upon the principle of the one shown. Mr. Healy also exhibited his small camera with single lens for taking stereoscopic negatives, and Mr. Bishop explained how, by exposing each half of the plate in its true relative position, the negative could be printed from, and the pictures mounted with true stereoscopic effect without cutting and remounting them. Mr. Hudson also exhibited one of the Newman and Adams latest instantaneous and time shutters with pneumatic break. The annual exhibition, which was unavoidably postponed from the 3rd inst., will take place in the Wellington Hall, on Tuesday evening, the 17th inst.

**Notts.**—Under the auspices of the Castle Gate Literary and Debating Society, Mr. Richard S. Armitage delivered on the 2nd inst. a lecture on "Snap Shots," in which he gave an interesting account of the development of the art of photography. Councillor R. C. Sutton presided, and there was a good attendance. The Chairman alluded to the old-fashioned and awkward methods which had been in vogue for taking photographs, and said they were to be shown that night the conditions under which photographs were now taken, how they could be struck off at once without any preparation on their part, so quickly that their blandest smile could be caught before it had time to vanish away, and even in the most striking positions. He had pleasure in introducing the lecturer, Mr. Armitage, who said it was twenty years since he started photography, showed a number of photographs, taken by the various processes, by means of the oxy-hydrogen limelight; and explained the nature of the latest development in connection with photography.

**Oxford.**—At the meeting on the 3rd inst., the President (Mr. E. A. Ryman-Hall) gave a very interesting exhibition of lantern slides

of sea and cloud views. Other slides were also shown. This exhibition was instead of the President's lecture on "Photo-micrography," which he was unable to give on that evening. At the next meeting, on March 17th, an exhibition of apparatus will take place.

**Phot. Soc.**—On the 4th inst., J. Glaisher, F.R.S. (President) being in the chair, Mr. Leon Warnerke delivered a lecture on "A Simplified Photo-collographic Process," to a crowded audience. Instead of a glass or metal plate as is usual in the collotype process, Mr. Warnerke makes use of a gelatine film supported upon vegetable parchment. He demonstrated the method of sensitising and drying the film, explained the process of printing, and passed round for inspection before and after printing, and after washing with water. He then demonstrated the method of printing, and showed its application to wood engraving, to canvas, and to the decoration of china and porcelain. A short discussion ensued, in which Messrs. J. Spiller, J. D. England, V. Blanchard, and the lecturer took part. The walls of the room were hung with between two and three hundred examples of collotype printing, kindly sent for exhibition by the Autotype Company, Bemrose and Sons, of Derby, the London Stereoscopic Company, Rommler and Jonas, of Dresden, L. Rouille, of Paris, F. Thevoz and Co., of Geneva, and Waterlow and Sons. It was announced that the exhibition would remain open for a month.

**Putney.**—The meeting on the 28th ult. was a lantern evening. March 11th, a lecture by Mr. G. Davison (Camera Club). The 25th will be a lantern evening.

**Richmond.**—The meeting on the 6th inst. was a lantern-night. Mr. F. P. Cembrano presided. Mr. C. Hussey, of Croydon, having happily recovered from his recent indisposition, was present to give his twice-postponed demonstration of the collodio-bromide process, which accordingly preceded the usual lantern business. Mr. Hussey, after a few general remarks upon lantern-slide work in general, and the advantages he claimed for his favourite process, went on to describe very lucidly the *modus operandi*. Starting with the cleaning of the glass, he first showed how to coat a plate, his practice being to use no mineral acid in cleaning, and no substratum in coating the glass for fear of contaminating the emulsion; next three plates were successively exposed, developed, and fixed, and the demonstrator proceeded to illustrate the great advantage which he claimed for his process; namely, that whereas a gelatine plate after development and fixing passes practically out of control, a collodio-bromide plate is, at that stage, as a cliché to work upon, being readily susceptible of almost unlimited variation in density and tone. After Mr. Hussey had been cordially thanked for his valuable and interesting demonstration, and a few remarks from the Chairman on the merits of the rival processes, the lime-light was turned on, and one of the newly made slides was the first to be passed through the lantern, proving to be of admirable brilliancy and tone. Other slides by Mr. Hussey followed, showing a wonderful range of tone, and there were then exhibited slides by Messrs. Williams (a visitor), Ardaseer, Lowry, Davis, Ennis, Irvine, Hodgkin, and Cembrano. Many of these were "first attempts," and as such were considered promising. Next meeting, Friday, 13th inst., "Photometers and Actinometers."

**Sheffield Camera Club.**—The opening meeting of the session was held on the 6th inst., and took the character of a social evening. The President, Mr. G. T. W. Newsholme, in the course of his remarks, made reference to the aims and objects of the club, pointing out that the science of photography could be promoted by the comparison of work and discussion of the various methods of production without the stimulus of competitive exhibitions. He held that the production

of good work should be sufficient reward in itself. During the evening an exhibition of slides by limelight took place of works by Professor Arnold, Dr. Manton, Messrs. Winder, Slater, Copley, and Maleham, and an excellent series of slides by Wilson, lent by Mr. Copley, was also shown. Cameras, stereoscopes, and photographic apparatus of all kinds were exhibited by Mr. J. Preston, Messrs. Chadburn Bros., the Sheffield Photographic Company, and Mr. J. Christie. Ten new members were nominated.

**Sheffield.**—The ordinary monthly meeting was held on the 3rd inst., Mr. B. J. Taylor in the chair, when, after the election of new members, the evening was devoted to the exhibition of the AMATEUR PHOTOGRAPHER 1890 Prize Lantern Slides. Mr. J. W. Charlesworth manipulated the lantern, Messrs. Beck and Hibbert describing the pictures, which were without doubt some of the grandest scenes possible to imagine, views in Switzerland, Italy, Scotland, Yorkshire, etc. Selections of music, both vocal and instrumental, were given during the evening, which was thoroughly enjoyed by the large number of ladies and friends present.

**South London.**—At the meeting on the 6th inst., a paper was read by Mr. W. Groves, on "Shutters," and illustrated by diagrams which he had prepared to show the efficiency of the various makes at present in the market. Messrs. Marion and Co., Geo. Houghton and Son, and Watson and Son kindly lent a number of specimens, and with those brought by the members fully twenty different styles of shutters were on view, a most instructive evening being passed. The society resolved to take part in the exhibition to be held at the Crystal Palace in competition for the challenge cup.

**Southport.**—The usual weekly meeting was held on the 4th inst. Being the first Wednesday in the month, the evening was spent as a "social," when a number of stereoscopic views, also a large assortment of photographic and other interesting novelties were exhibited. Two first-class 15 by 12 negatives of Salisbury Cathedral, and one of "Stonehenge," taken by Mr. Dunmore (the President), were much admired. The society is progressing very favourably. Intending members will receive fullest information on applying to the Secretary, Geo. R. Cartmel, 4, Bradley Street.

**Southsea.**—At a meeting on the 4th inst., Mr. R. Leventhorpe opened a discussion on "Development." After giving his own experience of the various developers in use, he said he much preferred pyro and ammonia for negatives, whilst for lantern slides he liked quinol, provided a full exposure had been given. Messrs. Cobb (Vice-President), Thornton, Ogle, Lemley, and the Hon. Secretary took part in the discussion.

**Sydenham.**—A meeting was held on the 3rd inst., the President in the chair. The Hon. Secretary reported that at the request of the Committee he and Mr. Rumble had attended the meeting of the London and Suburban photographic societies to consider the question of federation. On Mr. Pigott's proposal, these two gentlemen were requested to again attend as delegates on behalf of the Club, and to act as they thought best in its interests. At 8.30 the lantern was started, and a number of slides by various members were exhibited and commented upon.

**Wolverhampton.**—The usual monthly meeting was held on the 3rd inst. Mr. H. Holcroft occupied the chair. Mr. Lees was elected, and Messrs. A. C. Lloyd and Laythe were proposed as members. The "Illustrated Boston" slides were exhibited, and Mr. H. E. Perry undertook to read the lecture accompanying the slides. The usual vote of thanks was given to the Boston Camera Club, Mr. H. E. Perry, and the lanternist, Mr. Derrington.

## To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.

5. The Editor does not undertake to answer questions by post.

6. In answering Queries, correspondents are requested to mention, in every instance, the *number and full title of the query* referred to.

## QUERIES.

4552. **Positives.**—Would anyone kindly tell me how to make the formula and developer for taking positives on glass or metal?—A BEGINNER.

4553. **Dry Plates for Positives.**—Would any reader kindly inform me where I could purchase these plates in England, for making positive pictures? Are they manufactured in America. Cannot get to know name of agent in our town.—NOTTINGHAM.

4554. **Hayes, Kent.**—Can any reader inform me as to places of interest in the neighbourhood, suitable for photographing?—A. S.

4555. **Printing on Wood.**—Will any brother amateur tell me how to print from a negative on to wood, as I want to have a printing block made from it; also which wood is the best to use?—W. J. NEWBY.

4556. **Walking Stick Stand.**—(1) Can any one

tell me of a reliable walking stick stand not more than three feet in length when closed, and extending to five feet? I do not want one which requires guy ropes, etc. (2) Can any one tell me of a skilful man who would carry out a design for a walking stick camera stand?—EBORACUM.

4557. **Red Tones.**—How can red tones be obtained with Thomas's lantern plates? The solution recommended by the makers for developing gives red tones which dry to a purple colour.—E. M.

4558. **Portraits.**—Is it better to take a portrait (I take them out of doors) with a slow plate and large stop or with a rapid plate and small stop, and what would be the exposures for this time of the year?—M.

4559. **Lens.**—Why is a single lens better for landscape work than a double one?—LENS.

4560. **Varnish.**—Would any reader kindly give a cheap recipe for paint or varnish (or both) for inside of dark box, to resist the action of water and chemicals?—G. H. S.

4561. **Copying.**—Would anyone kindly tell me how I can copy a mounted e.d.v. on a quarter-plate negative? Any hints will be acceptable. I have a half and a quarter-plate camera.—CHESTER.

## QUERIES UNANSWERED.

March 6th.—Nos. 4548, 4549, 4550, 4551.

## ANSWERS.

4500. **Coloured Glass Luminous.**—The only plan would be to paint it with a luminous paint, like Balmains, but as the colour of this light is blue and the spectrum is a narrow band between G and F in the blue, it would be practically useless for red and yellow.—OSIRIS.

4503. **Fog.**—Try a fresh paper.—WILLEE.

4503. **Fog.**—This is rather a difficult question to answer; probably the paper is of poor quality, or it may be that too strong a light was used for printing. Why not send the negative and print to the Editor, and ask his advice?—OSIRIS.

4506. **Artistic Lighting.**—Get H. P. Robinson's valuable little book, "The Studio and What to Do in It." This will tell you all you want to know and a lot more.—OSIRIS.

4506. **Artistic Lighting.**—Write me through Editor, and I will reply by letter.—WILLEE.

4509. **Kaleidoscope.**—A simple one can be made by merely placing beads, coloured glass, etc., between two lantern slide covers and making it turn round by means of an endless screw. One like this can be obtained from almost any lantern dealer for 5s. 6d., but a complete kaleidoscope costs 37s. 8d.—OSIRIS.

4510. **Hypo and Alum.**—According to Mr. Wall's article, p. 116, Feb. 15th, chloride of magnesium cannot replace hypo in the combined toning and fixing bath, and he has also stated that the use of tannin for hardening gelatin-chloride prints turns them yellow.—OSIRIS.

4512. **Coating Waste Plates.**—The cause of your poor results with plainly salted gelatine is due to the combination of the gelatine with the silver. The only plan to get good results is to make a gelatin-chloride emulsion like Aristotype paper and coat the plates with this. Formula will be found in Wall's "Dictionary of Photography," 2nd edition, p. 101, et seq.—OSIRIS.

4512. **Coating Waste Plates.**—To do this you must learn how to make emulsion, which, without you have a lot of spare time, I should not advise you to do, for in the end you will find it cheaper to buy new plates.—WILLEE.

4514. **Shutter for Detective Camera.**—Mawson and Swan, 33, Soho Square, London, have one of this kind called Soman's, which is a very good one.—OSIRIS.

4514. **Shutter for Detective Camera.**—Write to Marlon's, and state what you want. They have a shutter to suit you, and works from 1,000th part of a second up to any length of time.—WILLEE.

4517. **Relief Seals from Photographic Negatives.**—See p. 170 of AMATEUR PHOTOGRAPHER, March 6, or you could use either the wash out or swelled gelatine process.—OSIRIS.

4517. **Relief Seals from Photographic Negatives.**—Write to Mr. Wall through Editor; he may assist you.—WILLEE.

4519. **Frames for Quarter-plates.**—Brown, Scott, and Co., 254, High Holborn, E.C., quote quarter, half, and whole plate black and gold frames.—OSIRIS.

4520. **Hand Camera.**—In the "British Journal Photographic Almanack," 1890, page 584, you will find what you want.—WILLEE.

4521. **Interior.**—Ross' No. 8 P. S. lens is only 10 in. focus, and would therefore be a wider angle than necessary. If you used a 15 in. focus lens you would have rather less of the subject included, but the perspective would be more pleasing.—OSIRIS.

4521. **Interior.**—You are using a lens with too short a focus; an ordinary 15 by 12 R.R. would suit the work much better. Stop it down to  $f/44$ .—WILLEE.

4522. **Robinson's Developer.**—A great deal depends upon the plate you are using. The best method to increase the density is, when all detail is out, to add a full dose of pyro and bromide and allow to act.—OSIRIS.

4522. **Robinson's Developer.**—I have used this with success. Your want of density is through not using sufficient pyro solution, thus, after getting out all the detail, add 1 dr. more pyro solution and wait for the density.—WILLEE.

4523. **Platinotype, Sepia Tones.**—(1) The addition of 1 per cent. of mercuric chloride to the developer is stated to give sepia tones. The hot bath is said to give the best results. (2) Yes, to be obtained to order. (3) By using a cool solution and allowing it to act longer; a great deal also depends on the negative.—OSIRIS.

4523. **Platinotype, Sepia Tones.**—You will find L. Clark's "Platinum Toning" very useful to you, published by Hazell, Watson, and Viney, Ltd., 1, Creed Lane, E.C. price 1s.—WILLEE.

4524. **Lantern Slides.**—Expose a plate to very weak diffused light for a brief moment, then develop with a weak pyro developer, fix, and wash well; this gives a beautiful fine focusing screen. There is no advantage in using a stop, provided the image is sharp without it.—OSIRIS.

4524. **Lantern Slides.**—Take out your ground-glass and put in the place of it a clean negative glass without scratches; to see anything on it, you must use a focussing glass, when you will be surprised at the amount of detail you can see. Use stop  $f/22$ .—WILLEE.

4526. **Development for Bromide Paper.**—Dip a camel-hair brush in your bromide solution, and

lightly brush the portions you want to stop coming up too quickly.—WILLEE.

4526. **Development of Bromide Paper.**—10 per cent. solution of bromide of potash applied with a brush.—OSIRIS.

4526. **Mountant.**—Good stiff starch paste.—OSIRIS.

4527. **Hire of Studio.**—So far as I am aware, this cannot be done, but I should apply to a rather small professional and ask him, as a man with a not very large business might be glad to make something in that way.—OSIRIS.

4528. **Development, Hand-Camera Negatives.**—Try Chapman's, of Manchester, Eiko-cum-hydro formula, which has given me excellent results when used at a temperature of 50 to 60 degs. F.

Hydroquinone ... ..	40 gr.
Eikonogen ... ..	120 "
Sodium sulphite ... ..	480 "
Citric acid ... ..	20 "
Distilled water ... ..	20 oz.

(B).

Potassium bromide ... ..	5 gr.
Sodium carbonate ... ..	60 "
Sodium hydrate ... ..	30 "
Distilled water ... ..	20 oz.

For use, mix in equal parts.—OSIRIS

4529. **Frames for Quarter Plates.**—Write to Slater, frame maker, Southampton Street, Camberwell, for price, which will be higher than carte-de-visite size, which are mostly German made.—WILLEE

4530. **Black Tones.**—Add 1 dr. to every ounce of the ordinary ferrous oxalate developer, expose at three feet from gas flame, giving relative increase of exposure. Short exposure and strong in iron developer will give black tones.—OSIRIS.

4531. **Optimus Hand-Camera.**—An excellent instrument, well worth price, of good workmanship and very efficient.—OSIRIS.

4534. **Saturators.**—See the "British Journal Almanac," p. 401, 1890.—OSIRIS.

4535. **Reflex Camera.**—The camera is an excellent practical one, and is fitted with a 5 by 4 Optimus, and is of good workmanship except the slides, which might be improved. Shutter from about  $\frac{1}{100}$  to  $\frac{1}{1000}$  sec. Results are very good.—MEMNON.

4537. **Borax Bath.**—Almost any make gives good results with this bath. Edwards, Scholz, Blackfriars Company, Written, etc.—OSIRIS.

4537. **Borax Bath.**—Spicer's paper will suit the above.—WILLEE.

4538. **Studio, Lighting of.**—See answer to 4508.—OSIRIS.

4539. **Cutting Mounts.**—Can trace no directions for cutting mounts anywhere. Send stamped addressed envelope for instructions for oval drawing.—OSIRIS.

4540. **Hand-Camera.**—We would be pleased to lend one of our Companion hand-cameras to "Hoyer."—FARRER AND CO.

4540. **Hand-Camera.**—Try Lawley's, Farringdon Road, or Sands and Hunter, Cranbourn Street, Griffin's, Garrick Street, Covent Garden, or advertise in the Exchange Column.—OSIRIS.

4540. **Hand-Camera.**—Write to G. A. Taylor, Queen Victoria Street. They used to lend out kits on leaving the value of them.—WILLEE.

4541. **Dark Tent.**—Try the Optimus umbrella, price 25s. Shew's changing box, 12s. 6d.—OSIRIS.

4542. **Ebonite Trays.**—Try P. B. Cowhill and Co., Cheapside, or the City Rubber Company, Queen Victoria Street.—OSIRIS.

4543. **Barnett's Dark Slides.**—Certainly Barnett's slides are good, very good, far ahead of the clumsy wooden ones. If you use films, they are just what you require; your "kit" will also be considerably reduced in weight.—J. B. ELLAM.

4544. **Developers.**—(1) Notwithstanding its disadvantages and the host of rivals that have sprung up of late years, the old pyro-ammonia or pyro-potash still seems to be the general favourite for all-round work, but, (2) in the hands of a beginner, a made-up hydroquinone developer would perhaps prove more advantageous, owing to the great latitude it leaves for exposure, and its being less liable to stain than the foregoing.—WIZARD.

4544. **Developers.**—(1) Hydroquinone and hintonone. (2) Hintonone, as it is a simple and reliable developer, sold in 5 oz. bottles, for two and a half pints of developer, by Messrs. Hinton and Co.—B. W.

4545. **Permission to Photograph.**—Permits are granted for Hyde Park, Kensington Gardens, St. James's Park, Green Park, Greenwich Park, Richmond Park, Bushey Park, and Hampton Court Palace and Gardens upon application by letter to H. W. Primrose, Esq., H.M. Board of Works, Whitehall, S.W., available for six months. For Victoria Park, Battersea Park, Embankment Gardens, and all open spaces under control of County Council, H. Delahouke, Esq., Clerk to the Council, Spring Gardens, S.W., available till end of year. For Kew Gardens, the Director, Royal Gardens, Kew, for one year. Windsor Great Park and Virginia Water, Captain Walter Campbell, Holly Grove, Windsor Park, Windsor, available for fourteen days.—A. NAYLOR.

4548. **Mounting Opals.**—Having soaked a little of Nelson's soft gelatine, melt in a hot-water bath, and

pour into an open dish. Take the print by both ends, bring them together, forming a bow with the face outwards. Now gently float on the gelatine, letting the centre touch first, and gradually lowering the ends till it lies perfectly flat, face downwards. Gradually slide the glass under the print and having got the latter into position, gently lift the glass and squeegee into optical contact and allow to dry.—WIZARD

4548. **Mounting Opals.**—The best method is as follows: Take a piece of good glass and a porcelain dish which will hold it; then make a solution of gelatine as follows: pour over 300 grains of hard gelatine, half-pint of cold water, when quite soaked pour off and with hot water make up to 10 oz. If the heat is not sufficient to melt gelatine, place near fire until temperature is 120 degs., pour the gelatine over the glass plate until  $\frac{1}{2}$  in. above it (glass); soak print in water until quite soft, and place face downwards in solution. Now take the glass and print out of the gelatine and apply a squeegee to back of print so as to press out superfluous solution (or for small prints if pressed out with ball of thumb will do just as well). (Do not put a second glass on back). When dry it is ready to be framed, etc.—CHAS. SHER.

4547. **Victoria, Australia, Photographic Apparatus for.**—You will find the "Itakia" magazine camera the most suitable for this climate, owing to its being made entirely of metal. It carries twenty-four plates and is very light in weight.—R. V. FISK.

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED: AM: PROT:

**NOTE.**—In this column we cannot advise upon purchase of APPARATUS, PLATES, PAPER, or PHOTOGRAPHIC MATERIALS.

Advice will be given upon questions of "Photographic Procedure," negatives and prints will be criticised, and every help given to the worker in photography.

A. E. VENN.—Why not write to the Photographic Dealers and Manufacturers' Association?

H. F. C.—"Art of Retouching," by J. Hubert (Hazell, Watson, and Viney, London, 1s., cloth 1s. 6d.), is the most practical book. Take them to an optician's; if the scratches are only slight, they will not affect the picture. At any good firm of lantern manufacturers.

C. P. ARMSTRONG.—Have written to you.

MAJOR A. DOWDALL.—Will try and write you next week; cannot spare time this week.

W. A. BOOKLEY.—We cannot undertake to recommend cameras by letter or in any other way than that described in the "Note" at the head of this column.

C. BALLARD.—To ensure insertion, reports should reach us at latest on Tuesday mornings.

FREDERICK.—Short notice in AMATEUR PHOTOGRAPHER of January 23rd.

C. HETHORN LEWIS.—All right; by all means if you will kindly point out the faults.

A. D. GUTERIE.—Duly received your letter. Will certainly do as you suggest.

S. MANSELL.—Print to hand; many thanks.

F. C. CURRY.—Your letter has been mislaid; please repeat queries.

F. TURNER.—Write to Mr. Gambier Bolton, at the Camera Club, Charing Cross Road.

W. O. S.—See the note at the head of this column.

THE PROFESSOR.—The reason of the curved lines is that you were too close to the object. The lens cannot be altered. With respect to your last question, see the note at the head of this column.

S. FRANCIS CLARKE.—Thanks for letter. The suggestion shall have our consideration.

ELECTRA.—See notice at the head of this column.

UMBRIA.—(1) Yes. (2) Yes. (3) No. 2.

R. C. G.—The spots are metallic silver reduced by splashes of some liquid; had you any ferrous oxalate or pyro developer handy? (1) Fair, wants rather deeper printing, and half inch of foreground off won't hurt. (2) Very soft, but spoilt by the movement and the patchy background. (3) The boat should have been in the left-hand corner so as to break the water up a bit more, otherwise good. (4) Very poor. (5) A fair evening effect if printed well, the posts might well have been more included.

P. R. S.—There is certainly the germ of good work in your prints; a little more patience, perseverance, and attention to minor details will improve matters. (1) Good, only the whole edifice is toppling over towards the left; you want a level or plumb indicator. (2) You evidently wish one to have an idea of sunshine from the cloud, which is not good; the rest of the print is extremely dull and monotonous, the bits of trees do not improve it. (3) Not so bad. (4) Very flat, over-exposed and under-developed negative. (5) Very fair; the softness is by no means unpleasant in effect. (6) Good,

(7) Flat and over-exposed; could have been improved in developing; your sitters are all too fond of staring in the lens. (8) Bad, the long wall is utterly devoid of any artistic properties. (9) Rather flat, too much foreground. (10) Good. (11) The whole edifice again on the slant. (12) Very bad, a plate utterly wasted. (13) Poor. (14) A good representation of a backyard corner with a sitter. (15) This sitter evidently was uneasy somewhere. (16) Capital, a few like this redeem your work.

**HYPO.**—There are special bromide pencils sold by most dealers specially for retouching bromides. You might try soaking the print in a weak solution of chlorine of gold, about 1 gr. to the pint; this will sometimes improve things.

**RESUMÉ.**—(1) To explain this thoroughly will require more space than we can spare; briefly, the sensitive salt of silver affected by light is reduced to the metallic state by the alkaline solution of pyro, the halogen set free combines with the alkali, and the pyro is oxidised. (2) The advantage of stock solutions is that it is not necessary to weigh out your pyro every time; sodium sulphite prevents the spoiling and staining of the pyro; in the formula you give the sulphite is in the wrong solution to be of any use. (3) Use a slow plate, and place it in contact with the negative; expose to the light of a lamp or gas about 3 feet off for a short time, then develop with ferrous oxalate.

**C. CHURCHILL.**—(1) Yes, quite satisfactory, and no special objection. (2) It will keep well. (3) Yes. (4) It is not likely to get out of order. (5) No.

**J. E. THORNBURN.**—We have not yet seen the camera, but hope to do so shortly.

**W. R.**—8, 7, 6, 5, 4, 3, 2, 1. Glad you are so satisfied. You must not be hard on beginners.

**SANDS.**—No. 1. This is due most probably to the bad light. The instrument is all right. The negative is very much under-exposed. No. 2. The indistinctness in the eyes is probably due to movement of the same. No. 3. We should like to see the negative before we express an opinion on this. The toning solution is all right. Wash the prints in plain water first. Always pleased to help you. Let us see some more work when the light gets better.

**W. S.**—You cannot improve upon the lenses you have named, though you will hardly need the single landscape wide angle. Always glad to be of service.

**H. K. GLAZEBROOK.**—We will write you by post.  
**J. W. C.**—We know of no such firm, nor can we trace it at all. If you like to send us the lens we will examine it for you.

**H. HAMMOND.**—Is this the only plate that shows this defect? Notwithstanding your letter, we still think it is dust; try we again.

**H. S. W. B.**—(1) Do you mean with lens complete; send us an addressed envelope, and we will write you. (2) Certainly the fixing bath for prints must be distinctly alkaline. (3) About 12 in. The flash is not better; we prefer the instantaneous for this work. (5) The only thing to do is to soak in water till it leaves the mount without any trouble.

**QUESTER.**—Send addressed envelope, and we will write you.

**J. THOMAS.**—Focus for the required figure, getting it as large as possible, then on the negative paint out everything but the figure with black varnish.

**C. H. S. (New York, U.S.A.)**—Neither camera is suitable for stereoscopic work; you must have a square bellows for this. We should advise you to get D holder. If you like to send a list of instruments we will state the most suitable, or will write you privately.

**SPIKE.**—The plates were fully exposed, but wrongly developed. The formula is all right. The plates show 15 on Warnerke's sensitometer. Add your accelerator by degrees.

**VIC.**—You do not state the aspect of your window. We should advise pasting deep ruby paper on the window and make a curtain of ruby medium to draw over it when light very bright. (2) We should prefer very stiff starch paste to glue, which might affect the prints.

**W. T. BARTON.**—(1) We prefer first a sheet of ground glass, then a sheet of deep orange and then cathedral green glass. It sounds rather as though the slides were at fault. (2) Stick to pyro, make up the stock solution of pyro and dilute as wanted. Try the American standard accelerator given in "Dictionary." (3) The print was very good indeed; we like to see such work, also (4 and 5) Do you mean portrait or landscape? you must be governed solely by the effect. Write us again if not quite clear on what we have said.

**B. A. SMITH.**—The instrument named is as good as any at the price, and the lens gives good results, and the question as to the work being up to competition standard, depends more on the user than the lens; the one in question is about 8½ in. focal length. About 45 degs. About 9 or 9½ in. would be about right. The R.K. lens is a doublet, you cannot therefore, compare it with a totally different lens.

**A. STRADLING.**—There is no difficulty in doing what you want. Make a transparency on a lantern plate by contact printing from your small negatives, then enlarge from this on a 12 by 10 plate coated with an emulsion as used for lantern plates, using No. 3 lens, and develop with a well restrained pyro and ammonia developer. You would find it cheaper to get an enlarged negative made for you by one of

our advertisers. Still the albocarbon light is preferable to daylight. The slow bromide paper is eighty times slower than the ordinary plate. You ought to get excellent results, judging from the print you send. We shall be pleased to help you further if necessary.

**FESTINA LENTE.**—Monday is our reception day, from two to five; can you give us a look next Monday? In the meantime we will try plates. If you cannot call, then let us know developer used and fixing bath.

**H. W. THORNTON.**—Your bar is a little too hot, and the handle should be turned from you. We should advise you to use a lubricant. Practise on a few plain cards first.

**T. HALL.**—Probably your solutions are too cold. Try water at 70 deg. F., then write us again, and let us know what formula you use, and paper.

**NOVICE.**—Both your sitters are a little too serious, and the half-open mouth spoils it; still, very fair, considering conditions. The avenue is very good. Here is what you want, from Wall's "Dictionary of Photography":—

Chloride of gold...	15 gr.
Common chalk...	150 "
Chloride of lime...	24 "
Lime water...	15 oz.

Add the gold to the chalk, make into a paste with a little lime water, and leave for one hour; filter, and wash the filter with the remainder of the lime water, in which is dissolved the chloride of lime. Add 1 oz. of above to 10 oz. of water for every sheet of paper. The prints must not be absolutely free from silver before toning; wash for five minutes only.

**FIRST ATTEMPT.**—O: A little bit under-exposed, and you don't want the figures. Very good, however; let us see some more work in a month. D: Certainly stick to one developer.

**YORKSHIREMAN.**—(4) Long focus about one and a-half times the longest side of plate used. (5) The portrait is good. How on earth did you get that tone? Try your luck in a competition, by all means, only don't get that tone again.

**J. H. TAYLOR.**—Book packet not yet to hand. We will note next week, if too late for this.

**J. THOMPSON.**—The idea is by no means new. The old developer may be used, but, of course, it gives somewhat harder pictures, as it contains more bromide from the exposed film. Many operators prefer, however, to use the old developer, with one-fourth new either mixed with it or else added towards the end of development. There is no authoritative record of how long an old developer will keep; about a fortnight, perhaps. A one-solution developer is by no means new. The following is given in Wall's "Dictionary":—

Neutral oxalate...	2,600 gr.
Ferrous sulphate...	975 "
Citric acid...	100 "
Boiling distilled water...	20 oz.

¼ oz. of this, diluted with 6 drms. of distilled water, is about the usual strength. A one-solution developer can also be made by adding dry ferrous oxalate to saturated solution of neutral oxalate till it is no longer dissolved, and then excess is added, and allowed to stand 24 hours and used as above.

## Quarterly Examinations in Photography.

### QUESTIONS.

25. A gelatino-chloride and an albumenised paper print will be forwarded to you, and the same must be returned toned, fixed, washed, and mounted, with method of procedure, and any remarks you may think necessary on the prints from an artistic as well as the technical standpoint. If by accident a print should be spoilt in the manipulations it must still be returned.
26. What are the arguments for and against the adoption of the metric system of weights and measures? (Limit, 350 words.)
27. Give the formulae for conversion of metric weights into English weights, and vice versa, and what is the recommendation of the Photographic Convention as to the bulk of stock solution formulae and their strength?

(Latest Day for Answers—March 23rd.)

### RULES.

1. Answers must be received on the morning of the Monday week following the publication of the question.
2. All answers must be preceded by the question,

and should be written on one side of the paper only.

3. A *nom de plume* may be used, but in every case the full name and address must also be given.

4. Answers must not exceed 250 words, unless otherwise stated by the examiners.

5. Those desirous of competing must apply to have their names entered, as these examinations are intended to encourage the study of the theory and practice of photography. Authorities upon photographic matters and contributors to the photographic journals will not be allowed to compete.

Marks will be given for all answers, and when possible, the three best answers will be published. Three prizes will be awarded at the end of each quarter.

All communications to be addressed:—

"EXAMINATION DEPARTMENT,"

AMATEUR PHOTOGRAPHER,

1, CREED LANE,

LONDON, E.C.

## Sale and Exchange.

**RULES.**—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

**Backgrounds.**—Two backgrounds in flatted oils, on linen and roller, garden scene, with graduated centre, size 8 ft. by 8½ in., price 15s.; garden scene, with foliage, size 8 ft. by 7½ in., price 12s., quite new and perfect; photographs forwarded.—Address, William Hare, Photographer, Sutton, Surrey.

**Bicycles.**—Rosebery Safety, 30 in. wheels, tangent laced spokes, hollow rims, 3¼ in. tyre, semi-racer, geared 60 in., ball wheels, crank, bracket and pedals (rat trap), with lamp, etc., 38 lbs.; the reason owner wants to dispose of above is that he is going in for racing, and through no fault of machine; price £8; further particulars on application.—Can be seen any time at 66, Newington Butts.

Sarley and Sutton's Rover safety, special made, double brake handles, ball bearings everywhere, including pedals, central carrier for half plate camera, lamp, bell, accessories, good as new; sell at half the cost.—Putland, Tunbridge Wells.

Safety bicycle, cushion tyres, balls everywhere; £7 10s.; just cost £14; approval with pleasure.—Cyclist, 7, Dereham Road, Norwich.

**Burnishers, etc.**—Burnisher, whole-plate, good condition, with 3-wick lamp, cost 50s., take 20s.; also good stereoscope and 12 interesting views, all new, cost £1, take 10s.—Taylor, Photographer, Worksop.

Burnisher, Tylar's 9 in., good condition; 9s.; cost 16s.; write—Upton, 33, Finsbury Circus, London.

9 in. burnisher, as new; cost 35s.; take 10s. 6d., or exchange.—Christie, Staines.

**Cameras, etc.**—Half-plate camera (by Stereoscopic Company), perfect condition, with 3 double dark-slides; £4; deposit; approval.—W. Turner, Woodville, Lytham.

McKellen's patent half-plate camera, five double slides, turntable, legs, and leather case; cost £14; bargain, £8.—Knowles, Chemist, Cleckheaton.

Whole-plate camera (by Oadwick), quite new, with six Barnett's slides and Platt's new turntable and stand, conical bellows, long extension, and reversing back; cost £8; will sell for £6; approval with pleasure.—No. 123, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Watson and Sons' 10 by 8 Premier camera, in solid leather case, with one double dark-slide, two inner frames for taking half plates, two printing frames, Ashford tripod, all new; price £11; no cards.—Crags, St. James Villa, Maidenhead.

Lancaster's international, quarter-plate, Iris diaphragm, instantaneous shutter, tripod, two wooden slides metal slide, and adapter; 39s.—Archer, 100, St. Paul's Road, London, E.

Lancaster's special brass-bound Instantograph, three brass-bound double backs, See-saw shutter, tripod, etc., complete perfectly new, in case, with lock and key, also dishes, printing frames, etc.; 70s. the lot.—Edwin Jewitt, Matlock Bridge.

Sands and Hunter's Exhibition quarter-plate camera, new last month, focusses to 13 ins., every possible movement, three best slides, and tripod stand; £5; list price £7.—Hodges, 87, Chancery Lane.

7½ by 5 parallel, long extension, double pin on camera (by Reynolds and Brauson), three back slides, Eastman roll holder, Funnell's shutter, black leather bag for camera, and solid leather case for slides; cost £17 17s.; price £10 10s.; a real bargain.—Smeeton, 13, Broomfield Road, Leeds.

Lancaster's whole-plate 1883 Special camera, perfect condition; approval; deposit; lowest £4, or exchange good half-plate set with rectilinear lens.—Toth, Stephen Street, Rugby.

Lancaster's 1890 International half-plate camera, with three dark-slides (no lens or stand), perfect condition; list price 88s.; bargain, 65s.—G. Beddow, Sutton, Surrey.

Good half camera, slides, lens optional, compact, cheap; full particulars.—88, Albert Road, Croydon.

**Cameras, Lenses, etc.**—Camera, quarter-plate, seven double dark-slides, rectilinear and wide-angle lenses instantaneous and Ponce's shutter, tripod, quantity dishes, chemicals, printing frames, books; 80s.; cost 1/0s.; best London-made, warranted perfect.—Hands, Suffolk Street, Birmingham.

Splendid Victoria camera and four lenses, takes four on quarter-plate, or eight on half-plate; cost £8; will sell or exchange for Tourist half plate, difference in cash.—Institute, Marsden, Huddersfield.

Cusson's half-plate Tourist camera, rapid rectilinear lens, two double dark-slides, tripod, rising front, double swing-back; 90s.—8, Hounsfield Road, Sheffield.

Watson's half-plate Tourist camera, three double backs, R.R. and W.A. lenses, leather case, tripod, pneumatic release, drop shutter; cost £15; price £9.—Arthur Weston, 7, Angel Road, Brixton, S.W.

Lancaster's 1889 Instantograph, with window shutter, lens, stand, etc., complete, £4 2s., for £3 10s.; extra slide, 12s. 6d., for 8s.; three metal double dark slides and adapter, 14s. 6d., for 8s.; changing bag, 12s. 6d., for 7s.; all half-plate, and guaranteed in good condition.—Fred Fenwick, Jesmond Dene, Newcastle, Northumberland.

Followfield's Facile, leather covered, 5 by 4 rapid rectilinear lens four stops; £5.—M. O. Forster, 32, Binfield Road, Clapham.

Lancaster's Instantograph camera, 10 by 8, lens, with shutter, waterproof bag, Watkin's exposure metre, useful burnisher; lot £3 10s.—Cleaton, Spring View, Wigan.

Lancaster's half-plate Le Meritoire camera, rack-work lens, double back and carrier mahogany folding tripod; 37s. 6d.; lens and tripod optional.—F. Elkin, 5, Kemble Road, Croydon, Surrey.

**Camera Cases.**—Leather detective case, with instantaneous shutter, to carry Lancaster's quarter-plate Instantograph; cost 21s. last autumn; sell or exchange.—74, Metal Street, Cardiff.

**Dark Slides.**—Double dark-slides, three Tylar's full plate, for sale; exchange for violin, or lantern accessories, slide tinter, microscope, or kaleidoscope.—Apply, Rev. Dunnett, Bilston.

**Enlarging Apparatus.**—Shenstone's enlarging apparatus for sale, complete, and in good condition, only once used, no condensers required; price £3; the apparatus, being somewhat cumbersome, will not be sent on approval, but is guaranteed.—No. 122, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London E.C.

**Hand-Cameras, etc.**—Kerr's patent hand-camera (12 quarter-plates), without lens; price £2; approval on deposit.—W., The Coppice, Beechfield, Bowdon.

No. 1 Kodak, almost new, in leather case; price 50s.; cost £5.—S., 4, Seville Street, Lowndes Square. Guinea hand camera, fitted with Eastman's quarter-plate roll-holder, pneumatic shutter, finder, and three double backs, takes pictures 4½ by 3½; cost £3 12s.; take £2; only used twice.—London, 70, Pilgrim Street, Newcastle-on-Tyne.

Shew's quarter-plate Bolipase hand-camera, with double backs for eight plates, tourist leather case and sling, four-fold ash tripod stand (by Hume, Edinburgh), in first-class condition; £6; approval; deposit.—Welch, Crossgate, Cupar, Fife.

Hand-camera, for pictures 2½ by 2, in case, covered with good leather, 8½ ins. by 4½ by 4½; the bellows camera with three double backs and rapid rectilinear lens (all by Wratten and Wainwright), and Thornton-Pickard shutter, enclosed in box as above, with finder, most handy and compact, and beautifully finished; cost £10; only reason for selling, want larger size; condition good as new.—H. K. Glazebrook, Melling, near Liverpool.

Rouch's Eureka, perfect condition; cost £6 8s.; price £5.—Apply, Miss O. Gilpin-Brown, Sedbury Park, Richmond, Yorkshire.

Hand-camera, Samuel's quarter patent, new, 42s.; rectilinear lens, 7 by 6, hood, stops, working f/8, 25s.; canvas camera case, strong, good straps, leather-fitted, 9s.; approval.—1, Hermitage Mews, Stamford Hill, N.

For sale, or exchange for salmon tackle, Rouch's quarter-plate hand-camera, in leather case, improved shutter, detachable plate reservoir, and extra long extension to suit any lens.—E. J., 13, Bell Street, St. Andrews, N.B.

**Lanterns.**—Biunial, brass fronts, mahogany body, four doors, 4 in. condensers, portrait lenses, safety jets, slides, new last season; what offers?—Greaves, Hudding Street, Oldham.

Eastman's 110s. enlarging lantern, cash, or exchange half-plate set.—Simpson, 48, Old Nelson Street, Lowestoft.

**Lenses, etc.**—For sale, a pair of Harrison's Globe W.A. lenses, 3 in. focus, cost £4 16s., price £2 10s.; Levi's portrait lens, 15s.; Lerebours and Secretan's quarter-plate portrait lens, 15s.; quarter-plate portrait lens, 10s.—F. R. Upcott, 135, Brigstock Road, Thornton Heath. (Can be seen at the offices of the AMATEUR PHOTOGRAPHER.)

Dallmeyer's 6D, No. 12909, perfect condition.—Offers to Sanitas, 82, Jenkin Road, Brightside, Sheffield.

A splendid Lerebours 5 by 4 portrait lens, cost £4 10s., first offer for 25s.; also quarter-plate Abra-

ham's Liverpool, cost £3 10s. recently, great bargain, £1; both guaranteed.—Lloyd, 98, Kensington, Liverpool.

Ross' No. 5 portable symmetrical, £4; whole-plate Furnell's shutter, 18s.; both new last season.—H., 55, Val Pleasant, Jersey.

Dallmeyer's No. 2B portrait lens for £5 10s., good condition.—Lux, care of Werge's Photographic Stores 11A, Berners Street, London, W.

Half-plate rapid rectilinear f/8 lens, Waterhouse stops, good condition; 21s.—H. Rowe, Wallbridge, Stroud.

Rapid symmetrical whole-plate lens (by Ross), little used; price £5.—Captain Fleming, United Service Club, Edinburgh.

Ross' No. 3 portable symmetrical, 5 in. focus; 50s.—Abbott, 36, Pilrig Street, Edinburgh.

**Negatives.**—50 quarter-plate negatives; sell cheap.—Hughes, 3, Colville Gardens, Bayswater, London.

**Sets.**—1891 Lancaster's quarter-plate Le Merveil-leux set, new; bargain, 15s.—Wm. Wallace, 9, Clifton Street, Glasgow.

8 by 5 R.R. lens, Waterhouse diaphragms (by Spicer), for 35s.; quarter-plate ditto (Newton), 15s.; bamboo walking-stick tripod, 15s.; Lancaster's half-plate brass-bound Instantograph set, 90s.; all perfect, and in good condition.—Moore, 7, Market Square, Hanley.

Half-plate 1890 Instantograph, three double slides, R.R. lens, Thornton-Pickard foreground time and instantaneous shutter, and folding tripod, all in excellent condition; price £5.—Chappell, 12, Anhall Road, Battersea.

**Shutter.**—Kershaw's Instantaneous shutter for sale, 2½ in. diameter, only used once; price 15s.—Charles Shaw, Blantyre by Glasgow.

**Slides.**—Pumphrey's half-plate Multiplex slide, holding 12 negatives, excellent; 17s. 6d.; approval. Rev. Page, Torquay.

**Sundries.**—Lantern, 4-wick lamp, 4 in. condenser, lens, and microscope attachment; exchange whole-plate camera, without lens or stand.—Lamb, 140, Northbrook Street, Liverpool.

22 whole-plate negatives, views of Holy Land, splendid pair opera or field glasses, dark-room lamp, very fine half-plate R.R. lens, cash or useful exchange.—Jones, Eoifield House, Uffculme, Devon.

Carson's spring carrier, 12s. 6d., cost 18s. 6d.; Sun-beam safety, balls all over, including head, new last season, list price, including lamp, etc., nearly £19; price £11, or exchange for good double extension whole-plate complete set and cash.—Pringle, 34, Arundel Square, N.

"Photographic Reporter," Nos. 11 to 28 inclusive, unbound, as new; cost 12s.; price 7s.; bargain; buyer pays carriage.—Cecil Allen, East Park House, Southampton.

Vols. viii., ix., xi., and xii. AMATEUR PHOTOGRAPHER, 2s. each; also "Year Books" and "Journal Almanacs," 1887 to 1891, 6d. each.—T. O. Hosking, 35, Pavlet Road, Camberwell.

One condenser, new and perfect, cost 84s.; one rolling press, hot or cold, cabinet, cost 60s.; whole-plate Tylar's rack and tank, Marion's "Guide to Photography," "Silver Printing" (Abney and Robinson), Marion's "Photo-Mechanical Printing Processes" (Burton); what offers for any or whole or above? great sacrifices.—Amateur, 16, Lansdowne Gardens, South Lambeth.

For sale, a few ten per cent. preference shares in Eastman Photographic Materials Co., Ltd.—Apply to No. 124, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

**Views.**—Peak of Teneriffe, Great Caldera of Palma, views.—Soar, 1, Sussex Villas, Kensington, London, W.

## WANTED.

"Amateur Photographer," posted regularly weekly from 20th February, cheap.—Copeman, Henstridge.

AMATEUR PHOTOGRAPHER, vols. xi., xii., bound, state lowest price.—Hyde Parker, 37, Burton Road, Derby.

**Cameras, etc.**—10 by 8 camera, Lancaster's preferred, cash, or part exchange half-plate International.—T. Moore, Malling Road, Snodland.

Half or whole plate camera, exchange only.—Greaves, 1, Ridding Street, Oldham.

7½ by 6 camera, preferably Watson's Acme; state price and particulars.—Dr. Roberts, Glyn Rhondda, Porth, Glamorgan.

**Cameras, Lenses, etc.**—Camera, half-plate, state maker, accessories, condition, price; also 7 by 8 Optimus Eyroscope, or other good lens.—Nicolson, 4, Holmhead Terrace, Oathcath, Glasgow.

**Hand Cameras, etc.**—Adams' ideal detective, 12 plates, Wray's R.R. preferred; state lowest; full particulars.—J. B., Hazel Bank, Sydenham Hill.

Hand-camera, of thoroughly good description, in exchange for Rudge Rotary tricycle, cost £20.—Mr. Oxford, Devizes.

Detective camera, quarter-plate.—H. P., South Beach Lodge, Great Yarmouth.

To hire hand-camera from March 24th to about 31st.—Particulars to R. Leversuch, Stanmore, Middlesex.

Lantern, in good condition.—C. H., 78, Isledon Road, Holloway, London.

**Lenses, etc.**—Rapid rectilinear lens, 8 by 5, must be of first-class value.—Roberts, Glyn Rhondda, Porth, Glam.

Wray's R.R. half-plate, Iris.—Howard, 16, Perryn Road, Acton.

Rapid rectilinear lens, 12 by 10, also 12 by 10 wide-angle, by wood maker.—Address, Biddle, 97, Medlock Street, Manchester.

**Sundries.**—Camera case, canvas, to hold half-plate (Biccliffe), three double slides, lens, etc., shoulder strap, in exchange for 50 good lantern slides.—Bilson, Holmfirth.

Elegant in appearance.  
Easily erected.

Strong, yet portable.  
Unique in design and price.  
A wonderfully effective aid to outdoor portraiture.

THE  
**BEST**  
AND  
**CHEAPEST.**

SOLE MANUFACTURERS:

## "A FOOL IS A MAN WHO IS WISE TOO LATE."

THE PHOTOGRAPHIC SEASON is approaching, and the time will come when Winter will ask, What have you been doing all Summer?

There are scores of amateurs who have practised photography for one, two, three, and four years and more, who could not show a dozen properly-finished pictures to-day. They may have scores of beautiful negatives boxed up; often enough they are business men who have not much time for printing, and when a few prints do get finished the best of them are usually given away. A few perhaps get "stuck up" in frames or in an album—often enough the album contains inferior prints—"just as a record, you know!" But perhaps they can show a lot of Lantern Slides; well, that's all right; but our friends can't admire Lantern Slides all the year round. Now, by turning attention to STEREO SCOPIC WORK the whole thing is changed, TRANSPARENCIES ARE THE THINGS. They are easier to make than Lantern Slides. The Stereoscope lends itself to picture-making. A dozen Stereo-Transparencies may easily be made in one evening—and the work has all the fascinations of Developing—they can be mounted the next night, they keep clean, they are permanent, they don't get given away, as do paper prints; they are drawing-room accessories which our wives, or our mothers, or sisters, or sweethearts will take care of, they are the most perfect transcripts of nature photography is capable of rendering; they are always in season, winter or summer, daytime or night, in company or alone. Send for a Catalogue and read "The Stereoscopic Manual," post free, 1s. 2d.

THE Liverpool Exhibition is drawing large houses, and should be seen by all who can spare the time; no remarks in these columns can sufficiently point out the advantages to be derived by visiting such an exhibition. We had the pleasure of paying an official visit last week, when we showed the 1890 AMATEUR PHOTOGRAPHER Prize Lantern Slides to a most appreciative audience. We were much gratified by a request from the Executive that they should be shown again the next evening, Mr. Wm. Tomkinson, a member of the Council, acting as showman. In another column we give a few words upon some of the prize pictures.

LAST week we also had the pleasure of accepting the invitation of the Council of the Manchester Amateur Photographic Society, and had the opportunity of showing the Prize Slides, in the Athenaeum Hall, to an audience of some 700 people, members of the Society and their friends. Our reception was most enthusiastic, and we most heartily

thank the members of the largest amateur society, except the Camera Club, for their kindness. The President, Mr. Davenport, referred to the fact that the AMATEUR PHOTOGRAPHER had, in the early days of the Society, encouraged them in every way. The Society has many AMATEUR PHOTOGRAPHER medallists amongst its ranks. It is what may be called a "well-found" society, runs a capital monthly journal under the editorship of Mr. Wheeler, has a first-class triennial lantern, single lantern, enlarging camera, etc., etc., all for the use of members. The number of elections on the evening when we were present quite alarmed us, no less than thirty-four new members being elected, a society in themselves. We understand that by far the larger number of members are active, and that they take an immense interest in photography. It may possibly be interesting to mention that the first copy of the "Amateur Photographer's Annual" was presented to the Society upon the occasion of our visit. After such a reception as Manchester gave us, photographically and socially, the members of the Society will not be surprised if we pay them another visit at an early date.

On the return journey to London we stayed the night at Leicester, and spent an hour at the Temperance Hall, where Mr. Pierpoint, Vice-President of the Leicester and Leicestershire Photographic Society, was giving an exhibition of lantern slides, assisted by a first-class choir and orchestra. The audience, numbering some 1,800 people, seemed delighted with the pictures projected on the screen. We were much pleased to have the opportunity, kindly accorded us by Mr. Pierpoint, of addressing so large an assembly, and saying a few words of encouragement to the very many present who were interested in photography. Another object of our visit to Leicester was to inspect the extensive optical works of Messrs. Taylor, Taylor, and Hobson, and to which we shall refer next week.

THE Ashton-under-Lyne Photographic Society has been successfully started, with Dr. A. Hamilton as President, Messrs. J. W. Kenworthy, C. E. Redfern, Major Bradley, and Rev. H. J. Palmer as Vice-Presidents. Mr. G. H. Dean, of Crawford Terrace, will be glad to hear from intending members. We believe some sixty gentlemen have been enrolled.

THE letter from Mr. Gambier Bolton, headed "Floreat Etona," will, we should think, find much support, and no doubt a good society will be formed without difficulty.

It will be noted that the Duke of Newcastle, a very ardent amateur photographer, is kindly according to the scheme his help and influence. There are many subscribers who will support the movement.

WE would remind our readers that there will be an exhibition of lantern slides at our offices, 1, Creed Lane, on Monday evening next, commencing at 6.30. Subject, Animals and Instantaneous."

Our publishers tell us that a very large proportion of the first edition of the "Amateur Photographer's Annual" was bought up before the day of publication on Monday last. It is, of course, gratifying to us to find that our "Annual" has "caught on."

WE note that an adjourned meeting of the promoters of the scheme for the federation of the London and suburban photographic societies will be held on Monday, the 23rd inst., at 8 p.m., in the rooms of the Photographic Society of Great Britain, by permission of the Council. The following is the agenda:—

1. That it is desirable to form an association or federation of societies and clubs whose members are interested in photography.

2. That the London and suburban societies be requested to send two delegates to make the necessary arrangements, to settle the name and draw up the constitution of the proposed association, and to fix the terms of membership, etc., the delegates to have power to appoint a committee for this purpose, such delegates to continue to act for a period not exceeding six months from the launching of the association.

3. That the delegates take into consideration the following objects first:—(a) The interchange of lectures, papers, lantern slides, etc.; (b) The obtaining the reduction of railway fares to photographers on their outings, either singly or in parties; (c) The admission of the various societies joining the federation as corporate members of the Photographic Society of Great Britain; (d) Generally to promote photographic knowledge and research.

4. That the delegates be requested to prepare a list of honorary lecturers, who, when disengaged will, without charge or fee, lecture, read papers, give demonstrations and lantern evenings before other societies, and to make rules in connection with expenses, and otherwise.

MESSRS. B. J. EDWARDS AND CO., of Hackney, have called our attention to the paragraph in Mr. Andrew Pringle's article in last week's issue, in which he gives a formula for making plates colour sensitive by the use of erythrosin in conjunction with ammonia. This we find to be protected under the patent held by Messrs. B. J. Edwards for the preparation of isochromatic plates. It is therefore necessary for us to warn our readers that they cannot use this formula without the written consent of Messrs. Edwards and Co.

THIS week's mail brings us news from Grahamstown, South Africa, that an amateur photographic club has been successfully launched, with Dr. Duncan Greenlees as President, and Miss Blaine, of Woodville, Grahamstown, acting as Treasurer and Secretary. The inaugural meeting was quite a success, and we hope some of our colonial brothers and sisters in photography will enter the AMATEUR PHOTOGRAPHER competitions.

A GENTLEMAN, writing from Genoa, says:—"I need hardly tell you how eagerly I hail the arrival of the AMATEUR PHOTOGRAPHER every Saturday, with all its good advice and exhaustive articles."

At the meeting of the members of the Royal Meteorological Society held on Wednesday evening, Mr. A. W. Clayden, M.A., F.R.Met.S., exhibited a series of lantern slides illustrating meteorological phenomena.

WE are pleased to notice the formation of a Stereoscopic Club. The Society held their first meeting last week at Brooklands, near Sale, under the presidency of Mr. W. J. Cunliffe. Mr. I. W. Chadwick, of Manchester, has consented to act as Hon. Secretary. At the meeting, after some discussion, it was determined to adopt  $6\frac{1}{2}$  by  $3\frac{1}{4}$  as the standard size for transparencies; also that the dual pictures should be printed at  $2\frac{3}{4}$  centres measuring the foreground—the "distance" not always being the same—and that when matts are used the openings are to be  $2\frac{1}{2}$  inches wide and  $2\frac{3}{8}$  centres.

We are highly gratified to find that stereoscopic photography is again pushing to the front, and we hope that Mr. Chadwick will not rest satisfied until he has succeeded in giving stereoscopic effect to pictures projected on the screen by the optical lantern.

### PICTURES AT LIVERPOOL.

AT no exhibition has it been possible to see and examine the photographs exhibited, so well as in the Walker Art Gallery. The only difficulty we have to contend with when so many are meritorious is to pick out a few for special notice.

In portraits, Class I., we admire the work of Ralph W. Robinson; he has a charming method in his treatment of children. Messrs. Window and Grove show good work in "Miss Ellen Terry in 'Ravenswood.'" Baron de Brentano has some original work, especially in No. 38. Barraud's "Miss Macintyre" and "Mrs. Kendal" are really studies, but the dry paint enlargements by T. H. Flather are the most beautiful work in the class, the dry point or needle finishing has given such a roundness to the features and limbs as to give the appearance of copies of some of Sir Joshua Reynolds' charming portrait studies. The gradation is perfect, and not a vestige of mechanical treatment obtrudes upon the print. Mr. H. McMichael shows some startling photographic studies, especially his portrait of—as King Lear, Act III., scene 2, "The Storm." We unhesitatingly say that the best true portraiture is to be found in the frame of four pictures exhibited by A. Vandyke, two of which are most striking, viz., the portraits of Mr. Thomas Mayne and Mr. W. M. Tomkinson; no doubt the other two may be equally good, but we have not the pleasure of the acquaintance of either sitter.

In Class II., W. W. Winter exhibits some pretty cabinet photographs, and E. J. Browne some studies of heads, but the class is exceptionally weak. In Class III., W. J. Byrne has tried his hand at some fancy portrait studies, "Water Nymph," "Fisherman's Daughter," etc.—very stagey and very unnatural must be our verdict. In Class IV., still portraits, he is much better, and well deserves a medal for the four life-sized heads, untouched, the best being the portrait of Dr. Selle.

Landscape, Class V. There are some admirable pictures in this class, but we cannot say much for those exhibited by F. M. Sutcliffe; in our opinion, his work has greatly deteriorated during the last twelve months or so; why, we do not know; the author of "Water Rats" ought never to have gone back. The views in Iceland by Dr. J. Reynolds, made familiar to many of our readers through his article in the *Photographic Quarterly*, are many of them admirable. "Downton Mill," by G. Bankart, is a good picture—the best of the four shown by him. Ernest Spencer is a careful worker, and shows care in selection. E. Lloyd Edwards

has a bronze medal awarded him for his four pictures, "A Pool on the Dee," "My Cottage in the Wood" (the best), "Bala Road to Lake Vyrnwy," and "On the Canal, Llangollen." This worker has been pushing steadily on, he is most painstaking, and we are delighted to find his pictures receiving recognition at the hands of so critical a bench of judges. Our American cousin, J. G. Bullock, shows good work, and an especially bold picture in "Currents of the Restless Main." R. W. Robinson has beautiful colour and effect in "On the Hither Side of the Night." Alexander Hamilton's Alpine views are very fair; the best is certainly "The Gorner Glacier, Zermatt." Mr. F. D'Arcis earns his medal; "Twilight" is a most perfect picture, and shows clearly that this competitor takes no hackneyed view of the beauties of nature. E. S. Gladstone shows a fine effect in his "Sunset, Capenoch." David Lewis, who we seem to remember as a medal taker in 1888, has some choice pictures, of which the best is "A Normandy Cottage." The views of Aysgarth, especially the one of the Church, by the Rev. F. W. Stow, shows much discretion in selecting point of view. "Lincoln," by Cyril S. Cobb, is a good picture. William Bedford shows four lovely pictures, which we are surprised the judges should have overlooked, all are perfect, but the best is "Down Dale." The hoar frost studies by E. A. Gollidge are flat, and will not compare with the excellent pictures of hoar frost exhibited by S. G. B. Wollaston; 232 is, to our mind, the best, the picture is in such perfect balance, and the subject treated with exquisite care; the next best is 233. E. M. Tunstall has a rather good picture in "Cattle at Bidston," only there is too much foreground.

In Class VI. Mrs. Hignett has a charming picture, "St. Ives." S. Bourne sends four very choice and well-selected pastoral pictures rather after Gale; the best is "Wayside Gossip." We have seen better work of E. B. Wain's. H. Lupton's is of good average quality, and "Teesdale, near Barnard Castle," is a photograph with considerable merit. Arnold J. Cleaver has an admirable view of "Durham Cathedral," which though much photographed makes a charming picture. Wm. Tomkinson deserves his medal; we like "Peel Castle, Isle of Man," best, but 271, "Rocha's Hotel, Glengariff," is a clever picture. We were pleased to see a frame of photographs by T. Mansell, who has just been awarded the AMATEUR PHOTOGRAPHER medal for one of the pictures exhibited, "Winter's Morning, Bidston."

Class VII.—No photograph in this class calls for special comment.

In Class VIII. T. Zacharias takes a medal for four landscapes of average merit. A. H. Hignett shows some good views on Loch Achray, well chosen and composed. A. W. Gottlieb has some pretty pictures taken in and near Bournemouth. Martin J. Harding sends four of his delightful little studies printed in "Celerotype"; he has secured a good tone and a surface almost like ivory. J. Lamond Howie's work is as usual *petite* and perfect. We liked very much the two views of Ulleswater by F. K. Glazebrook, also the Bettws-y-Coed views by J. L. Mackrell. W. Tomkinson in this class shows "Cloud Scenes, Killarney," which are exquisite.

Class IX. (introducing important figure subjects, which are made to tell a story, etc.)—Of course this class is not a success. There are a few, a very few, decently good pictures which to some extent "tell a story." Fred Anyon's "Is Life Worth Living?" is certainly clever, and the boy model has done his best. His face tells the story. "The Bird's Nest," Mrs. Hignett, is another good study. "Romeo and Juliet," by the Countess Loredana, is too stagey. In the near future these "tell the story" pictures will be conspicuous by their absence; at least we hope so.

"Marine and Cloud Studies." Class X.—Thos. Glazebrook has exhibited some perfectly lovely studies, and has been awarded a bronze medal. A. W. Gottlieb's studies in this class are also very good. S. Bourne, who takes the silver medal, has two of the most perfect pictures in the exhibition, "In the Evening there is Light," and "The Sinking Sun, Killarney." Arthur F. Stanistreet shows good work, and F. D'Arcis "On the Esk," "Low Tide," "Whitby Harbour," and "Off to the Fishing Ground," should be noted by all visitors to the exhibition. A. R. Dresser sends some photographs to this and other classes printed on Fry's naturalistic paper. Is Mr. Dresser going to wear the cast-off cloak of the past champion of "Naturalistic Photography," who has retired in favour of the Do-as-you-please school of photography? Louis Meldon exhibits excellent photographs of the racing yachts *Thistle*, *Iverna*, *Valkyrie*, and *Irex*. H. Dudley Arnott's "Fishing Port" series are very good. A. S. Watson's "The Twilight is Sad and Cloudy," on rough paper, is very well chosen, and the rough surface helps the subject. "Boat Studies," J. L. Mackrell, show careful work and selection.

Here we must leave the Exhibition for this week, contenting ourselves by advising all to go and see the photographs for themselves.

## Reviews.

*Jahrbuch für Photographie und Reproduktionstechnik für das Jahr, 1891.* Edited by Dr. J. M. Eder, published by Wilhelm Knapp, Wien. Price, 8s.

Those who can read German and have ever seen a copy of this year-book, will look with some considerable amount of pleasurable excitement for the present volume, and a rare treat is here in the reading matter. We need not mention such well known names as Eder, Vogel, Pizzighelli, Hübl, Himly, Albert, Angerer, Obarnetter, and Husnik, with a host of others, to be certain of getting something worth reading. Of English contributors there are but four, viz., Bothamley, Chapman Jones, Wall, and Waterhouse, though we find many of note from the English magazines and many a formula by an English worker. We find 320 pages crammed with valuable information in the shape of original communications, and a summary, by the Editor, of the advances made in photography, which takes up another 280 pages. The illustrations are, we think, a little inferior in quality this year compared to last, but even in this respect they are far above anything yet given in the English year-books or almanacs; there are twenty-three in all, and include seven collotypes, two photogravures, and fourteen blocks by the latest improvements in process work. Of the original communications it would be invidious to state the most interesting, but undoubtedly one of the most striking is that by Dr. Zenker, of Berlin, "Die Entstehung der Farben in Photochromie" (The origin of the colours in photochromy), in which the principle of interference as utilized by Lippmann in the formation of the coloured spectral images he has obtained, is clearly explained, and of which we give our readers a précis. We find here also articles on "Chromotypy," by Angerer; "A Normal Method of Development," by Bothamley; "On the Later Advances in Heliochromie," by Eugene von Gothard; "Photography of the Retinal Images of an Insect's Eye," by Dr. Eder; on micro-photography, flash-light work, detective cameras, lenses, shutters, orthochromatic plates, astronomical photography, etc.; and the information given is of the very latest, and certainly in most cases from the pens of past masters in our science and art. The summary, by the Editor, we need hardly state, is of the most complete and exhaustive character, and embraces every branch of practical work.

**Impure Potass Sulphocyanide.**—Mr. J. Hendrick, of King's College, writing to the *Chemical News*, draws attention to the fact that several samples of this salt which he purchased contained chlorine and less sulphur than it should do, and suggests the desirability of testing samples on purchasing. He says the pure salt contains 32.95 per cent. of sulphur, while in one sample he tested there was only 10.1 per cent.

## "SEVEN AGES OF MAN" COMPETITION.

(1)

(2)

(3)

(4)

(5)

(6)

(7)

By A. C. EVANS, ALIJARH, INDIA.

## "The Seven Ages of Man" Competition.

We must own that in this competition we were sadly disappointed. We feel sure that many might have gone in for the "Seven Ages" and turned out pictures. We reproduce the pictures sent us by Mr. A. C. Evans, of Aljhar, India.

It is, we should say, quite certain that although the well-known lines from Shakespeare's "As You Like It" have formed the theme for many a picture, never in the memory of man have they been illustrated with natives of India as models.

Our readers may judge of Mr. Evans' success by reference to the whole-page illustration which we give, and it remains only for us to describe each picture.

No. 1.—"At first the infant, mewling and puking in the nurse's arm." (The infant, aged three months, was taken in her mother's arms; she happened to be passing the camp.)

No. 2.—"And then the whining schoolboy, with his satchel and shining morning face, creeping like snail unwillingly to school." (Is the ordinary Government school in any village of importance.)

No. 3.—"And then the lover, sighing like furnace, with a woeful ballad made to his mistress' eyebrow." (The lover scene was taken on the steps of the railway station; the party were about to proceed by train when I was passing with my camera.)

No. 4.—"Then a soldier, full of strange oaths and bearded like the pard, jealous in honour, sudden and quick in quarrel, seeking the bubble reputation even in the cannon's mouth." (Government sepoy in the service of the Canal Department; one is off guard and the other on duty; both to attention, drawn by the appearance of a stranger in camp.)

No. 5.—"And then the justice, in fair round belly with good capon lined, with eyes severe, and beard of formal cut, full of wise saws and modern instances; and so he plays his part." (The Canal Deputy Magistrate, in charge of a district, and holds the position of a junior civilian of the statutory class.)

No. 6.—"The sixth age shifts into the lean and slipper'd pantaloon, with spectacles on nose and pouch on side; his youthful hose, well sav'd, a world too wide for his shrunk shank, and his big manly voice, turning a gain toward childish treble, pipes and whistles in his sound.

No. 7.—"Last scene of all, that ends this strange, eventful history, in second childishness and mere oblivion, sans teeth, sans eyes, sans taste, sans everything."

Mr. Evans further tells us that he had only one week from the time he read the advertisement to the time for completing the prints. The subjects are all actually from life, in the costumes and surroundings of everyday life in India. The original photographs may be seen any Monday afternoon.

## Letters to the Editor.

### A PLEA FOR YOUNG AMATEURS.

SIR,—I am a member of a photographic society, and find the question is often asked, why do so many fail, and so few succeed? I think one reason is that a new starter is sometimes subjected to the sneers and jeers of older members of the society which he has had the courage to join. He submits his work with fear and trembling. I should advise him to seek out the good fellows, for I am pleased to say there are many who are willing to render the assistance required, and who remember at the same time their own start.

On the other hand, I ask the clever ones to come down to our level, take us by the hand and show us the way, for we are groping in the dark; our purse is low, our opportunities are small, and time limited. Ten minutes of their time will save us hours of anxiety and trouble, besides expense, and at the same time save many of us from stranding with the usual advertisement, "camera for sale," for I find, if only persevered with, photography becomes a pleasure in proportion as it is understood.

I should advise joining the AMATEUR PHOTOGRAPHER Competition. I have sent a print, and, although not successful, the criticism was splendid, true, and honest. It lends an interest in what is going on, besides keeping one up to the mark. Photograph with a purpose, do not copy, be original; the sneering ones you need not fear, for they do not succeed beyond a certain point; let opposition and discouragements act as stepping stones to success. Let a society be for all members; give always a fair field and no favour.—Yours truly,

A. C. C.

\* \* \* \*

### POSTAL PHOTOGRAPHIC CLUB.

SIR,—It has occurred to me that Mr. Baird may feel inclined to start a postal portfolio club in Ireland, and that he and others might be glad of a few hints in drawing up rules, etc. It is just four years since you kindly inserted a letter for me in the AMATEUR PHOTOGRAPHER, by which I got twelve amateurs to join me in starting the Postal Photographic Comparing Club, and it has flourished without hitch or hindrance from that time to the present. We have considerably increased our number of members, and have never found any difficulty in filling up vacancies, which proves, I am happy to say, that the Club is fully appreciated. I enclose a copy of our rules, which, if you please, you can give in full, or an epitome, as you think best.—Faithfully yours,

T. T. S. METCALFE.

Cotswold, Cirencester,  
March 14th, 1891.

### RULES.

1. That the name of this Society shall be "The Postal Photographic Comparing Club."
2. That the Society shall consist of at least twelve members, with power to add to their number.
3. That the portfolio be forwarded monthly by each member to the next on the list by parcels post.
4. That no member detain the portfolio more than three days, exclusive of Sundays.
5. That each member send to the Hon. Sec. before the 27th of each month, at least one whole-plate, two half-plate, or four quarter-plate prints. Members failing to send the required prints, must send, instead, a fine of 6d. for each omission. Any member neglecting to send any prints for three successive months renders himself liable to be struck off the members' list.
6. That the subscription of one shilling a year from each member, and all fines, shall form a fund to pay for cases, hospital albums, printing, or any other club expense.
7. That the Society's year begins May 1st, but each member's year of membership dates from the time of joining, and members are requested to forward their subscriptions, when due, to the Hon. Sec.
8. That each print be mounted on cardboard, to ensure safety from injury, but no mount must exceed 12 in. by 10 in. in size (very heavy thick mounts are not recommended, as increasing weight of portfolio considerably). Members to write their names, together with name of subject and full particulars, on the back.
9. That the Hon. Secretary shall (if possible) obtain the services of a good critic, to criticise the prints before they go round to the members.
10. That members be invited to freely criticise prints circulating, to point out defects, and suggest remedies.
11. That the owner of the print gaining the most votes each month shall receive, as a prize, the two prints that he most likes in that portfolio.
12. That the prints, after they have circulated, may be made into albums by the Hon. Secretary, and sent to hospitals for the amusement of the patients. Any member particularly wishing to have a print returned to him must state this at the time of sending it in, and enclose stamps for its postage.

### THE LIVERPOOL EXHIBITION—A PROTEST.

SIR,—Allow me a small space to state that I consider a grave injustice has been done to the exhibitors in Classes 7 and 9 by the withholding of the medals.

Of course, it is understood that the jurors have power to act thus under two conditions, as stated in Clause 8 of the prospectus, viz., either too small a number of contributors, or insufficient merit in the pictures. Let us see how these points apply to Classes 7 and 9.

(1) As to numbers. An examination of the catalogue will

show that, taking the average of eleven classes, Nos. 3, 4, 12, 18, 20, 21, 23, 24, 25, 26, and 27, with a total of 99 contributors, they average only nine competitors all round (and in four of them only three to six competitors).

In Class 7 they number 13 (with 52 pictures), and in Class 9 they number 21.

We must therefore dismiss the idea that numbers show a deficiency, although in Class 9, as only one picture is permitted, the total of contributors will naturally appear small, but in all fairness ought not to be taken into account.

It will thus be seen that in eleven classes, averaging only nine contributors, all the awards have been disposed of, but in the two Classes 7 and 9, averaging almost exactly double the number of competitors, the medals are withheld. The objection as to numbers cannot possibly stand.

(2) On the score of merit. Of course, the opinions of the jurors must be final. Not having seen the exhibition, I have no opinion to offer, and being a contributor to Class 9 only (of these two), the only remark I have to make is that my own picture having already taken a silver medal (at a society local competition)—on which occasion it elicited very high praise from the judge, a gentleman of well-known standing in photography—would appear to belie the opinion that no picture of sufficient merit existed in this class. I do not mean to assert that no better pictures are in the class, but I think it is a fair deduction from this fact that the judges have, from some cause or other, given undue preference to other classes, and too little consideration to Class 9, and that it is treating the twenty-one contributors to Class 9 with scant courtesy to pass the class over without making any award at all.

No doubt the duties of the jurors were very onerous in dealing with such a mass of contributions, but on behalf of myself and the remaining thirty-three competitors in Classes 7 and 9, I trust they will not object to reconsider their determination and to re-examine these classes with a view to awards being made.

I note also that in Class 9, although "only one picture" is allowed, two competitors appear (by the catalogue) to have two each hung. Vide Nos. 381 and 383, and Nos. 382 and 387.

For obvious reasons I desire to preserve an incognito, and sign myself—yours, etc.,

AN EXHIBITOR.

\* \* \* \*

#### HAND-CAMERA WITH SWING-BACK.

SIR,—With reference to the paragraph in "Our Views" of March 6th, referring to a hand-camera with swing-front, will you allow me to inform your correspondent, and all those who are interested in hand-camera work, that a camera with swing and rising front and capable of being used with lenses of various foci, was provisionally protected by Mr. B. W. Wild and the writer of this letter at the end of last year, and which we hope to have on the market when perfected. So that the demand of your querist has been already anticipated.—I am, dear sir, yours, etc.,

March 14th, 1891. A. R. F. EVERSHED.

\* \* \* \*

#### "FLOREAT ETONA."

SIR,—His Grace the Duke of Newcastle, who is an enthusiastic worker in our art-science, is anxious to see if it would not be possible to start a photographic society or club in connection with the school at Eton, and for this purpose invites old Etonians to write to him or to me here, and any hints or suggestions will be received with pleasure. It is proposed to call a meeting of old Etonians shortly, when some definite plan will be laid before them. A society like this might be the means of doing incalculable good, and I see no reason why it should not be made entirely self-supporting after the first twelve months.

GAMBIER BOLTON.

Camera Club, Charing Cross Road, W.C., March 16th, 1891.

\* \* \* \*

#### VIENNA EXHIBITION.

SIR,—The editorial in your issue of the 27th ult. compels me to reply again. I must request you not to lose sight of the essential difference between our this year's exhibition and preceding exhibitions. In our opinion there cannot be in force at a photographic art exhibition other principles than at other art exhibitions. I explained at length, in a former letter, why we deem it unsuitable to require of our exhibitors the express declaration that the work is their own production. It affords us lively satisfaction to see that men such as Mr. Maskell and Mr. Davison have come forward for our views. Your remarks in

a preceding number cannot by any means move us to alter our interpretation, and still less the text of our circular of invitation to foreign exhibitors. But to put an end to the matter, I, as President, can assure you that at this year's exhibition the members of our club will consider it a matter of honour, as well as of preference, to have done throughout the work sent in.—I am, sir, yours truly,

Vienna, March 7th.

C. SERNA  
(President).

\* \* \* \*

#### CONSTRUCTION OF LENSES.

SIR,—I am reading with much interest the valuable articles on the above subject by Mr. Clement J. Leaper.

The subject is not an easy one to treat in a way that all can readily understand, and the introduction of diagrams naturally affords great help. The illustration on page 129 helps the reader to comprehend "astigmatism," and the assistance afforded by diagrams would be materially increased if the lettering were a little more distinct. These letters easily go astray, and I think the *f* which appears on and between the line *d* and *p* has somehow got on the line just below where it ought to be. On page 130, first column and third line from the bottom, we read, "and again reflected towards *g p*." Now as there is no *p* in the diagram, this circumstance will prove a puzzle to those who are not up in this branch of study.

I trust, therefore, I may be excused for pointing these little matters out, although I am well aware how easy it is for mistakes to occur, yet if a little more attention can be bestowed on these diagrams, it will enhance the already great value of the papers.

I would also express the hope that when lenses are illustrated, the shading indicating the juxtaposition of the different kinds of glass will be so different from each other that anyone will be able to discriminate at once by the look of the shading, which is for flint and which for crown glass.

The shading of the lens diagrams in "Wall's Dictionary" are an example of what I refer to, as they might, without difficulty have differed more widely than they do.—I am, yours etc.,

Brighton, March 16th, 1891.

C. HETHTON LEWIS.

**A New Photographic Relief Process.**—M. Favraud gives the following process for obtaining reliefs from negatives, in the *Journal de l'Industrie Photographique*:—Wash a planished sheet of copper with acetic acid and then with distilled water. Then dry it and coat with the following:—

Tannin ... ..	4 grammes.
Gallic acid ... ..	2 "
Water ... ..	500 c.cm.
Drain, and dry the plate and coat with the following mixture:—	
Distilled water ... ..	1,000 c.cm.
Gelatine ... ..	100 grammes.
Alcohol ... ..	50 "
Bichromate of potash ... ..	10 "
" ammoniac ... ..	10 "
White of egg ... ..	10 c.cm.
Pure glycerine ... ..	10 drops.

When dry, the plate is exposed under a negative, and is then treated with a saturated solution of sulphate of iron, by means of which a strong relief, which is moulded in the following amalgam:—

Bismuth ... ..	4 grammes.
Lead ... ..	32 "
Tin ... ..	32 "
Antimony ... ..	8 "
Copper ... ..	4 "
Mercury ... ..	1 "

Oxygen, as is well known, used to be prepared, and still is, on a small scale by heating a mixture of chlorate of potash, black oxide of manganese and salt. Then Messrs. A. and L. Brin improved on Boussingault baryta process, and their process is now much used, and it is practically treating baryta or oxide of barium in a partial vacuum and forcing into the retort air under great pressure, when the baryta absorbs oxygen from the air, and on the further application of heat, again gives up the absorbed oxygen in a state of great purity, the baryta being ready for further work in the same way. Kastner has now proposed the following plan:—A mixture of plumbate of lime and an alkaline carbonate are heated, when a mutual decomposition occurs, and carbonate of lime and peroxide of lead are formed, and at a higher temperature the peroxide is decomposed into protoxide of lead and oxygen gas. The mixture of protoxide of lead and carbonate of lime is again converted into plumbate of lime by passing a current of air through it, the once charging of the retort being quite sufficient for almost indefinite quantities of oxygen.

# The Construction and Use of Photographic Lenses.

BY CLEMENT J. LEAPER, F.C.S.,

Instructor in Photography, City of Dublin Technical Schools.

## CHAPTER IV.

### TYPICAL PHOTOGRAPHIC LENSES.

*The Simple Lens.*—The first lens employed in photography was a crown plano-convex with its plane surface facing the view. The diaphragm, usually about one-thirtieth the focal length of the lens itself, was placed in actual contact with it, and under these conditions the extent of surface sharply covered equalled about one-fifth the focal length of the lens.

About two years after the introduction of the daguerreotype, a converging meniscus was substituted for the plano-convex lens hitherto employed, the diaphragm being placed in front of the lens at a distance equal to one-fifth the focal length of the latter. Under those conditions the surface covered was increased to one-fourth the focal length of the lens. The concave surface was in this case turned towards the view.

In using such lenses the want of sharpness due to chromatic aberration was allowed for by altering the position of the ground glass after focussing, as increasing the depth of definition sufficiently by stopping down to make the focus for the yellow coincide with that of the blue was out of the question, owing to the want of sensitiveness in the materials then employed.

FIG. 6.

With the very rapid plates now in use, it is possible, however, by the use of a very small stop, to increase the depth of definition of non-achromatic lenses sufficiently to permit of their employment, provided the focus of the lens is sufficiently long. Thus a biconvex spectacle lens of 24 inches focus, used with a stop  $\frac{1}{4}$  inch in diameter, will cover a half-plate with a fair degree of sharpness, and the exposure necessary will not be inordinate, although the lens is actually working at  $f/96$ , and if a quartz lens of similar form is used it will be found that a much larger stop will suffice. The best position of the stop in this case can be found by trial, and varies from  $\frac{1}{4}$  to  $\frac{1}{5}$  the focal length of the lens. Owing to their slowness, however, such lenses are seldom or never employed now-a-days, the correction for spherical and chromatic aberration being effected without reducing the working aperture of the lens to a greater extent than one tenth of its focal length.

*The Single Lens.*—A fairly good type of this lens is shown in fig. 6.\* It consists of a biconvex crown cemented to a biconcave flint, and can be constructed from the following data:—

$$\frac{1}{F} = \frac{1}{f} + \frac{1}{f'}$$

$$\frac{f}{f'} = \Delta$$

$$\frac{1}{f} = (k'j - 1) \left( \frac{1}{R} - \frac{1}{R'} \right)$$

$$\frac{1}{f'} = (kj - 1) \left( \frac{1}{R'} - \frac{1}{R''} \right)$$

in which

$F$  = focal length of combination.

$f$  = focal length of flint lens.

$f'$  = " " " crown lens.

$k$  = index of refraction of flint glass.

$k'$  = " " " " crown glass.

$\Delta$  = ratio between dispersive powers of flint and crown.

$R$  = outer radius of curvature of flint-glass lens.

$R'$  = radii of curvature of cemented surfaces.

$R''$  = inner radius of curvature of crown-glass lens.

The outer radius of curvature of the flint-glass lens ( $R$ ) is chosen arbitrarily in the first instance, and if the combination is found to possess a chemical focus in front of its visual one, the centre of this face is ground down so as to shorten the focus; if, on the other hand, the chemical focus is behind the visual focus, the edges are ground down so as to lengthen it.

FIG. 7.

The position of the diaphragm, depending as it does upon the radius of curvature of the outer flint lens, is arrived at by trial; the nearer it is to the lens the greater the curvature of the field and the less the distortion, and *vice versa*. When stopped down to  $f/30$  the extent of surface sharply covered equals  $f/2$ .

Another and better type of lens is shown in fig. 7, which in this case consists of a converging crown meniscus cemented to a diverging flint meniscus, the relative positions of the flint and crown being thus reversed. In this case the radius of the crown lens having been suitably chosen, one side of the flint lens is made of the same radius, that of the other side being worked so as to yield an achromatic combination according to the principles laid down in the case of the former type of lens.

If the radii of curvature of the crown-glass lens are suitably chosen, spherical aberration will be much smaller than in the former case, meaning, of course, a gain in rapidity.

A third type of single lens recently patented by Messrs. Schröder and Stuart is shown in Fig. 8. In this case the concave and convex surfaces form two nearly concentric spheres, the lens being composed of a plano-convex of high refractive and low dispersive power, cemented to a planoconcave of lower refractive power but of similar or higher dispersive power than that of the convex lens, this latter being pointed towards the object to be reproduced. Taking the refractive index of the glass of the front lens as 1.61, and that of the back lens from 1.50 to 1.53, the following tables enable such a lens to be constructed:

FIG. 8.

Index of Refraction of Plano-Convex Lens.	Ratio of Dispersive Powers of Two Glasses.	Index of Refraction of Plano-Concave Lens.	Ratio of Curvature.
1.61	..	1.53	.. 1.094
1.61	..	1.52	.. 1.109
1.61	..	1.51	.. 1.123
1.61	..	1.50	.. 1.138

These lenses give a considerable amount of distortion, but in the next type of lens (fig. 9) this is reduced to an almost negligible amount when the angle included is not too great. In this case the lens consists of two converging crown menisci, with a diverging flint meniscus between them, the three lenses being cemented together.

The following are the data of construction of this lens expressed as ratios of the focal length of the combination—

\* In this and in all subsequent diagrams the side of the lens facing the view is towards the left.

Focal length of combination	..	..	10,000
Diameter of combination	..	..	2,302

## Indices of refraction—

Flint	..	..	..	1,581
Front crown	..	..	..	1,521
Back	..	..	..	1,514

## Radii of curvature—

Flint	..	..	..	{ + 4,813
				{ - 1,727
Front crown	..	..	..	{ + 1,727
				{ - 6,043
Back crown	..	..	..	{ + 2,561
				{ - 4,813

## Ratio between focal lengths—

$$\frac{\text{Front crown}}{\text{Flint}} = .706 \quad \frac{\text{Back crown}}{\text{Flint}} = .645.$$

Distance of stop from lens, 1,151.

This lens includes an angle of 92 deg. with a small stop, and is quite free from flare spot. When made to embrace such a wide angle, the marginal lines are somewhat distorted, but this distortion is inappreciable when the angle covered does not exceed 50 deg.

Dallmeyer sends out, under the name of the "wide-angle landscape lens," a series of ten lenses of this type, numbering from 1A to 8, having foci of from 5 to 25 in., and capable of covering from a 5 by 4 to a 25 by 21 in. plate.

In all the foregoing lenses distortion occurs at the margins of the plate. For a long time this was believed to be incurable in single lenses, but quite recently Dallmeyer has patented his "rectilinear landscape lens," in which it is completely absent.

As will be seen by reference to fig. 10, this consists of a diverging flint meniscus cemented to a converging crown meniscus, this combination being placed a very short distance in front of a converging crown meniscus turned in the opposite way.

As sent out by Dallmeyer, this lens includes seven numbers, having foci of from 8½ to 32 in., and covering from 4¾ by 6½ to 22 by 20 in.

The following are the data employed in constructing this lens—

		Radii of Curvature, in Inches.	Indices of Refraction.	
			D	G
Cemented meniscus of flint and crown	Flint	+ 2.900	1.574	1.593
		- 1.558		
	Crown	+ 1.558	1.515	1.527
		- 3.342		
Simple meniscus of crown		- 6.001	1.517	1.528
		+ 3.489		

(To be continued.)

**Light and Company, Limited.**—This postal club, which has been started for some time, is now in the hands of Mr. Wallace G. Thomson, of Laurel Bank, Halifax. He will be pleased to receive the names of two or three ladies or gentlemen to make up the full complement of members.

## Studies in Art for Photographers.

By REV. F. C. LAMBERT, M.A.

### CHAPTER V.

It will be profitable to the student to return for a moment, and concentrate his thoughts upon a law or principle which was referred to (though briefly) in Chapter IV., viz., the Law of Principality, or Subordination. It cannot be too often urged that the true student of art is also the constant student of nature, and although, perhaps, one may justly hesitate to declare for the dictum, "that all art is founded upon, and found in, nature," yet the art treasures of all peoples and times go to show that nature and art are practically inseparable. In fact, one may say that nature can be compared to a piece of tapestry having a front and a back, and that art represents the front, which, while not ignoring the existence of the knots and thread ends at the back, yet at the same time is content to look only upon the front, and let the unseen knots and thread ends sink out of mind, as they are—for the most part—out of sight. Turning to nature, it is very easy to see that a large number of natural objects are what naturalists term bilaterally symmetrical, or in other words, that it would be possible to cut these objects into two very nearly equal and similar parts. Most animals have two eyes, two ears, etc., limbs in pairs or in corresponding rows, etc., on each side of the body.

Bilateral symmetry, again, is easily seen in many leaves, in a large number of flowers, and to some extent in the branches of trees. All this goes to show that the principle we first set before ourselves in this course of study, and which we termed balance of lines, etc., has its counterpart in nature. In fact, we may, with almost equal propriety, use the terms balance or symmetry, observing, however, that when using the latter we apply it with some elasticity, seeing that *strict or mathematically accurate* symmetry is by no means universal in nature; and, moreover, it is far from agreeable in art work, other than that of a purely decorative or utilitarian purpose.

Symmetry when carried to excess is apt to give rise to monotony and poverty of design, with a corresponding lack of interest.

Now the careful observer will hardly fail to notice that with this bilateral symmetry in natural objects there is nearly always a central and chief part about which the symmetrical parts are grouped—some central or leading and chief line of growth, or axis about which and in subordination to which all other parts are disposed. Take, for instance, almost any leaf—the first that comes to hand is an ivy leaf—observe the five unequal lobes of the leaf, consisting of two smaller, two larger, and one odd central part. Note also the central mid-rib, stronger and more prominent than the other two pairs, which are given off right and left to the two pairs of symmetrical lobes. Note, too, the symmetry of the venation in each lobe, and also the graduated subordination of the secondary veins in each lobe. Examine other leaves, flowers, branches, and note the great principle of symmetry or balance, about a central axis or chief part. Now the lesson which nature here teaches has been learnt (unconsciously, perhaps) by most, if not all, great workers in art, viz., that with the symmetry there is *beauty in variation*, and that among the symmetrical or balancing parts there is not equality but a *graduation of relative importance*, and finally that there is some *one* part which takes command of all other parts.

Some irrepressible wag has left behind him the story that in the American army there is no one below the rank of "kernel." It is extremely likely that this "great unknown"

tried picture-making on his ideal army lines. But every one knows well enough that the drummer-boy is as essential as the general in command, each in his place; and every picture-maker knows that the same principle applies—"where all command none obey," says the old saw. Where all parts of a picture clamour for attention no one part retains it, is equally true. The law of principality, with its corresponding idea, viz., subordination of parts, applies to all works in which order and design play any part.

It may be easily seen to be a most important element in many musical compositions, in poems, novels, and the drama generally.

When applied to pictorial art its effects are both far-reaching and fundamental. In the first place, we may very properly apply the principle to the leading *lines*, so arranging them that there shall be some one line which leads the eye, easily, almost unconsciously, up to the chief point of interest. This, in a limited sense, may be regarded as the axis of the system, and the balance or symmetry is referred to this as the one chief feature requiring support from both sides. Again, with regard to the different planes in the picture, it is abundantly manifest that the eye does not see with equal distinctness at the same moment objects situated in planes widely separated from each other; hence some one or more planes not separated from each other by any great distance should be regarded as the chief area of interest. Again, with respect to the disposal of the masses of light and shade. The distressing effect of anything like a patchy arrangement has been already noticed; hence it follows that the best and most restful effects are obtained when there is some one (or perhaps two) masses of light and shade which are the dominant light and shade in the picture, to which all others become subordinate, either by being intermediate in brightness, or by reason of their size, their relative interest, or unattractive position. This desirable result is generally secured in the most effective manner by so arranging matters that the chief light and dark, if not in close proximity, are at least not separated by any great distance or important object. By this means *contrast* is secured; but something may be said of that in a subsequent paper.

Last but not least the law of principality applies in full force to the relative importance of the subjects selected for inclusion in the picture. It is clear that if we place ourselves midway between two pianos, upon which the two performers are playing different and inharmonious pieces, no matter how beautiful each composition may be yet the two together produce not joy but distraction. Now although it may be urged that the eye does not see two different things at once, yet, while there is some truth in this, it must not be forgotten that the rapidity with which the eye adjusts itself for distinct vision in passing from point to point is often practically equivalent to seeing two things at the same time, because the impressions conveyed to the brain through the eye are to a great extent accumulative.

Hence where several equally interesting objects are presented to our eyes, we pass so rapidly from one to the other that the impression is a collective one, but the fact of its being a collective impression of several equally interesting objects eliminates to a great extent the individuality of any part or element. The total impression is vague and general, rather than precise or incisive. Hence for good results we must take care that our objects of interest shall not be too many in number (thereby subdividing the total amount of available attention) nor too similar in character (lest they pass into the region of monotony), nor all of equal interest, lest they fight for the chief place, and, like the Kilkenny cats, find their victory in mutual destruction.

What is more tame, insipid, and generally unsatisfactory than the ordinary "group" photograph wherein all are of equal significance (or insignificance)? The temptation to overcrowd out-door scenes with all sorts of objects of interest (and otherwise) into the foreground, the middle and extreme distance seems to be the great temptation of the ordinary "landscapist."

The typical photograph consists of, say, a foreground group, pic-nic party (including the hamper, the dog, and the baby). In order that he may get plenty into his picture, the operator selects a foreground with "objects of interest" in it, as, for instance, some large tree of historic repute. On a large white board in black letters is set forth the number of people who have been hanged, drawn, and quartered in this cheerful place. This entertaining legend is sharply focussed with the greatest care—equalled only by that bestowed upon the wicker-work of the pic-nic hamper, and the dog's tail. Now, by moving a yard or two to the left the operator finds he can include the village and also the church spire in the middle distance, and by going a little further he also is enabled to crown his masterpiece by including a line of cliff, with the harbour and shipping in the extreme distance. The final touch of genius is given by printing in a sky which is in itself quite a study of storm cloud.

This is by no means an exaggerated case, but rather a very average and typical one, all going to show the need of a few guiding principles. If one may judge by the almost universal fault of overcrowding, it would be safe to say that the law of principality or subordination is the use to which the majority of photographers need learn to pay more attention.

At any rate—to sum up—one may say that it is a very useful idea to carry in one's head for general reference, seeing that it applies to all the parts and phases of pictorial structure. It may be applied (1) to the leading lines and groups of lines, (2) to the disposal of the more important masses of light and shade, (3) to the various planes of the picture, i.e., the area of chief interest, (4) to the various component parts which are calculated to claim the spectator's attention, and (5) to the various poetic aspects of the theme selected; but of this matter more can be said after the individual methods of treating the theme by the great masters have received some attention.

(To be continued.)

## Instantaneous Photography.

By W. JEROME HARRISON, F.G.S.

### CHAPTER XIII.

#### PRACTICAL EMULSION MAKING.

PLATES of the best qualities, for general work, are best made by the simple boiling process. But high sensitiveness is most readily obtained by the use of ammonia; and as it is sensitiveness which is our principal—though not our only—requirement in a plate to be used for instantaneous work, we shall describe the practical work of making an emulsion by that method. We have had the good fortune to be "personally conducted" over several of the great plate-making factories now at work in England, and in the course of these articles we shall use the knowledge so obtained to point out what may fairly be required of a plate; together with the principal defects, and their causes.

The actual work of making the sensitive emulsion may be divided into five operations.

(1) Soak 40 grains of Nelson's No. 1 gelatine in eight

ounces of distilled water. Add to this 180 grains of ammonium bromide and 10 grains of potassium iodide. Dissolve the whole by gentle heat, and stir well. The use of the iodide is to give clearness to the plates; it also enables density to be obtained more readily.

(2) Dissolve 100 grains of silver nitrate in one ounce of water. To this solution add strong ammonia until the brown precipitate first formed is just re-dissolved.

(3) From this point all the operations must be conducted in the dark-room, by ruby or orange light. Raise the temperature of Solution No. 1. to 170 deg. F., and add to it, by degrees, 165 grains of silver nitrate, shaking and stirring well. When this has all dissolved, add Solution No. II., and shake well. Then allow the whole to stew for two hours; keeping the heat at 170 deg. F.

After two hours, allow the emulsion to cool to 80 deg. F., and add to it 300 grains of Heinrich's (hard) gelatine. Increase the heat to 100 deg. F., when the whole should dissolve, and stir well. Then set the vessel containing the emulsion in cold water, when the contents will quickly "set" to a stiff jelly.

(4) The emulsion must now be *washed*. This may be effected by squeezing the jelly-like mass through coarse canvas in water; and changing the water repeatedly.

(5) Lastly, add one ounce of alcohol to the washed emulsion; and dissolve it by gentle heat (110 deg. F.). Make up with water to ten ounces, if necessary; and filter by squeezing through swansdown calico.

#### COATING THE PLATES.

In making an emulsion, as described above, there is little difficulty: it is in the subsequent operations of coating the plates, and then drying them (and more especially in the latter), that the need of practice and of special appliances is felt.

The quantity of emulsion we have given (ten ounces) ought to suffice for coating half a gross of quarter-plates.

The filtered warm emulsion is placed in a very small teapot, and is poured upon the clean warm glass plates, over which it is made to spread by a dexterous movement of the hand. The coated plates are then placed to "set" on a levelled slab of glass or slate.

In five minutes the plates will be ready to be transferred to the "drying-box"—a dark box or cupboard, provided with shelves or racks to receive the plates, and through which a current of air is made to circulate. The plates should dry in about sixteen hours, and they must then be packed film to film—with a piece of pure white tissue paper between—and put into the boxes in which they are to be kept.

*Plate-making on a Large Scale.*—The dry-plates made annually somewhere or other on this planet are believed to now amount in value to the immense sum of three millions sterling. On entering a dry-plate factory, we see first the rooms in which the glass is received. The maker usually prefers to coat the glass in a large size, and then to cut it up into smaller sizes as wanted. Thus quarter-plates are seldom or never coated in that size; they are made by cutting up coated whole-plates.

Of the emulsion of gelatino-bromide of silver, about twenty gallons are made at one time. The plates are, for the most part, coated by machinery. They pass on an endless band under a vessel filled with emulsion, which runs out through a long slit. They then pass through a tunnel eight or ten feet long, which is cooled by ice; so that the emulsion "sets" very quickly.

*Drying* is effected in rooms fitted with racks, and supplied with a current of pure warm air. The plates are then cut to size, examined, and packed.

*Isochromatic Plates.*—Ordinary dry-plates have little sensitiveness to yellow, orange, or red light. But by mixing a little erythrosine dye with the emulsion, plates which are as sensitive to yellow as to blue light can be obtained; and these are styled isochromatic or orthochromatic plates. Good results can be obtained on such plates in the yellow light of evening, or in the murky atmosphere of some large towns, when instantaneous work on ordinary plates would be all but impossible.

*Making and Coating Celluloid Films.*—The horny substance called celluloid was discovered by Alex. Parkes, a well-known Birmingham chemist, about the year 1856. But its successful introduction as a "support" for the sensitive salts used in photography did not occur until 1888; and its introduction for this purpose was largely due to Mr. John Carbutt, of Philadelphia, who persuaded the celluloid manufacturers of the United States to experiment until they succeeded in producing a transparent form of the material. This celluloid is made by dissolving "soluble cotton" with a mixture of camphor, methyl-alcohol, fusel oil, and amyl acetate. It is spread out in a liquid form and dried upon sheets of plate-glass. The Eastman Company has just built a large factory at Harrow, near London, for the production of a thin or "rollable" form of celluloid (only the three-hundred-and-fiftieth part of an inch in thickness) for use in their roll-holder. The ordinary or "thick" celluloid is about the hundredth part of an inch thick. Celluloid is coated with emulsion in a similar way to glass plates.

It has only been possible here to give an outline of the method by which our dry-plates and films are produced. Those who intend to practice plate-making for themselves are referred for details to Professor Burton's capital little book, "Modern Photography"—and to Captain Abney's "Photography with Emulsions."

(To be continued.)

## Photographic References.

### DEVELOPMENT.

WHEN everything is ready for the dark-room operations in connection with this branch of the subject which is now under consideration, it must be borne in mind, before proceeding to mix the developer, that chemicals cannot possibly supplement the action which the light effects upon the plate, but they can undoubtedly be used so that the operator is able to gain some control over the gradation and density of his negatives. The light action after the exposure has once been made is an unalterable factor in development, never mind what chemicals may be employed, and it therefore becomes necessary to find out or test in some manner the degree in which the light has acted on the plate, so that some knowledge regarding its requirements can be obtained. Under some conditions its action may not have been sufficient to give all the detail required, owing to the exposure having been of too limited a duration. In another case the exposure may have been too prolonged, with the consequence that if submitted to the action of an ordinary developer, the image would flash out suddenly, and then veil all over with "light fog." Or, if the over-exposure were not in so great a degree that this action was set up, it might be sufficient to cause the developer to act too quickly or energetically for the photographer to be able to exert any

control over its action, which possibly might cause him to lose his negative. It is not possible for anyone to be certain on all occasions that his exposures have been properly timed. This fact being indisputable, it therefore necessitates careful work in the dark-room, for, to some extent, and with experience to a great extent, errors in exposure can, as before stated, be so dodged that the creation of fairly good negatives can be made from plates which have suffered in this way if the nature of the error is discovered in time.

The beginner must not form any erroneous opinions from listening to the assertions which are now being made, that the photographer has no control in development over the gradation of the negative, his power being limited to securing the degree of density which is deemed requisite. Proper development has long been regarded as an art in itself, and one requiring great care and attention. The above assertion is refuted by this fact, and it is not in accord with the practical experience of photographers who have given careful attention to the subject. Theories formed from experimenting under certain given circumstances must not be taken as guides when they are in opposition to practical experience, the result of a lifetime's work under all the variety of conditions which must have existed during the period. The differences which would be seen in two negatives made from plates exposed under identically the same circumstances, but developed by different people, one with little or no experience, and the other by one well versed in the art, would demonstrate the possibilities which exist in the developing room when the photographer has the knowledge required to fully appreciate the power he possesses.

If developing a plate were merely a mechanical routine, then there could be no latitude whatever in the exposure, for it would have to be correctly timed to suit the exact power which the developer exerts. Now it is an accepted fact among photographers of experience that although there is such a thing as absolutely correct exposure, nevertheless there also exists, as already stated, a certain latitude for which provision can be made in the developing room, so that an almost faultless negative can be created from plates that have had a considerably longer exposure than was technically correct. And again, in the event of the exposure having fallen somewhat short of the period which could be pronounced as correct, it is also possible to force out the detail that is sluggish in making its appearance. While these facts exist and cannot be refuted, it is surely incorrect to say that the control possessed by the operator over an exposed plate lies entirely in the degree of density which the negative can be given.

Repeating the statement already made, it is obvious that chemicals cannot in any way supplement the action of the light; but once the light has exerted that mysterious influence over the plate which enables the developer to act, common sense suggests and practical experience confirms the opinion that some one of the various forms of developers will be suitable for the work when the duration of the exposure is duly considered. Or by merely varying the quantities of their constituents the way in which they act can be so completely changed that different results ensue, and a certain amount of control can be exercised in this way. In other words, a developer can be mixed that will only act within a reasonable time upon a plate that for another form of developer would be so much over-exposed that only a fogged plate would almost instantly result from its use. It also follows that in the case of a supposed under-exposure, this may only happen when a certain standard of developer is taken into account; it does not therefore necessarily follow that for one having a more energetic action there would exist any under-exposure.

If the light has not acted on the plate to a certain extent, no chemicals can be made to do their necessary work in the manner required, but if the light has once been admitted to the plate with any degree of intensity, then it is almost certain that there does exist some form of developer which will enable the operator to bring out the latent image. Practical knowledge, therefore, is required in the developing room, as it is everywhere else, before skilled work can be accomplished. The means whereby apparent difficulties can be overcome is always worth knowing, and the beginner is strongly advised to make when it is possible some experiments with the various forms of developers which are now in use by photographers, also to note the results ensuing from changing the proportions of the ingredients in their composition. A few experiments of this sort will be far more satisfactory than any amount of second-hand information or the adoption of plausible theories. It is not absolutely necessary for a young photographer to take up the study of chemistry in order to acquire proficiency in the art of development, nevertheless it is advisable for him to acquire some information regarding the nature of a few simple chemicals to whose use he will have to resort. It is distinctly necessary, however, for him to learn as soon as possible the functions these chemicals fulfil, and the reasons that their addition to the developer is required, and in connection with this subject he should take note of the proportionate quantities, in relation one to the other, which are necessary for them to act conjointly with what may be called the unity of vigour.

The chemical side of photography is the one that supplies apparently more hopeless obstacles for the tyro to overcome than any other of its manifold phases. But in reality there should be no difficulty for any one possessed of the average amount of intelligence and a desire to acquire all the information necessary for his work with the camera, for with a very short application of his faculties to the subject he will find in all probability that his difficulties have disappeared and that this special feature of the photographic art is in reality its most fascinating side. The class of men who send their plates to be developed and printed by some one in the business lose the greatest pleasure which photography can confer. The mere focussing a picture and subsequent exposure of the plate cannot possibly excite the same intellectual pleasure that the process of development, the forcing of its hidden secrets from the surface of the plate, can be made to yield when the work is recognised as one calling for the use of brains and skill, or at any rate is not considered to be a purely mechanical operation with its hit or miss style of procedure.

To the subject of the chemicals required and their use in the developer we purpose making some reference in the ensuing article.

## The Lantern Society.

### PHOTOGRAPHY AS APPLIED TO ASTRONOMY.

At the meeting held on March 9th, Mr. E. W. Maunder commenced by dealing with solar photography, the sun having, he said, been the first celestial object which was photographed for scientific purposes. Soon after the discovery of the daguerreotype process, photographs were taken of the moon and also of some stellar groups, but these views did not serve any scientific purpose, and it is from the systematic use of the photo-heliograph for obtaining a photographic record of the state of the solar surface that the application of photography to astronomical purposes may be said to date. Mr. Maunder next spoke of the first photo-heliograph erected at Kew, and described in detail the later instrument now used at Greenwich, the work done by the

instrument being illustrated by a series of slides showing portions of the solar surface. Other views were also exhibited prepared from the beautiful photographs taken by M. Janssen at Meudon, these being, as Mr. Maunder remarked, the finest solar photographs yet produced, showing as they do most admirably the structure of the surface of the sun, the faculae, etc. While dealing with solar photography, Mr. Maunder also pointed out the strong grounds for connecting the period of maximum solar disturbance, as marked by the frequency and extent of sun-spots, with terrestrial magnetic disturbances, and he further alluded to the manner in which the periods of maxima and minima were marked by variations in the latitude of the spots occurring.

The next portion of the subject treated was the application of photography to the observation of total solar eclipses, the instruments used being described, and a number of photographs shown illustrating the structure of the corona as seen at recent eclipses.

Leaving the sun, Mr. Maunder next proceeded to treat of the photographing of the planets, illustrating his remarks by slides of Jupiter and Saturn taken at the Lick Observatory, and by Professor Pickering, of Harvard. The task of photographing a planet was, he remarked, one of great difficulty, inasmuch as the very moderate light available did not admit of instantaneous exposures, such as sufficed in the case of the sun, while the rapid rotations of Jupiter and Saturn on their axes prevented recourse being had to the long exposures which could be employed when photographing fixed stars. Altogether, up to the present time, although remarkable progress has been made, photographs of the planets left much to be desired, and could not compare favourably with the records obtained by skilful draughtsmen. In illustration of this there were thrown upon the screen reproductions of a number of the best drawings of the planets of which direct photographs had been shown.

Dealing next with stellar photography and photographs of nebulae, Mr. Maunder remarked that in these departments photography left all records founded on visual observations far behind. In fact, the details of structure of nebulae, as shown by the magnificent photographs of Common and Roberts, had been a complete revelation, and had resulted in an extension of our knowledge of such bodies, the value of which it was difficult to over-estimate. For comparison there were shown on the screen photographs of the Orion Nebula and the great Nebula of Andromeda, and reproductions of the best drawings available prior to the production of these photographs.

In dealing with stellar photography, Mr. Maunder paid a well-merited tribute to Dr. Gill, of the Royal Observatory at Cape-town, whose photographic survey of the southern hemisphere, carried out largely at his own cost, and now practically completed, may be fairly said to have originated the scheme for the general photographic survey of the heavens determined upon by the International Congress, and the arrangements for which are now in an advanced stage. In treating of these matters Mr. Maunder spoke at length on the admirable work done by Messrs. Paul and Prosper Henry, of the Paris Observatory, his remarks being illustrated by a large number of lantern slides showing the instruments used, photographs of the Pleiades, a portion of the constellation Cygnus, etc.

In conclusion, Mr. Maunder dealt with the applications of photography to solar and stellar spectroscopy research, there being exhibited on the screen the wonderful photographs obtained by Mr. Higgs from the red end of the spectrum, and examples of the spectra obtained by Professor Pickering from stars, the duplicity of which had been revealed by the spectroscope, the spectra obtained on some days showing the duplication of the lines due to movements of the stars in the direction of the line of sight. This duplication of the lines showed that the spectrum in which it occurred was compounded of the light from two stars moving at different velocities with regard to the line of sight, and by collating the observations at different dates it was possible to calculate the periods of revolution and the masses of two stars which had never been separated visually by any telescope yet made, and probably never would be.

At the next meeting of the Lantern Society, on March 23rd, the slides sent to England by the American Lantern Slide Interchange will be exhibited.

**Quarterly Examinations.**—Mr. Clement J. Leaper writes:—"I must again congratulate you on your capital plan of giving your question-box competitors some *practical* work to do, in order to test their abilities."

## Exhibitions.

### LIVERPOOL INTERNATIONAL PHOTOGRAPHIES.

No. II.

(By Our Special Correspondent.)

By the time this issue of the AMATEUR PHOTOGRAPHER sees the light, somewhere about 10,000 people will have passed through the turnstiles of the Liverpool Exhibition. This is putting the attendance at a medium figure, which in all probability will be exceeded. Such unequivocal success was scarcely anticipated by even the most sanguine of those interested in the scheme, and has certainly far surpassed the calculations of the more sober and pessimistic. The photographic Press as a whole, and the local Press generally, have materially assisted to this grand result, the journalistic notices of the show having been uniformly flattering.

#### LIME-LIGHT DEMONSTRATIONS.

So far as the attendances at the nightly lime-light demonstrations and lectures are concerned, they also have been highly satisfactory; notwithstanding that two demonstrations, each lasting from one and a quarter to one and three-quarters of an hour, are given every night, the audiences average from 500 to 300. Perhaps the most novel and popular of these "side shows" has been Mr. Paul Lange's "Iceland," which, given for the first time in public last Friday, elicited from a large, fashionable, and critical audience many volleys of rapturous applause. When it is said that immediately the lecturer concluded Mr. Lange was swamped in a crowd of congratulatory fellow photographers, the quality and effect of the demonstration will be better understood. In a series of nearly 120 really first-class slides, those depicting experiences in the fording of rivers, the sulphur springs at Krisuvick, the geysers, cloud effects, the crater of Hecla, the "midnight sun," the "Golden" Waterfall, interior of an Icelandic homestead, the Almanagja, and a hurricane off the Faroe Islands may be singled out for special mention. The examples of the natural colourisation of the island, from the purple black of the lava to the rich blue of boiling cauldrons and the brilliant yellow of the sunshine, were a revelation, attesting the skill of the operator in every detail. Among the other lecturers who have delighted their hearers during the past week are Mr. John Hargreaves, "The Hundred of Wirral;" Mr. Geo. Thompson, "Florence, Past and Present" (a new demonstration of great value); Mr. Fred Clibborn, "Italian Highways and Byeways;" Mr. C. W. Hastings, "Prize Sets in AMATEUR PHOTOGRAPHER Competitions;" Mr. J. W. Wade, "Hand-Camera Work;" Mr. Thomas Brownrigg, "Foreign and Home Scenery and Antiquities;" Mr. W. Lamond Howie, "To Ober-Ammergau and Back in 1890;" Mr. A. F. Stanistreet, "The White Mountains of New Hampshire;" Mr. Robert Bailly Wilson, "Picturesque New Zealand;" Mr. Paul Lange, "Norway" and "Picturesque Scotland." To-night (Friday) the lecturers are Mr. A. R. Dresser, "Uses of Hand-Camera Slides;" Mr. Christopher Naylor, "A Tour Round the World;" and on Saturday Mr. Paul Lange's "Iceland" and Mr. Fred Clibborn's "Up and Down North Holland."

#### MORE OF THE PICTURES.

Undoubtedly, the exhibition grows on one with successive visits; and this is so both in regard to the large number of good pictures and the all-round excellence of the show. You may walk carefully round the galleries a dozen times and always find something new. Let us take the classes consecutively, beginning at Class I., portraits 10 by 8 in. and over; any process; set of four pictures. The numbers range from 1 to 72, the collection representing the work of eighteen amateurs and professional firms. Nos. 1 to 4 (Marius and Vivash) are good, as are 5 to 8 by Mr. Geo. Latimer, a member of the Walton Society. Mr. W. Crooke's 13 to 16, especially No. 13 "Well by his Visage," are very excellent, and were awarded the silver medal, which, however, had to be withdrawn, as the picture had been previously exhibited. Next, 25 to 28 (R. W. Robinson), portraits of children, are exceptionally fine and nearly secured the award. In fact, Mr. Robinson was unlucky not to get it. Barraud's show very good studies in 45 to 48, as does Mr. W. Barry in 49 to 52. Mr. T. H. Flather (53 to 56), has four clever pictures (dry point needle process), and Mr. H. McMichael is prominent with a unique set, 61 to 64; pose and general effect very fine, especially in No. 64. Mr. Harold Baker's (bronze medal) 65 to 68 are capital, and Vandyke's (silver

medal) 69 to 72 unusually good. In 72 (a) Mr. A. Von Mumm, of Washington, U. S. A., has a splendid study. Another well-liked exhibit is Window and Groves' No. 29, of 29 to 32. Mr. W. J. Byrne's 57 to 60 are also very creditable.

Class II.—portraits,  $8\frac{1}{2}$  in. by  $6\frac{1}{2}$  in. and under, any process; set of four pictures—is made up of some twenty frames (73 to 89), representing eleven workers. No. 75, cabinet photographs by Mr. W. W. Winter, should, in the opinion of many critics, have received a medal. Certainly they are very high class. Of Mr. W. J. Byrne's 82 to 85, 85 is decidedly the better picture.

In Class III.—portraits, platinotype or other matt-surface prints; set of four pictures—Messrs. Window and Grove get the bronze medal with No. 91, a very excellent frame. Nos. 95 to 98, Mr. W. J. Byrne, are favourites. Six exhibitors compete in this class; nine frames, 90 to 98.

Class IV.—portraits (bust or head only, direct only), direct, untouched, any size or process; set of four pictures—comprises 99 to 109, to which five workers contribute. Mr. W. J. Byrne takes the bronze medal with 106 to 109.

The combined portrait classes embrace Nos. 1 to 109, which represent the work of about thirty exhibitors: four foreign—Frederick Baron de Brentano, Hanover; Gaston Plessy, France; Premier Lieut. Bohmer, Gleiwitz, Germany; and George Alpers, jun., Hanover. On the whole, these foreign exhibits are very fair.

There are five landscape classes (V. to IX. inclusive), the numbers ranging from 110 to 401, and including the exhibits of about 120 competitors: fourteen foreign—Joseph Scholefield, Nurnberg, Germany; Hauser J. Menet, Madrid; Johann Pasquali von Campostellato, Austria; J. Martiny, Belgium; Premier Lieut. Bohmer, Germany; M. de Déchy, Odessa; Baron de Brentano, Hanover; Countess Loredana da Porto Bonin, Vicenza, Italy; Gaston Plessy, France; Thomas Zacharias, Germany; Breitinger-Wyder, Zurich, Switzerland; George Alpers, jun., Hanover; Manuel de Soto, Zurich; and Joseph Chmielewski, Poltana, Russia. There are also one or two exhibits from the United States and the colonies. Individual studies, and the work, as a whole, reaches a very high point of excellence indeed.

Class V.—landscapes, whole-plate and over, platinotype or other matt-surface prints; set of four pictures—is the most numerous section of the landscape classes, extending from Nos. 110 to 237. Over thirty workers are represented. Nos. 118 to 121, Scenes in Iceland, by Dr. John Reynolds, are novel, and evince much care and ability. No. 111 of F. M. Sutcliffe's 110 to 113 is distinctly the better picture, though the quartette are good. Then come 142 to 145 (bronze medal), by E. Lloyd Edwards, of which No. 143 is the best and more prominent; No. 150, in 150 to 153, by C. H. Miller; 154 to 157, R. W. Robinson; and 166 to 169, by Hauser J. Menet. The latter set have a pleasing green tone, and the detail is exceptionally good. A. Hendry shows up to advantage with 174 to 177, and F. D'Arces takes a bronze medal with 178 to 191, No. 179 being the finest. Nos. 186 to 189, by Ernest Gladstone, show a variation, Nos. 186 and 187 being far superior to the other two. James Pennington's 202 to 205, Cyril S. Cobb's 206 to 209, William Bedford's 210 to 213, T. M. Brownrigg's 218 to 221, and E. M. Tunstall's 226 to 229 are excellent, and a quartette of Hoar-Frost Scenes, S. G. Buchanan Wollaston's 230 to 233, uncommonly fine. M. de Déchy's 234 to 237 are fair. Mr. Wollaston's best picture is No. 233. Johann Pasquali von Campostellato contributes 222 to 225, a rather mixed four, of which 222 and 225 are the pick. Mr. Cobb would have increased his chances for a medal had he got a better colour in his set.

Passing Nos. 242 to 245, by Chas. A. Timmins, No. 242 being a very creditable picture—in Class VI. the first studies of note are No. 247, by Mrs. Janie W. Hignett, and then No. 249, Sidney Snelgrove, a set which would in all probability have taken an award only that the clouds are too heavy. S. Bourne's 251 of 251 to 254 is the better, and Henry Lupton has a pleasing four in No. 257—three scenes in Teesdale and one at Bettws-y-Coed. W. P. Shaw, No. 262, exhibits a nice set, as does Arnold J. Cleaver in 264 to 267. William Tomkinson (silver medal), 268 to 271, shows his two best pictures in "Sheep Washing" (269) and "Peel Castle" (270). Both these studies specially mentioned are first-class. M. de Déchy, in No. 275 of 272 to 275, shows an AMATEUR PHOTOGRAPHER medal picture. Class VI. ranges from 238 to 275, and is contributed to by twenty exhibitors. Conditions: Landscapes, 8 in. by 5 in. and under; platinotype or other matt-surface prints, set of four pictures.

Contributors to Class VII., Nos. 276 to 326, number thirteen. The competition is for landscapes, whole-plate and over, silver prints, including Obernetter and Aristotype, set of four pictures. In this class there are three foreign and one American competitors, including the now famous Countess Loredana da Porto Bonin, the Italian gold medal winner in the flash-light section. She is represented in Class VII. by 319 to 322 ("Love," "Reflection," "Repose," and "At the Wells"), four very fine works. John Kennedy exhibits 276 to 279, George Latimer 280 to 283, J. Milman Brown 287 to 290, of which Nos. 289 and 290 are the choice; J. H. Tarbell (U.S.A.) 300 to 302, and F. H. Glazebrook 307 to 310.

In Class VIII., Nos. 327 to 380—for landscapes, 8 in. by 5 in. and under, silver prints, including Obernetter and Aristotype, set of four pictures—there are thirty-nine competitors, several of whom hail from the colonies and abroad. Karl Greger's "Mountain Solitudes in the Tyrol" (329) is a lovely exhibit, the toning being remarkably fine. This competitor secures a silver medal for instantaneous work. No. 332, by Thomas Zacharias, gets the bronze medal, and then follow 333, by Jas. Alex. Forrest; 334, by A. H. Hignett; 353, by A. F. Stanistreet; 354, by J. Lamond Howie; 377, by J. L. Mackrell; and 379, by William Tomkinson. All these sets are admirable. In 343 T. B. Sutton shows very fair work, so does A. Bradbury in 368, and in 378 Walter Pollard has a set conspicuous for their general neatness.

Twenty-one exhibitors make up Class IX., the last of the Landscape Classes, 381 to 401, any size, any process, introducing important figure studies, which may be made to tell a story or illustrate a poem or poetic thought, one picture only; may be a combination print. No medal was awarded in this class. However, Fred Anyon is very much to the fore with No. 384, a capital study, "Is Life Worth Living?" Other good pictures are 382, Thomas Glazebrook; 383, Frank R. Sutcliffe; 386, Joseph Chmielewski; 389, Mrs. Janie D. Hignett; and 401, Countess Loredana da Porto Bonin.

#### THE STEREO TRANSPARENCIES.

Turning from the "print" exhibits until next week, and reviewing the stereoscopic transparencies and lantern slides, it may be at once stated that they are a superb collection. Commencing at Class XVII. they conclude at Class XXI., exclusive of several exquisite sets "not for competition." Altogether, the competitive display numbers within one or two of fifty sets, and represents the work of many masters in these delightful branches of photography.

In Class XVIII., 721 to 727, stereoscopic transparencies (set of six), H. J. Houghton carries the silver medal away with No. 726, each of the slides being a capital specimen. Arthur F. Stanistreet is equally deserving of a silver honour with 721, but apparently home studies are not quite so novel or so well appreciated as those made abroad. H. J. Houghton's set includes 1, 2, and 3, Chirk; 4, 5, and 6, Obersdorf, Bavaria. A. F. Stanistreet's half-dozen are local studies, a particularly brilliant one being the "Long Corridor, Eaton Hall." H. G. Ridgway, 722, has six beautiful scenes of Dovedale and other picturesque spots; and other exceedingly good work is shown by T. S. Mayne, 727; Alex. Hamilton, 723; and J. E. Ellam, 724.

#### SOME OF THE LANTERN SLIDES.

Class XIX., Nos. 721 to 727— $3\frac{1}{4}$  in. by  $3\frac{1}{4}$  in.; town or country life, landscape or general work; set of six—is composed of slides by some thirty workers. George E. Thompson takes the silver medal with set No. 745, really magnificent slides. Among this half-dozen, one slide in particular, "A Gipsy Camp," is marvelous, or, to quote the opinion of acknowledged judges, "the finest lantern slide we have ever seen." John Carpenter, 734, was awarded a special bronze medal for six charming flower studies, the gradations being shown in masterly style. Fred. Anyon is another bronze-medal winner with 751, a fine set. Other very excellent work is shown by Miss Rose Collier, 733; Edgar G. Lee, 728; Walter Ballard, 729; T. B. Sutton, 735; Chas. A. Timmins, 740; Chas. Reid, 736, a splendid set of animal groups; Alfred Tyrer, 743; James Dore, 752; E. M. Tunstall, 755; and Richard Crowe, 756. Mr. Carpenter's flower studies are taken on isochromatic plates. One of Mr. Pollard's slides, "The Setting Sun," Sanghall Massey, is especially to be commended.

Class XX. contains five sets, Mr. W. L. Howie being successful with No. 757, six magnificent specimens of architecture. The

other exhibitors are Geo. E. Thompson, 759; Richard Crowe, 760 (a); J. Davenport, 760; and Henry Sharrock, 738. Conditions:  $3\frac{1}{2}$  in. by  $3\frac{1}{2}$  in.; architecture, interior or exterior; set of six.

Class XXI. is important, though not so large as XIX. It embraces sea scenes, waves, and cloud studies. Messrs. Priestley and Sons, a local firm, are awarded the silver medal for No. 771 set, six splendid slides, including a grand wave study. A charming softness in the skies considerably enhances the value of this exhibit. Two bronze medal winners in the same class are J. W. Wade, 765, and Fred Anyon, 767. Both sets are of very high merit. John W. Swinden's set, 768, Walter Pollard's 761, and G. West and Son's 774 are also very good and artistic.

Among the "Not for Competition" sets, Paul Lange's 749 is very prominent, as also are several other contributions.

#### APPARATUS, ETC.

In my next article I propose, in addition to dealing with more of the pictures, to commence a review of the apparatus at the Exhibition. There are some of the latest and finest photographic instruments and many novelties to be touched upon.

#### MR. ALFRED PARSONS' "GARDENS AND ORCHARDS."

By "LOITERER."

"Men o' genius," said Schopenhauer, "stand to the rest of the world like a schoolmaster towards his charges." This being granted, one may express the idea that the artist should stand to the rest of the world, if not as a discoverer, at least as a revealer of that which the world often passes by. In this exhibition at the Fine Art Society's rooms, Mr. Alfred Parsons, R.I., depicts in the most congenial fashion quaint orchards and gardens about which "the aroma of the ages" hangs. This talented artist transports us, as in a game of "Post," from Holme Lacey to Bodenham, from Salisbury to Gravetye, and we seem to "feel the breath of the downs, soft blown o'er leagues of clover And cold grey stone." We see—

"A garden that boasts of some daffodils gold,  
A perfumed narcissus that's pale with the cold,  
A fair laurestina well laden with bloom,  
A hyacinth crimson escaped from its tomb."

Mr. Parsons is perhaps happiest in "The Kitchen Garden, Sutton Place" (9), which is the home of Mr. Frederic Harrison, the historian. His "White Lilies" (3) is graceful, and the contrast offered to the eye in "Some Peonies" (5) makes that picture very effective. The gorgeousness of the floral surroundings in "Shirley Poppies" (8) detracts a little from the otherwise excellent view. In "Daffodils and Plum Trees" (10), a pretty spot in Berkshire is depicted. What a daring purple hue one sees in "Grafting" (13)! But it is truthful, nevertheless. "The Light that Failed" (15) shows a lady attired in vivid crimson, reading (possibly, the very work by Rudyard Kipling which gives the title to the picture) in a shady retreat at Fladbury. We admire the care exhibited by Mr. Parsons in "Yuccas at Gravetye" (25). "A Charming Garden at Salisbury" (29), giving a peep at the Cathedral, will be universally praised. The colour of the grass is, perhaps, most true to nature as shown in "Lilies" (39). The detail and perspective in "A Terrace Wall, Shiplake Court," is wonderfully good. An oil-painting, "The Gay Garden" (45), almost fails by reason of its brilliance. The last picture on the walls, "Summer Flowers" (53), will give satisfaction. It shows a wild corner in "A Careless-ordered Garden" at Frome.

#### THE LATE CHAS. KEENE'S DRAWINGS.

By "LOITERER."

The exhibition at the Fine Art Society's rooms of the sketches by the late Charles Keene will probably prove to be the most popular of minor exhibitions. The sight of these drawings—most of which appeared in the pages of *Punch*—reminds one of the serious loss which British art sustained in the death of this great and genial artist. Perhaps his claim to fame will rest upon his presentment and momentary expressions in the features of faithful representatives of the middle class of society. It is interesting to recognise in "Sympathy" (15), 21, "A Foggy Day" (90), and "The Coming Exhibitions" (159) that the artist has been his own model. Mr. Keene was a genuine humourist; witness the sketch 60, which the following dialogue explains:—*Little Wife* (indignant; she had just let him in, 12.30 midnight): "I

can't understand why you gave me the slip to-day, you unmanly wretch!" *He*: "Sush 'a place, that Fish'riesh-Exsh'bish'l, my dear! Shimply couldn't find yer. Went 'Shiberia, 'n Shina—not there; Shpaine—not there; Life-boash; 'Freshmensh—(this seems to remind him)—Fish-deller ver' sheap—but makeshy' ulcom'ly shirshy!"

Mr. Keene was always happy in his "Scenes from Clerical Life." For examples of this see 11 and 56, where, to the question of the curate, "But, why do you object to having a hymn during the collection?" the rector replies, "Well, you see, I preach a good sermon, which I calculate should move the people to an average of half-a-crown each; but I find, during a long hymn, they seem to cool down, and it barely brings a shilling a head." In few cases did Mr. Keene's excursions into fashionable society reward his search for fit subjects for his pen. The "Philistine Visitor," in "Shocking" (18), is the best part of the sketch. Mr. Du Maurier would have made more of the lady addressing him. But when he depicted the "Tenants' Ball" (22) Mr. Keene was quite in his element. The conversation of which this picture is the subject was as follows:—*Mr. Algernon* (the young squire): "May I have the honour of a waltz with you, Mrs. M'Clusty?" *Mrs. M.* (of the Home Farm—a heavy weight): "Weth plee-sure, sir. Shall we 'op it or slide it, Mr. Ale-geron? I think we'd better slide—which is less fatiguing for the bulky!" A good specimen of the deceased artist's ability to sketch horses is to be seen in "Polo for the People" (32), while his caricatures of public men in "The Bicycle, 1879," are admirable. "Place aux Dames" (80) displays a most remarkable group of police-court personages, each of the faces being characteristic. Most people will be amused at "Thrift" (88), where a Highlander, who had struck his foot against a stone, exclaims, "Phewts! e-eh, what a ding ma puir buit wad a gotten if a'd had it on!" The delicate work in "A Foggy Day" (90) may surprise some who were not aware of Mr. Keene's varied ability. We conclude with one more selection out of 250 sketches, which are all amusing, which is as clever as it is natural. "The Honeymoon" (147) depicts *Wife* (after a little tiff): "But you love me, dear" (sniff) "still?" *Husband* (cross old thing): "Oh, lor', yes; the stiller the better!"

#### ROYAL SOCIETY OF PAINTER-ETCHERS.

As many exhibits as there are days in the year, and with as varied a character as the weather we usually experience on them, may be seen at the ninth Annual Exhibition of the Royal Society of Painter-Etchers, in its Gallery, 5A, Pall Mall East. The President's ideal of the work of the Society is realised to a greater extent than heretofore. This is "the re-infusion into all forms of engravers' work, of those personal qualities which, whatever the process employed, in the hands of the great masters of painting made engraving a fine art."

An interesting etching is "Cheyne Walk, Chelsea," by Mr. C. J. Watson (2), which would be an appropriate neighbour to Mr. W. W. Burgess's "Old Chelsea Houses—Carlyle's, Rossetti's, and 'George Eliot's'" (64). Mr. Fred Slocombe is excellent in "Byfield" (10) and in "Going Home" (45), where the winding road and trees make a capital landscape. All Mr. David Law's work deserves praise, especially his "Ludlow Castle" (16). Mr. Percy Robertson's "Winchester" (29) must not be forgotten. Of course, Mr. Herbert Dicksee is happy with his animal subjects. His study of a "A Drinking Lion" (112) would delight Sir Wilfrid Lawson, for, though the king of the forest is usually to be seen at bars, in this case his cooling draught is water. Mr. Dicksee sends also a careful etching of a tigress (171), depicted with an open mouth, which gives rise to a suggestion as to its suitability for the front of an automatic supply machine for match-boxes. The etcher who sends the most striking series of exhibits is Mr. William Strang, whose industry as well as versatility is shown by the eighteen specimens of his work. "Charon" (125) bears a resemblance to that old friend whose forelock we are instructed to take. "The Tower" (181) is rather woolly, but "The Schoolmaster" (92) deserves warm congratulation. Mr. Strang also excels in the delineation of gaunt despair in the "Castaways" (67). Mr. C. F. Allbon sends a pretty etching of "Tamise on the Scheldt" (38). Mr. G. P. Jacobm-Hood's "Head of a Woman" (40) shows all his usual skill, as also in the graceful frontispiece to Mr. Andrew Lang's "Aucassin and Nicolette" (248). Mr. A. W. Strutt was fortunate in his model for "The King's Pillow" (42). All Mr.

Axel H. Haig's work testifies to the care with which he has studied his art—witness "Arab Students, Cairo" (46), and "In the Arab Quarters, Cairo" (154). The view of St. Paul's which Mr. Francis S. Walker selected (48) was well chosen, and repays his painstaking study. Mr. Edward Slocombe is responsible for a good etching of "Maison des Bateliers, Ghent" (58), and is happy in "Old Elvet Bridge, Durham" (99). The Countess Feodora Gleichen sends an unpretentious etching "Music" (59). We like Mr. A. W. Bayes' "Borley Mill" (71). Mr. Charles Holroyd's "Death of Icarus" (76) is powerful. Mr. W. Boucher has been very lucky in "Old Folks at Home" (80), the models representing a veritable Darby and Joan, we should imagine. Mr. W. Holmes May sends an extremely good etching of a Welsh bridge (95) with an unpronounceable name. The soft texture attained by Mr. Percy Thomas in his "Fen Mill" (98) is worthy of a better subject. Mr. Charles H. Shannon has two fine specimens of his artistic skill in "Master Hargood" (101), and a mezzotint "Summer" (240). That was a happy selection which Mr. Herbert Marshall, R.W.S., made for his etching of brainland as "Fleet Street" (107) has been termed. Commendation must be awarded to Mr. W. Holmes May for "Through the Wood" (116); to Mr. R. Goff for his admirable "Sussex Downs" (121); and to Mr. C. F. Robinson for "The Fairy Glen" (143), which has been considered one of the prettiest etchings in the exhibition. All Mr. John Finnie's work shows his well-known style at its best; vide "A Lone Shore" (130), "Margin of Rydal" (172), and "Sunset" (237). Mr. T. C. Farrer has an excellent mezzotint entitled "The Return of the Flock" (168). Mr. Charles O. Murray is represented well by "Interior of Aldbury Vicarage" (189), where he has triumphed over the difficulties of light in admirable style. He shows care in "Pansies and Lilies of the Valley" (210). "The Marriage Door, Nuremberg" (251) is a fine piece of work by Mr. F. Inigo Thomas, who must have devoted much loving study to his subject. The plates of the *Liber Studiorum*, which were either executed by Turner himself or under his supervision, are also to be seen at this exhibition, having been generously lent by the Rev. Stopford A. Brooke, Mr. James Knowles, Mr. W. G. Rawlinson, Mr. F. Stevenson, and Mr. J. E. Taylor.

## Notes from the Liverpool Centre.

(By our District Editor.)

I THINK I have previously stated in this column that the ordinary monthly meeting of the Liverpool Association will not be held this month, owing to the advent of the exhibition. The series of practical demonstrations is also interrupted for the time being from the same cause, but the Wednesday coffee meetings—which, by the way, are an important feature of the Society—and other work are being conducted as usual.

In other societies connected with this centre, business is brisk. Meetings held during the month of March are:—

Bolton Camera Club—March 11th, "Chemistry of Photography," by Dr. Mackenzie; Members' Work, March 25th.

Blackburn and District Photographic Society—March 26th, Lantern Evening.

Bolton Photographic Society—March 5th, Opening of New Rooms.

Burnley Photographic Society—"Micro-Photography," March 25th.

Bury Photographic and Art Club—"Enlarging by the Lantern," Mr. R. Grundy, March 18th.

Crewe Amateur Photographic Society—Exhibition of Work and Slides, March 25th.

Lancaster Photographic Society—Lantern Evening, AMATEUR PHOTOGRAPHER No. 1 Monthly Slides, March 31st.

Liverpool Y.M.C.A. Camera Club—Monthly Meeting, March 4th.

Oldham Photographic Society—"Holidays in the Riviera," by Mr. T. Widdop, March 27th.

Southport Photographic Society—"Lantern Slide Making by Reduction," March 3rd.

Wallasey Photographic Association—"Lantern Exhibition," by Mr. D. Kendall, March 4th.

Walton Photographic Society—Annual Meeting, March 4th.

Wigan Photographic Society—"Lantern Slides by Reduction," by the President, the Rev. G. F. Wills, M.A. Ordinary Meeting, March 19th.

It has been decided to hold the ordinary meetings of the

recently formed Liverpool Camera Club on the second Wednesday in each month, in the rooms of the Liverpool College, Shaw Street. There is no entrance fee for members joining during the present year; the annual subscription is exceedingly low, 5s. The executive are Mr. Cecil F. Webb, B.A., L.D.S., President; Mr. James Hawkins, Vice-President; Mr. W. Tansley, Secretary; and Messrs. R. C. Robbins, F. W. S. Burslem, W. H. Glassey, W. H. Jones, and W. A. Brown, Council. Mr. Tansley writes me to the effect that the first meeting of the Society was held on Wednesday, 11th inst. Mr. Webb, on taking the chair, gave an interesting address on "Photography, its various Relations, and the number of Practical Uses to which it is now applied." A limelight exhibition of the work of several members followed. The meeting was earnest and unanimous, from which it is anticipated that the new club will speedily become a success.

Readers of the AMATEUR PHOTOGRAPHER will peruse the following from the *Liverpool Review* of last Saturday's date with interest:—

"One of the most interesting figures at the opening ceremony of the Photographic Exhibition in the Walker Art Gallery, last Friday, was Mr. C. W. Hastings, Editor of the AMATEUR PHOTOGRAPHER, *Photographic Reporter*, *Photographic Quarterly*, and other high-class photographic journals. At the last Photographic Exhibition in Liverpool, in 1888, Mr. Hastings was the only representative of the photographic Press present. Since that time he has done splendid service to the rapidly increasing army of photographers. He has remarkable energy, any amount of 'go,' and is a whale for work."

## Apparatus.

### LANCASTER'S "OMNIGRAPH" HAND-CAMERA.

THIS camera consists of a light box covered with black leather, and constructed to carry six quarter-plates in a changing box, the using of which is extremely simple. A shutter is withdrawn and returned to its place, and the plate is ready for exposure; the box is turned round and the other shutter withdrawn and returned, and the exposed plate is then stored behind those which are unexposed. A good viewfinder is fitted to the front of the

camera, countersunk, and a small edition of Messrs. Lancaster's See-Saw shutter is placed on the front; it will give either time or instantaneous exposure. The whole is well made, and does every credit to the well-known character of the firm for careful workmanship. The price is one guinea.

### LANCASTER'S "ROVER" HAND-CAMERA.

In this camera the particular feature is the method in which the plates are stored in sheaths—in which they are held by a spring-

locking bar—in a reservoir at the top of the camera, whence they are allowed to descend successively by the operation of a lever at the side of the camera. On falling into the exposure chamber they are pressed against a rolling wood shutter, which secures their being in accurate register, and the withdrawal of the shutter allows the exposed plate to fall into a receptacle at

the back, which will hold the whole of the twelve plates the

camera is constructed to carry. The advantage of this method is that any plates which have been exposed can be taken away without any fear of taking the unexposed plates. A countersunk viewfinder is attached. This camera is made in any size, from lantern plate to  $7\frac{1}{2}$  by 5, it is light and compact, and the changing movement

is simplicity itself. The shutter is a See-Saw, which is worked by two small knobs, one of which gives a time, and the other an instantaneous exposure.

#### SHARP AND HITCHMOUGH'S "APTUS" PREMIER ENLARGING AND REDUCING CAMERA.

This camera is made of mahogany, French-polished, and finished, with rack and pinion adjustment, the rear portion forming the camera for a studio, which may have a repeating back for taking one or more negatives on the same plate; a swing-back is

FIG. 1.

also fitted when desired, also rising and cross fronts, which are easily removed when a change of lens is necessary. For the adjustment of the middle body when using the camera for enlarging and having it well extended, focussing arms are fitted so that the centre portion of the camera may be adjusted to its correct position before focussing; an entirely new arrangement for holding and manipulating the negative in any position while focussing on the ground-glass is fitted behind the diffusing screen and immediately in front of a nest of carriers for holding a negative of recognised size. This arrangement is a distinct advance upon

anything previously done in the way of holding negatives in position while enlarging, inasmuch as any portion of the plate may be centralised instantly while viewing the image on the ground-glass. The working parts of the camera are interchangeable, so that the lens may be mounted at the extreme end, when it is found necessary to copy or enlarge from very small and opaque objects. In designing the camera, the objects the makers had before them were (1) that

FIG. 2.

the camera should enlarge or reduce from any sizes, negative or positive, of course restricted only by the size of the camera; (2)

that every part should be interchangeable; (3) that the adjustment of the negative, while being held for enlarging, should be accomplished while focussing; (4) that daylight or artificial light, transmitted or reflected, should be used as desired; (5) that the camera shall be so arranged that it will answer all the purposes of a modern studio camera with a repeating back, and having rack and pinion adjustment, swing-back, vertical and horizontal movements to the front, etc. The apparatus seems to admirably fulfil these requirements.

## Societies' Meetings.

**NOTE.**—In this column the Editor can of necessity only give a brief summary of the proceedings. Papers read before societies will appear in the PHOTOGRAPHIC REPORTER, and the Editor of the REPORTER will be glad to receive reports for insertion as early as possible after the meetings have been held.

**Aldenharn Institution.**—The usual meeting was held on the 17th inst., when the members spent an exceedingly pleasant two hours in looking over the "Travelling Studentship" and "Instantaneous" competition prints kindly lent by the proprietors of the AMATEUR PHOTOGRAPHER.

**Ashton-under-Lyne.**—The recently formed Ashton-under-Lyne Photographic Society has already upwards of sixty members, and on Wednesday the President, Dr. Hamilton, gave a demonstration on "The Platinotype Process." The following were elected officers for the ensuing year:—President, Dr. A. Hamilton; Vice-Presidents, Major Bradley, J. W. Kenworthy, Rev. H. J. Palmer, C. E. Redfern; Committee, W. Chadwick, T. Glazebrook, W. Greenwood, B. Hall, W. Leigh, R. Matthews, A. Storey, G. Wild; Treasurer, R. T. Morsland; Hon. Secretary, George H. Dean, Crawford Terrace.

**Bradford.**—The monthly meeting was held on the 12th inst., when an instructive paper, with a demonstration, was given by Mr. J. Sonenthal, a member, on "A Few Hints on Platinotype Printing and Developing," after which a lantern exhibition was given of the slides sent in to the AMATEUR PHOTOGRAPHER's Monthly Competition No. 2, "Portraiture and Figure Study," many of which were much admired. The next meeting will be held on the 14th April, when the American slides will be shown.

**Brentwood.**—The Brentwood Cycling Club, which has lately formed a Photographic Section, held its annual general meeting on the 10th inst. After the close of the business a collection of photographs lent by the Editor of the AMATEUR PHOTOGRAPHER were exhibited. This is the first that have been seen in Brentwood, and it is thought, now that the members know up to what standard they must work, that increased interest will be taken in this section. A Photographic Committee, consisting of Mr. Leonard Brown (the Secretary of the club), Mr. A. J. Copeland, and Mr. Harry Wallis, was elected.

**Cardiff.**—On the 13th inst. Mr. J. Storrie, the Curator of the Cardiff Museum, gave the members a lecture on "Photo-Micrography." The lecture was very instructive, dealing with insect life, geology, and floral studies, and illustrated with numerous lantern-slides. We regret to learn the Society has recently sustained a severe loss by the death of Mr. D. Josty, one of its oldest and most energetic members. Mr. Josty was a student of the art from its infancy, and both the tyro and advanced pupil could always depend on gaining valuable information from his discourses. He was a most genial gentleman, and a particular favourite with the photographic community of Cardiff, both amateur and professional.

**Croydon Camera.**—At the fortnightly meeting on the 16th inst., the five following gentlemen were elected members: Messrs. Henry Larkin, H. B. Larkin, W. G. Fenn, H. Coombes, and J. Daniell. Mr. Isaac gave a lecture on "Lenses," illustrated by diagrams projected on the screen by means of the lantern. The lecturer's remarks were carefully followed, and an interesting discussion ensued. It was decided to hold a whole-day excursion to Shoreham on Easter Monday, and those desiring to accompany the party should apply to Mr. White. A number of slides were passed through the lantern by Messrs. Oakley, Neeves, Hirst, Corden, White, and others. The one which created chief interest was a reproduction from a flash-light taken at the dinner held on the 2nd inst. Preparation for the exhibition of members' work which opens on the 31st inst. are being pushed forward. Exhibits will be received at 96, George-street, from Monday 23rd to Saturday 28th. Wall's "Dictionary of Photography" was added to the library.

**Falkirk.**—The Hon. Secretary writes:—"We had a meeting on Wednesday last, the 11th inst., to arrange for this year's exhibition and competition, which will be held early in November. We are offering in all seven medals (two gold and five silver). We have three competitions, No. 1 being ordinary silver printing; No. 2, bro-

wide printing; and No. 3, enlargements. For No. 1 competition we offer one gold and two silver medals, the same being offered for No. 2, and one silver medal only for No. 3. We have also drawn out a syllabus for our summer's outing, and the most selected spots in Stirlingshire and Fifeshire have been fixed on. Our members are all doing very good work, and there will doubtless be a hard struggle for the prizes at the end of the season."

**Glasgow and West of Scotland.**—The usual meeting was held on the 16th inst.; five members were elected. Mr. J. W. McKenzie gave a description and demonstration of the parchment Collographic process, recently brought before the London societies by Mr. Warnerke. Mr. McKenzie produced a number of excellent prints, and the process was watched with keen interest by the members. Mr. Hugh Reid exhibited a camera fitted with a telescope as a focussing finder, and showed negatives of vessels in motion taken with the apparatus. The meeting closed with a show of lantern-slides, amongst which were ninety-five views in the Yellowstone Park, U.S.A.

**Haltwhistle.**—The ordinary monthly meeting was held on the 8th inst., the Vice-President in the chair. Dr. Speirs gave a practical demonstration on "Enlarging on Bromide Paper." He first of all mentioned the many advantages to the possessor of a small camera, over the owner of one of larger size—such as a considerable saving in the outlay for plates and chemicals; more portable, and consequently greater ease in the different manipulations. He touched on the best lenses and condensers for enlarging, and the different luminants used, finally describing the process of coating with emulsion, etc. He then exposed a half-plate negative in his ordinary camera, pointing the lens through a partition in the room specially made, and reflecting the view on to a drawing board. Using a lamp to focus by and burning twelve inches of magnesium wire behind the negative with a sheet of ground glass between to diffuse the light, a first-class enlargement of nearly five diameters was the result. He afterwards made an enlargement of seven diameters as an example of what to avoid, a point at which photographic enlargements, both technically and pictorially, cease to be pictures and become eyesores. The next meeting will be held on the 28th inst., when there will be a lantern exhibition.

**Hackney.**—The ordinary meeting was held on the 12th inst., when a paper and demonstration on "Bromide Enlarging" was read by Mr. S. H. Fry. Dr. Roland Smith presided. The Secretary issued circulars inviting members to send pictures for the forthcoming Palace Exhibition. It was announced that Messrs. Barton and Carpenter had again secured prizes, the latter gentleman obtaining one at the Liverpool Exhibition. Mr. Fry then gave his paper and demonstration. He prefaced his demonstration by explaining the best kind of lens to use, and the diaphragm, advising the use of as large an aperture as would be consistent with sharpness and atmospheric effect. For vignetting he made a hole in a card and obtained the vignetting effect by a rotary motion. If one part was not properly exposed it could be treated locally, or re-exposed by washing off the developer, and bearing in mind that the paper was only about one-third as sensitive as it was before. As a very good way to gauge exposure when in doubt, he said for a matter up to three minutes, he advocated the placing of a strip of paper across the exposure band, and giving a number of exposures right across, taking a record. Then, after development, the correct exposure could be decided on. The lecturer advised the use of plenty of safe orange light, and when judging the density it could best be done by looking through the paper. With respect to developers he preferred the ferrous oxalate at present, though eikonogen may eventually usurp the place. The lecturer said he had found the acid baths unnecessary, provided the developer was perfectly washed out of the paper, and, moreover, if acid was conveyed to the fixing bath, there was danger of a formation of deposit of sulphur. He advised the soaking of the paper prior to development in distilled water. Next meeting April 9th, "Hand-Cameras."

**Holborn.**—On the 13th inst. about thirty-five members were at the club-room to hear a demonstration by the Platinotype Company, who had promised to attend on this evening, but on Friday morning they wrote to say that owing to the short notice they would be unable to attend. The club federation scheme was then discussed at some length, after which two new members were elected. Prints of the flash-light groups taken at the exhibition were on view.

**Ireland.**—An ordinary meeting was held at 15, Dawson Street, on the 13th inst., Mr. H. Bewley, Vice-President, in the chair. A discussion on hand-cameras was opened by Mr. J. White, and a large number exhibited. Subsequently a number of lantern-slides were thrown upon the screen, being contributed by the following members, viz., Dr. Cosgrave, Messrs. M. Hedley, J. H. Hargrave, H. E. Ivatts, N. Colgan, and L. Meldon. Mr. Hedley very kindly presented the Society with the "Parvenu" flash-lamp for the use of the members.

**Kendal.**—The monthly meeting was held on the 11th inst., Mr. Isaac Braithwaite in the chair. After the transaction of business relating to the affairs of the section, Mr. Samuel Rhodes gave an

admirable lecture on "Focussing, etc." He explained at the outset that he had not been able to write out a paper, as he had originally intended, but gave almost lucid and graphic account, dwelling, firstly, on the position of the lens and stop; other kindred details, ground-glass, etc., followed, and finally touching on "Naturalism." This latter was productive of considerable discussion and great difference of opinion. At the next meeting hand-cameras are to be exhibited, and short papers read respecting them. Members possessing these instruments are requested to communicate with the Secretary.

**Leeds Y.M.C.A.**—The annual entertainment provided by the members of this club took place on the 10th inst., in the Shaftesbury Hall, South Parade. The President, Mr. Godfrey Bingley, was in the chair. Over 200 slides, the summer's work of some of the members, were shown upon the screen. They included many views taken in Yorkshire and the adjacent counties, as well as some of places in the south of England. The slides were the productions of Messrs. Emsley, Hawksworth, Waddington, Denham, Plews, Eastwood, Garbutt, Gaines, and the President. Those shown by Mr. Waddington comprised some very fine examples of instantaneous photography. Mr. Plews exhibited slides for which he secured a bronze medal in a competition, and the President's contributions included slides of landscapes for which he was recently awarded a gold medal. The lantern was operated by Mr. Garbutt to the satisfaction of all. There was a numerous attendance.

**Leicester.**—A meeting was held on the 11th inst., Mr. J. Porritt in the chair. The ballot was taken for one member, who was unanimously elected, and one gentleman was proposed and seconded for ballot at next meeting. A communication was read by the Hon. Secretary from the Midland Railway, in response to an application from this society for reduced fares for members when travelling on photographic journeys, to the effect that having considered the question, the management do not see their way to grant the request. It was resolved that this society place itself in communication with the secretaries of various neighbouring societies with a view of forming an association for obtaining facilities in this direction. Mr. Geo. Bankart then gave a demonstration on "Autotype or Carbon Printing." Having prefaced the demonstration with a short but precise description of the principles of the process, and the various results from different conditions of exposure and heat in development, he proceeded to develop two 11 by 9 pictures printed on the Autotype Co.'s tissue, and the various stages of development from squeegeeing on to opal to the finishing of the process by development of the picture by hot water, was eagerly watched by a throng of interested listeners, to most of whom the process was entirely novel. The demonstration was a perfect success, both processes yielding fully-developed pictures, proving the immense value of the branch of the art. It was announced that at the April meeting Mr. Porritt would read a paper on "Photography, Past and Present."—By the invitation of Mr. F. G. Pierpoint, Vice-President, a large gathering of the members and their friends took place at the Temperance Hall on the 12th inst., when a most enjoyable entertainment was given in illustration of the high standard of excellence attained in the art of photography and also of the really admirable work which has been accomplished by members of the Society. Mr. J. T. Cook, the President, who acted as Chairman for the evening, remarked, in introducing Mr. Pierpoint to the audience, that the meeting was the first held in that hall in connection with the Society, which was started a few years ago for the purpose of developing a taste for photography. The first part of the programme consisted of a number of photographic views, mostly the work of Mr. Pierpoint himself, of places in "our own country," which were thrown upon the screen by the aid of the lantern referred to. In the concluding portion of the entertainment Mr. Pierpoint "personally conducted" his numerous audience to different countries of Europe, and also to Palestine and India, to Norway, Rome, the Riviera, Spain, and the Holy Land. The entertainment was brought to a close with a flying visit to Paris and a view of the Eiffel Tower at night, with special effects. A number of vocal selections, arranged by Mr. W. F. Quinn, were rendered at appropriate intervals. Mr. Charles W. Hastings, the Editor of the AMATEUR PHOTOGRAPHER, was present, and at the close of Mr. Pierpoint's lecture addressed a few words of encouragement to the workers in photography that were present, calling special attention to the excellent work done by their immediate past President, Mr. G. Bankart. The entertainment was a most creditable one and highly appreciated.

**Liverpool.**—On the 11th inst., in the Walker Art Gallery, two lime-light demonstrations were given to the members of the Amateur Photographic Society, the first at eight o'clock by Mr. Charles W. Hastings, Editor of the AMATEUR PHOTOGRAPHER, etc., and the second by Mr. John Hargreaves. Both gentlemen had full and highly-appreciative audiences. Mr. Hastings' demonstration took the form of an exhibition of the prize sets of lantern slides sent in to various competitions organised by the AMATEUR PHOTOGRAPHER. Most of the pictures were of the very finest quality, and frequently elicited enthusiastic applause. Mr. Hastings described the different

sets in a racy manner, which added considerably to the enjoyment of the lecture. Mr. Hargreaves is known to Liverpool audiences as a most humorous lecturer, and his demonstration, "The Hundred of Wirral," is also familiar to a large number of people on this and the Cheshire side of the Mersey. Needless to say, the lecture was listened to with rapt attention. On the 12th inst. the lecture was entitled "The Sunny Coasts of France and Italy," which was delivered by Mr. G. E. Thompson, and 120 views taken by the lecturer were shown. The frontispiece was of a rich dark blue, and the great variety of colours of the various slides formed a pleasing feature of this set of views. The colours were all obtained by chemical means and not by hand painting, a process which Mr. Thompson does not hold with in lantern photographs. Many scenes of interest were shown between Marseilles and Genoa, not the least so the admirable views of Monaco and Monte Carlo, well seconded by the telling little history of the principality which accompanied them. There were earthquake scenes in San Remo and Diano Marina, carnival scenes in Nice, grand mountains around Mentone, an effective night sky at Bordighera, and so on to Genoa. Some of the gems were reserved till the last. The second lecture was a repetition of the AMATEUR PHOTOGRAPHER competition slides. This exhibit is certainly most interesting. A slight novelty was introduced during the day of a regular musical afternoon from three to five, which will be repeated each day.

**Liverpool Camera Club.**—The first meeting of this new Society was held at the Liverpool College, Shaw Street, on the 11th inst. Mr. Cecil F. Webb (President), on taking the chair, gave a most interesting address to the members and friends present, taking for his subject photography in its various aspects, and the numerous uses to which it has hitherto been practically applied. This was followed by the exhibition of an extensive collection of varied slides taken during the past season, and passed through the lime-light lantern with admirable effect, under the careful manipulation of Mr. W. Anderson Brown. A most enjoyable evening was spent. The Liverpool Camera Club is likely to become a success, the names of a number of gentlemen desirous of membership being already before the Hon. Secretary, Mr. W. Tansley, 14, Wentworth Street, who will be pleased to furnish further particulars on application.

**Louth.**—The members of the above Society held their last lantern night of the season in the drawing-room of the Hon. Secretary, Mr. S. Francis Clarke, on the 9th inst., Captain Ranshaw, the President, in the chair. About 100 slides were submitted by members for exhibition. The whole of the slides proved of very fair average quality, while many of them were of exceptional beauty. A fine set by Mr. Clarence James, "It's you, Jack," "Over the Garden Wall," and a "Chip of the Old Block," proved great favourites. A fine group of sheep and some good slides of Croyland Abbey, by the Rev. J. M. Coates, were well received, and Mr. Coates is to be congratulated in possessing so good a selection of negatives of beautiful Croyland. Mr. Forman, jun., among the younger workers, sent in some very promising work. "Hallington Bridge" showed good taste in selecting the view, and fair manipulative skill in lantern-slide production. Mr. Burdett's set contained slides by both the wet and dry processes, the most notable, "The Old Stag Inn, Earls Barton," "The Eleanor Cross, Geddington," and a fine slide of the moon from a negative taken by himself, probably the first photograph of that luminary taken in this district. The slides by the Hon. Secretary contained several of his now well-known studies, "The First Quarrel," "What Love Hangs By," "Love's Young Dream," etc., and were fully appreciated by those present. To the only lady member exhibiting—Mrs. Clarke—was possibly due the greatest number of novelties, including "Dreaming," "Winter Gleaning," "Desolate," "Au Revoir," and "Hoarfrost," the two latter proving the gem slides of the evening. The Chairman announced that the next meeting of the Society will be on Monday, the 13th of April; subject, "New Members' Work."

**North Kent.**—A meeting was held on the 11th inst. A communication was read from the Meteorological Committee of the British Association, asking for copies of any photographs of interest on the subject. The proposed Photographic Institute now being founded by the Photographic Society of Great Britain was discussed. It was thought to be a necessary institution. The next meeting will be held on April 9th, when the "In and About Columbus" American slides will be shown.

**North Middlesex.**—At the meeting on the 9th inst., Mr. Goodhew in the chair, in the unavoidable absence of Mr. Friese Greene, who was to have addressed the Society upon "A New Sensitive Salt," the evening was devoted to society business. Mr. Goodhew reported proceedings taken at the meeting called by the President of the Toynbee Club re federation of societies. The question was discussed, and Messrs. Goodhew and Cherry were elected to represent the Society at future meetings, with full power to act. A field-day at Rickmansworth was arranged for Easter Monday.

**Oxford University.**—On the 27th ult. a well-attended meeting was held in the rooms of Mr. O. V. Darbishire (Balliol College), 95, High Street. Mr. Darbishire read an interesting paper on "Photo-

micrography," which was illustrated by a large amount of apparatus, diagrams, and prints. The paper was followed by a discussion in which many members joined. Mr. Darbishire explained many difficulties, and said he would be more than satisfied if his paper became the means of inducing even one member of the Club to take up this interesting branch of photography. A question-box was then started for the first time, and an instructive discussion followed on the questions which were asked. The following officers were elected for the summer term: President, Mr. H. W. Cave (Queen's); Treasurer, Mr. J. Walker, M.A. (Christ Church); Secretary, Mr. A. J. Clay (New College); Committee, Mr. R. G. Barnes (B.N.C.), and Mr. O. V. Darbishire (Balliol). On Monday, the 9th inst., the Club gave an open lantern evening. The Rev. W. H. Price, M.A., showed and described many beautiful slides of Switzerland and Italy. Many other members contributed slides, including the Rev. H. Bedford Pim, M.A., Mr. H. W. Cave, and Mr. Pennyfather.

**Photographic Society.**—At the meeting on the 10th inst., Mr. J. Glaisher, F.R.S., President, being in the chair, it was announced that Captain A. M. Mantell, R.E., had been elected Hon. Sec. by the Council, and that Dr. Lindsay Johnson had been appointed librarian. Letters were read from Colonel Waterhouse and M. G. Lippmann, the latter promising to send some of his photographs in colour at an early date. Messrs. A. C. Braham, W. Grove, G. McDonald, and H. Young were elected members of the Society. Sir David Salomons read a paper on "Standard Registering Slides and their Mode of Use," in which he described an improved form of registering cross. He then showed and explained his optical lantern, and exhibited a number of effect slides to demonstrate the accurate register he was able to secure by his improved crosses. Mr. W. E. Debenham then demonstrated the effect of throwing overlapping coloured discs of light upon a screen. The Chairman then announced that at the next technical meeting, to be held on the 24th inst., the subject for discussion would be "Hand Cameras," and he invited members to bring their cameras with them. On the 31st inst. there would be a lantern night and a discussion on lantern matters. Mr. W. Willis would read a paper on Platinotype at the meeting on April 14th.

**Putney.**—On the 11th inst. Mr. G. Davison gave his promised lecture on "The Art Side of Photography," before the members of this Society. After a few brief remarks on the relation of art to photography, he divided his lecture into the following sections:—Tone, Balance of Lines, Focus, etc., illustrating his remarks under each heading by handing round for inspection numerous prints, all of which were thoroughly appreciated. The printing in of clouds, the trimming of prints, and the mounting and framing in the most effective manner received his attention, as did the effect of an addition of mercuric chloride to the platinotype bath, the use of lenses, stops, and finally pinhole photography. At the close of his lecture a discussion took place.

**Richmond.**—At the weekly meeting on the 13th inst., Mr. Cembrano presiding, photometers and actinometers were discussed, and specimens of Decoudun's actinometer and Watkins' exposure meter for camera work, and Sawyer's, Burton's, and others for printing purposes, were shown and explained.

**Sheffield Optical.**—The second annual conversazione and lantern exhibition in connection with the above society was held in the Cambridge Hall, on the 11th and 12th inst., and was a great success in every way, the hall being crowded each evening. On Wednesday the hall was opened from six to eight for the exhibition of pictures by the members; photographs, photographic and lantern apparatus, etc., kindly lent by Mr. G. V. Yates, Mr. Preston, Messrs. Hibbert Bros., the Sheffield Photo Company, and Mr. J. Christie, after which there was an entertainment, presided over by Councillor A. M. Wilson. The President of the society (Dr. A. J. Manton) delivered a short address, in which he pointed out the vast improvement that had been made in the lantern, and the many uses to which it was now put, and also spoke of the great advance the society had made since its formation thirteen months ago. During the evening a large number of slides, the work of the members, were shown on the screen by means of Mr. H. Staniforth's splendid triple lantern; also slides lent by Mr. T. G. Hibbert, and a magnificent series of slides lent of the London Lantern Society, consisting of flower studies and views of English cathedrals, which were acknowledged to be the finest shown in Sheffield. On Thursday the exhibition was open from two till eight, and afterwards a similar entertainment was given, presided over by Councillor W. R. Carter.

**Shoreditch.**—The first meeting in connection with the proposed photographic club for Shoreditch and district was held on the 16th inst., in the Coffee Rooms of the "London Apprentice," 333, Old Street, E.C., when the following resolutions were adopted:—Name of club to be "The East London Photographic Society"; meeting nights, first and third Monday in each month at 8.30 p.m.; place of meeting, coffee room, "London Apprentice," 333, Old Street, E.C.; officers to consist of President, Vice-Presidents, Secretary, and a Committee of six, four to form a quorum; annual subscription, five shillings, payable 1st May; hon. members, ten shillings. The meeting

was adjourned till Tuesday, the 24th inst., when the election of officers will take place.

**Stockton.**—The usual monthly meeting was held on the 10th inst., Dr. Stainthorpe, President, in the chair. After the usual business was got through, the society's monthly competitive pictures, "A Winter Scene," were passed round for inspection and voted upon. Mr. Ellam was declared to have received the largest number of marks. On the 16th inst. a special lantern evening was held, when a series of views, illustrating Holland, were passed through the lantern by Mr. J. Stagg Byers, J.P., before a large attendance of members and friends, Mr. H. Macdonnell, with his usual good grace, describing each slide.

**Toynbee.**—On the 10th inst. Mr. A. W. Price gave a very interesting description of copying woodcuts by photography, illustrated with some fifty lantern slides, copies of some of the best woodcuts, many of them very rare, and considering that the paper upon which they were printed had in many cases turned yellow with age, the whites of the slides were very good. Mr. Price thought that isochromatic plates would be very useful in work of this sort.

**Tunbridge Wells.**—The ordinary monthly meeting was held on the 12th inst., the President (Mr. F. G. Smart) in the chair. A communication from the Brighton Society was read by the Hon. Secretary as to whether the members would join them in an excursion to East Grinstead on the August Bank Holiday, which was agreed to, and the Hon. Sec. was instructed to write to that effect. Mr. F. W. Ellis was duly elected a member. Dr. Abbott gave his lecture on "Optics." The lecture was profusely illustrated by diagrams and explanatory experiments, and was most attentively listened to. The lecturer last year had offered them a prize for the best photograph of trees without leaf, which was not awarded on account of the few entries; but he had kindly allowed it to be competed for this year, the conditions being the best six photographs of trees without leaf.

**West London.**—At the meeting on the 13th inst., Mr. W. A. Brown (President) in the chair, the Secretary announced that he had heard from the Assistant-Secretary of the Photographic Society of Great Britain to the effect that that Society had resolved to support the railway rates memorial, and also read a letter from the same gentleman to the effect that members would be welcome to view the Exhibition of Collotypes at Great Russell Street. The President announced the result of the meeting called by Mr. Biden on the subject of federation, and said he thought the smaller societies would be influenced largely by the action of the parent Society in the matter. The Council had, however, resolved to send two delegates to the next meeting on the 23rd inst. Mr. Hodges was inclined to doubt if it was worth while to do anything until more was known about the scheme. Mr. Roland Whiting read a paper on "The Laws of Art as Applied to Photography." A long discussion ensued.

**West Surrey.**—The members held their third annual exhibition at Crichton Hall, Clapham Junction, on Thursday, Friday, and Saturday last. There were displayed on the walls about three hundred photographs, mostly the work of members on the several outings during the past season, and generally speaking, not only was the number of prints larger, but the character of the work was better than that of previous years. There was a large attendance on the first day, when an attractive musical entertainment was provided in addition to the other attractions. The concert was interrupted about half-past nine and two gentlemen connected with Messrs. Marion's, took several flashlight portraits of the audience, using for the purpose two of Mr. Shipley's arrangements, one on either side of the camera. A number of very excellent slides were then passed through the lantern, and the evening was voted a great success. Lantern exhibitions were also given on Friday and Saturday.

## Quarterly Examinations in Photography.

**Question 22.**—Copy p. vi. of this week's (March 6th, 1891) AMATEUR PHOTOGRAPHER, one-third size.

**ANSWER.**—I first pinned the page (upside down for convenience in focussing) on a board fixed vertically at right angles to another board on which the camera rested. I referred to a table for enlarging and reducing which is given in the almanacs, and found that using a 6 in. focus R.R. lens, the distance from centre of lens to the original should be 24 inches, and the distance from lens to focussing screen of camera should be 8 inches to reduce to one-third size. I carefully measured these distances, and adjusted camera to them, and then measured page vi. and also the one-third size image on focussing screen, and further adjusted camera until as exact as I could get it. I exposed at four o'clock, afternoon, under a skylight (which was, unfortunately, covered with snow), stop  $f/18$ , with lens at normal focus, but at present focus of 8 in. instead of 6 in. the value of the top would be  $f/24$ . I gave an exposure of 14 or 15 sec., and deve-

loped with pyro and ammonia, the pyro being in excess of about half as much again as the normal developer.

The print is on Eastman B bromide paper; exposure, 30 sec. to a gas burner; developer, hydroquinone (Thomas' formula).

DEVELOPOID.

**Question 23.**—Write a brief note on heliochromy.

**ANSWER.**—Heliochromy, or photography in colours, is usually taken to mean direct production of a coloured positive by photographic means, in contradistinction to processes where photography is the means for producing surfaces for printing in different colours in the press.

All or nearly all investigators have confined themselves to the production of direct positive reproductions of the colours, and not, as is the usual method, produced first a negative and then from this negative positive reproductions.

Sir J. Herschel wrote in 1886, "What is really wanted in the arts is a negative which will produce naturally coloured positives by the usual process of photographic reversal, no matter what the hues apparent on the negative may be. . . . This increases immensely the difficulty of the enquiry, as the greatest apparent success in the direct production of colour may prove the most certain road to failure in the ulterior processes of reproduction and multiplication."

Although this seems to be the most obvious view to take of the matter, no one seems to have done anything in this direction as yet. Seebeck, Becquerel, Niépce de St. Victor, Poitevin, and St. Florent all seem to have confined themselves to perfecting the methods of obtaining coloured images on paper or plates coated with silver chloride, the chloride usually giving the best colour results. The colours reproduced were usually those of the spectrum, the reproductions generally being only an approximation to the originals, and becoming obliterated on exposure to light. A principle which has been applied successfully to mechanical printing in colours, and of which an example was given in the *Photographic Quarterly*, is described by Mr. Ives, an American experimentalist. "This principle may be conveniently stated as that of producing sets of heliochromic negatives, by the action of light rays in proportion as they affect the sets of nerve fibrils in the eye, and images, or prints, from such negatives with colours which represent the primary colour sensations."

The latest step forward in the problem is that of M. Lippmann just published. He attacks it from a physical and not a chemical point. It is proved that the iridescent colours of soap bubbles and mother-of-pearl are due to the superposition of minute films, which reflect the light waves and produce the phenomenon of interference. M. Lippmann has succeeded in producing the same conditions in a sensitive silver film, such as used in photography, which is developed and fixed pretty much as usual. As far as can be seen, the colours after fixation are permanent, and not affected by light.

DEVELOPOID.

**Question 24.**—It is desired to obtain a relief cast of a seal. The seal has been photographed, and you are in possession of the negative; how would you obtain a cast from it?

**ANSWER.**—There are two or three methods by which this could be done, but the following I think is the simplest. A rather dense transparency is first made from the negative, showing direct when looking at the film. A plate is next prepared coated with gelatine sensitised with bichromate of potash, the film being about as thick as a stout mounting board. This plate is then exposed under the transparency for about the same time as would suffice for an ordinary silver print, care being taken that the light shall fall perpendicularly to the plate, and not obliquely, after which it is placed in cold water for ten minutes, when the parts protected from light by the transparency swell, and stand out in relief. As the dark parts of the transparency represent the sunk portions of the seal, a gelatine mould will be formed from which a plaster cast can be taken. The plate is dried with a soft cloth, dabbed over with oil, and a wood or cardboard border formed on it to form the edges of the mould. Plaster of Paris mixed to the consistency of cream is then poured into the mould, care being taken that no air bubbles are formed, and after this has been allowed to set, it is removed from the mould and the operation is complete.

WORFIELD.

Papers have been received from, and marks awarded to Worfield, Lindum, R. C. M., Electra, Sunesis, Developoid, Spain, E. B. C.

**Note to Answer 22.**—One or two competitors evidently misunderstood the term "one-third the size," taking this to refer to area measurement and not linear, as is usual in photography. Two competitors failed to state the plates they used, only two sent in first-class results, and one print, though good, had been toned to a brownish-black colour with platinum, which did not agree with the original. The chief failure seems to be in not obtaining a dense ground to the negative, and consequent dirty whites in the prints and poor grey letters instead of rich blacks. The print of the successful competitor was exceptionally good.

## To Correspondents.

THE insertion of **QUESTIONS** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance, the number and full title of the query referred to.

## QUERIES.

4562. **Bath, Dark-Room and Scenery at.**—Would any Bath resident kindly inform as to dark-room, and also the most artistic bits in neighbourhood, etc., with hints as to morning or afternoon light? Any information as to permission required, etc., very welcome.—**PROGRESS.**

4563. **Stops to Dallmeyer's Lens.**—Will one of your mathematical readers kindly inform me what is the f nomenclature of the stops of Dallmeyer's rapid rectilinear lens of  $8\frac{1}{2}$  in. equivalent focus? The stops are marked and numbered as follows—17, 372, X, 2.3, 4.5.—**M. F. Y.**

4564. **Rectilinear Lenses.**—Can any one tell me which is the cheapest rectilinear lens (half-plate) which gives good definition, and let me see specimen photographs taken with it, which would be returned?—**PAUPER.**

4565. **Water Colours and Photography.**—What preparation has to be put on an ordinary silver photographic print to enable it to be coloured with ordinary water colours?—**BUTLER.**

4566. **Switzerland.**—I am in Switzerland, and we have brightly illuminated snow and clear sky with bright sun. There are also black patches of pine trees about. How must I expose and develop a plate which has been exposed to such a view? If I expose for mountains and snow, the black trees are underexposed, and if I expose for trees, the mountains, etc., are much overexposed.—**DAVOS-PLATZ.**

4567. **Hand or Instantaneous Camera.**—Which is most suitable for following description of work? (1) Taking animals which are likely to move and so cannot be properly focussed. (2) Taking views of streets, etc., or places where the obnoxious spectator intervenes to spoil the picture. (3) For ordinary work where, having to carry a heavy camera, legs, and large number of slides, would in many cases deter one from attempting any photography at all. In all cases, good results would be enlarged by daylight on bromide paper.—**CORNWALL.**

4568. **Mounting.**—After I have mounted a print on a plate-sunk or Oxford mount, the mount with the picture on curls a little, and on bending it in the opposite direction it gets into a twisted sort of shape and refuses to lie quite flat. Will some reader kindly give me a reliable way of preventing this?—**DAVOS-PLATZ.**

4569. **Camera.**—Can any one tell me whether Lancaster's half-plate International camera is thoroughly well made and good in every way? Is it portable and light? Any information about this camera will be gladly received by—**BEGINNER.**

4570. **Exposure Meter.**—Can any one kindly recommend me a correct exposure meter, must be good and cheap. Is the Watkin's exposure meter a thoroughly efficient article?—**BEGINNER.**

4571. **Lens.**—Will some kind reader tell me what would be the best kind of lens for taking landscapes and portraits with an occasional attempt at buildings and churches? Am I expecting too much from one lens? Any information on the subject will be gladly received.—**BEGINNER.**

4572. **Photographing of Groups of Ferns and Flowers.**—A paragraph in the **AMATEUR PHOTOGRAPHER** states that a Nottingham lace curtain manufacturer uses this process for the production of designs for his curtains. As I am anxious to obtain a few negatives of such groups, could any of your

readers put me in the way of communicating with the firm referred, or with any one else producing similar groups?—**E. A. W.**

4573. **Lamp Shades.**—Would any one kindly tell me whether Eastman's or other films can be used as transparencies for this purpose?—**MONTIBELLO.**

4574. **Opalines.**Will any one kindly inform me the best way to mount opalines? I have followed out the instructions given me with the glasses, but always get some small air bubbles between, which when dry look like little silver spots. Any information how to prevent this will greatly oblige.—**W. C. L.**

4575. **Drying Prints.**—Following the instructions given in several books as to the best way of drying prints, I recently dried a very large batch between folds of pink blotting paper. On examining them next morning, I found to my disgust they were nearly all stained in places by the pink off the blotting paper. I have tried hot water and other means, but cannot get off the stains. The blotting paper was the best kind, and I cannot in any way account for its marking the prints. Can any one recommend me anything that would remove the stains, also tell me if I should have used white instead of pink blotting paper?—**UNHAPPY BEGINNER.**

4576. **Print Washer.**—Will some one recommend me the best combined plate and print washer they know of?—**WASHER.**

4577. **Electric Light for Dark-Room.**—Knowing some of your readers interest themselves in electricity, I should feel obliged if some one would tell me the way to fit up a lamp for dark-room. Or could they recommend me any book with simple instructions?—**F. POWELL.**

4578. **Lantern Slides.**—I am about to make some of these on Ilford special plates for black tones. There are no directions as to toning sent with the plates, but I am told all lantern slides should be toned. What toning formula is best? Will that for ordinary albumenised paper be suitable, or is toning unnecessary? I will use hydroquinone as developer; my slides will be principally interiors and wood-carving, not landscapes. I have just got Hepworth's "Book of the Lantern."—**J. H.**

4579. **Quarter-plate Converted into a Hand-Camera.**—Can any reader inform me where I can have my quarter-plate camera made into a hand-camera?—**J. H. S.**

4580. **Black Cloth for Dark-Tent.**—Will any of your readers tell me where I can get an inexpensive black cloth for dark box tent?—**G. H. S. (Burnley).**

4581. **Lead Toning and Fixing.**—Can any reader kindly tell me of a good formula for a combined lead toning and fixing bath?—**CHESTER.**

4582. **Lower Wye.**—Will any one kindly inform me which place would make the most convenient centre to stay at down the lower Wye? Ross or Monmouth, or a smaller place preferred, where lodgings can be had. I intend photographing there in May.—**THANKFUL.**

## QUERIES UNANSWERED.

March 6th.—Nos. 4548, 4551.

13th.—Nos. 4553, 4554, 4555, 4559, 4560.

## ANSWERS.

4549. **Book on Toning.**—Enquire of the Editor, or consult Wall's "Dictionary of Photography," which gives about thirty different toning formulae and full instructions for use.—**EDYLLION.**

4550. **Exposure.**—I find a full exposure the best for this work, but you do not give size of drawing to be copied or stop to be used. I find, however, the following entry in my note-book of an oil painting copied this month in an ordinary room near a window, which may be some guide—size of picture, 3 ft. by 2 ft., stop  $f/16$ , time of day 11.30, light fairly good, exposure three minutes, plate Ilford ordinary, result good, negative all detail in shadows, developer pyro and ammonia.—**EDYLLION.**

4552. **Positives.**—You will find the various formulae at the end of the "British Journal Almanac"; they would take up too much space to quote at length in this column.—**EDYLLION.**

4556. **Walking Stick Stand.**—I have seen walking stick stands being made by Mr. Platt, Birkbeck Works, Birkbeck Road, Ridley Road, Dalston, N.E., but do not know very much about them, only that it had no guy ropes; and as for working out designs in brass or wood, you could not go to a better man. He has done some excellent work for me.—**C. WILLARD.**

4553. **Walking Stick Stand.**—Mr. J. M. Turnbull, of Rose Street, Edinburgh, brought out last year a walking stick stand which answers "Eboracum's" requirements. It is made on a principle which is unique among walking stick stands, and it possesses the double merit of being the neatest stand of the kind, and of being perfectly rigid when in use. In appearance it is indistinguishable from a walking stick, and when used as a stand it gives the customary six points of connection with the top. Most dealers keep it.—**J. P.**

4556. **Walking Stick Stand.**—The cheapest yet strongest stand, I believe, is made by J. F. Shew

and Co., 87 and 88, Newman Street, Oxford Street, London, and its price is only 25s. I should advise "Eboracum" to invest in one.—**CHESTER.**

4557. **Red Tones.**—Try a soaking in a saturated solution of washing soda.—**CHESTER.**

4558. **Portraits.**—Large stop and slow plate, certainly, unless the work is very small, working at  $f/8$  with Ilford ordinary and light fairly good; cap off and on will be sufficient exposure.—**EDYLLION.**

4561. **Copying.**—Rack out your camera to double the focal length of lens, and place carte-de-visite at same distance from lens, then slightly focus to get it sharp, place the print as near the window as possible; the exposure would be about a minute on a slow plate.—**EDYLLION.**

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us **BEFORE TUESDAY MORNING'S POST** if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—**ED: AM: PHOT:**

**NOTE.**—In this column we cannot advise upon purchase of APPARATUS, PLATES, PAPER, or PHOTOGRAPHIC MATERIALS.

Advice will be given upon questions of "Photographic Procedure," negatives and prints will be criticised, and every help given to the worker in photography.

T. T. S. METCALFE.—We are sure Mr. Baird and many other of our readers will thank you for your kind letter and the copy of rules.

BART ROUS.—Have written to you. Any help in that direction will be of great service.

W. G. THOMSON.—See notice. We can do nothing in the matter of the defaulting member. About the other matter we will write you.

FIRST ATTEMPT.—(A) Write to the Secretary of the Glasgow and West of Scotland Amateur Photographic Association, Mr. Wm. Goodwin, 3, Lynedock Street, Glasgow. (B) Yes, No.

SVET (St. Petersburg).—See rule at head of this column.

S. C. B. (Genoa).—(1) Not considered generally necessary. (2) See rule at head of this column.

W. GUILLMAN.—Any dealer will advise you which to buy and also tell you of the capabilities of the lens. Yes, you can use a carrier. Any reasonable time, provided the plate does not get damp.

J. A.—The one you name, i.e., the West London Photographic Society, would be the nearest.

T. KID.—You will find "Photographic Chemistry" (Medola) a capital book. We send you a list of our own books. They are all written expressly for the use of amateurs.

UMBRIA.—(1) Yes. (2) Yes. (3) We know only of No. 1.

SYCAMORE VILLA.—See rule at head of this column.

J. E. THORNBURN.—The notice has appeared.

H. C. S.—We are not able to give the value of the second-hand lens you name.

TALBOT.—Certainly, you can proceed as you state. Take care that the prints are in true optical contact.

T. G. ELSWORTH.—See our rule at the head of this column. The firm named have a very good changing-box. We do not know anything about the lens named.

H. L. T. H.—Glad you have succeeded so well.

H. S. W. E.—Magazine form would seem to be most popular. Write the firms for particulars. No objection whatever to the use of sheaths. You can see the last camera at almost any dealer's. We cannot undertake to advise. See rule at the head of this column.

F. E. C.—We have written to you.

MUTE.—See note at the head of column, still as your first query involves a general optical principle, we may state that it is a very poor lens that requires No. 5 stop to get both margin and centre in focus.

T. W. HUNTER.—Send on at once particulars of paper you are using. Is it home sensitised, or whose? We will write you and return prints.

SUNESIS.—Imagine the prints for the nonce are yours, and treat them, therefore, as you like.

W. TRELAWEY ADAMS (Natal, S. Africa).—"Our Rose Garden," most fearfully overexposed; the other quarter-plate is decidedly better. The house is tumbling backwards and plate much overexposed; the figures are good. No. 1. Fully exposed and would have stood a little more developing. No. 2. Good. No. 3. There is hardly enough interest in this picture.

WEST BROMWICH.—Do not use the hypo-eliminator, plain water is far better. Pleased to see prints.

R. C. M.—You are rather inclined to underexpose. You can obtain a much better black tone by exposing for a relative time at a good distance from the gas or source of light, and using a developer rather strong in iron, to which you might also add 1 dr. of sulphurous acid to every ounce of mixed developer. Good prints of the cottages and water-

fall; might stand a chance in our competitions. Write us again.

**LEO.**—Use the same proportions and make up 1½ oz. of developer for a quarter-plate print. We will try and let you have prints as soon as possible, but we have unfortunately other work to do as well.

**NIEPCE.**—The statement was evidently copied from an exchange journal, and there is no intensifying action at all. The gentleman named in your letter will call on us this week, and we will ask him about your letter.

**VERNON.**—(1) Would have been improved by deeper printing and deeper toning. It is a very good portrait, however, of "A Grave and Reverend Signior." (2) This is spoilt by the top of the chimney and the end of the house being cut off. (3) We have trimmed a bit off this print, which improves it; it is rather over-toned. We have also just trimmed 1 and 2. Prints returned. Send us some more in a month.

**W. OREWKE.**—A watch spring, to be had from any jeweller's.

**T. F. BELL.**—You are using the tartaric acid solution too strong, add less. Throw away what you have mixed, make up fresh solutions and add the acid gradually till the sulphite smells strong and shows just a suspicion of clouding. Any acid will do, provided you don't add too much; the acid sulphite solution should be quite clear.

**H. W. MALE.**—(1) Yes. The probable exposure would be five minutes under the conditions named. (2) Black needle paper is better than tissue paper, treated as you suggest. (3) We should prefer the potash and soda without any bromide. It acts well on the plates named.

**NOVICE.**—You should always give as much information as to any print sent us; your print is presumably on albumenised paper. It has been shifted in printing or else the plate during exposure, everything has a double outline. It is not toned enough, and you should have added your gold to the boiling borax solution and used it as soon as lukewarm. Try an acetate bath. Varnish your negative and use Indian ink, burnt sienna and carmine lake mixed. The probable exposure would be for rapid bromide paper about 10 sec., for slow bromide about three minutes.

**CORNWALL.**—You have probably over-exposed in No. 1. We will test sample and reply next week. See Query Column.

**MALANTANAPIAN.**—You certainly could use the lantern for enlarging if you prevented the egress of any light from it; but of course you know there are few negatives will stand such an enlargement as you want.

**PHOS.**—(1) We are constantly using the apparatus named with good results. (2) About 12 by 10. (3) The gradation is of course different in the case you mention to that of correct exposure, but you cannot say that the negative is injuriously affected.

**F. H. RUEL.**—Generally those who "do the sneering" are the "Sir Oracles" amongst amateurs, who wish to pose as authorities on anything and everything who know but little really, and think it big to sneer at what men a great deal more experienced than they are use with advantage. The light named is excellent. Let us see some prints by all means. There is no reason why you should not compete even if you get severely criticised.

**JAGO FYCHAU.**—Make the following solution:

Yellow resin, in powder ... 36 gr.  
Yellow wax ... 12  
Benzine ... 2 oz.

Melt the wax and add the benzine, being careful that any flame does not come near the benzine, then add the resin. Pour a little of this on the clean glass, rub all over it, and polish with a pad of clean flannel. The prints won't stick then.

**KRA.**—(1) The advantages of the use of acid sulphite in the negative fixing bath are that it hardens and clears the film and never stains the negative; as the tartaric and sulphite practically form the same thing, there is no question of superiority. (2) The acid sulphite has the advantages, as a pyro preservative, that it is really very effectual in this respect and less of it is needed than the ordinary sulphite used; at the same time rather more alkali is required.

**PYRO.**—The acid sulphite solution can be obtained from almost any photographic dealer. You cannot make it yourself. Try this formula:

Pyro ... 1 oz. bot.  
Sodium sulphite ... 3, avoird.  
Sulphuric acid, pure ... 30 drops.  
Distilled water, to make ... 9 oz.

Dissolve the sulphite in about 6 oz. of water made hot, add the sulphuric acid, shake well, pour on to the pyro, and immediately bottle.

**J. H. TAYLOR.**—Many thanks; your idea is by no means new, though the actual method of carrying it out is. We may utilize.

**W. F. KELLY.**—(1) We quite agree with you and have steadfastly set our faces against such an inartistic colour which cannot be removed when once there. (2) Give them an early chromealum bath, as recommended by Mr. Wall in our correspondence columns a week or two back. (3) If you use the alum bath first and then wash well, the combined bath without alum would give you permanent results. (4) It is

not absolutely necessary to varnish but advisable, the cold varnish will do. We shall shortly have a note on this subject which will help you.

**BORAX.**—(1) Yes the prints require deeper printing, the prints are quite as permanent, but the toning bath is certainly not likely to last long. The fixing bath should be of the same temperature as the toning and washing waters. (2) You omitted to state how much gold you added to your bath, add fresh gold in the proportion of one grain for every sheet, and test the bath to see whether acid or alkaline; if the former, add more borax. (3) All the papers you mention are excellent, it is merely a question of personal taste.

**TEMPUS FUGIT.**—(1) You are choosing curious places for your lights. Generally one tries to avoid the west because of the sun, we should much prefer the east side; put in as much glass as you can; nine cases out of ten you won't want it, the tenth you will, and be thankful then for all you have got. (2) You cannot do better than stick to the lens you have, which will do all you want. (3) A pale grey. (4) Cut small pieces out of an old pair of black kid gloves, and cement with diamond cement over the pinholes inside the camera bellows. (5) You may use either starch, but flour paste makes a more adhesive mountant, though it is more liable to turn rancid; rub 1 oz. of starch or flour to a paste with cold water, add 8½ oz. of boiling water, and boil up once or twice, stirring well, add five drops of carbolic acid, and when cool it is fit for use.

**H. HAMMOND.**—Will you, when next you notice the defect, send us up some plates just as you have exposed them, and we will try and see whether we are not more fortunate than you. The very fact that you find them on different brands of plates proves that it is most likely dust.

**VALOIS.**—Prints to hands. We will tone and write you by post.

**NOTE.**—We have received two negatives, one the exterior of a house, the other of a lady nursing a cat, but we are unable to trace any letter respecting the same. We shall be glad to hear from the owner about them.

**OMEGA.**—The rule given is one which is accepted by all authorities as correct, but the original proposer we do not know. The following, given by Wm. Cheyney in an American magazine lately, may help you:

Let  $f$  = the equiv. focus.  
 $a$  = diameter of lens aperture.  
 $e$  = the greatest allowable error or disc of confusion.

Then  $d$  = the distance of an object upon which, if the lens be accurately focussed, all objects beyond  $d/2$  will apparently be in focus.

Thus:

$\frac{a \times f}{e} + f = d$ , then  $d \div 2$  = nearest point in focus.

Let us take your poser:

$f = 5\frac{1}{2}$ ;  $a = (5\frac{1}{2} \div 8) = 1\frac{1}{16}$ ;  $e = \frac{\pi}{16}$  of an inch.

Then,

$\frac{1\frac{1}{16} \times 5\frac{1}{2}}{1\frac{1}{16}} + 5\frac{1}{2} = d$ , =  $945 + 5\frac{1}{2} = d$ , =  $950\frac{1}{2}$ .

$\therefore d = 79$  ft.  $\therefore d/2 = 39$  ft. 6 in., the nearest point in focus.

If, however, we take  $\frac{1}{16}$  of an inch as the diameter of the permissible disc of confusion, we get results quite different.

Thus:

$\frac{1\frac{1}{16} \times 5\frac{1}{2}}{1\frac{1}{16}} + 5\frac{1}{2} = d$ , =  $373 + 5\frac{1}{2}$  in. =  $383$  in.

$\therefore d = 383$  in. or 32 ft. approx.  $\therefore d/2 = 16$  ft.

This gets you out of your difficulty, we think. It is simply a question of the diameter of the permissible disc of confusion, or degree of sharpness considered desirable.

**ANAXAGORAS.**—The use of the tripod would tend to the production of more artistic work by causing greater care to be exercised in the selection of view. See note at the head of this column.

## Quarterly Examinations in Photography.

### QUESTIONS.

28. Make a lantern slide from the negative which you obtained for Question 22, and forward with the negative and statement of procedure with your answers.
29. What is the best method of collecting silver residues, and is this advisable for an amateur?
30. What is known as Feer's process?

(Latest Day for Answers—March 30th.)

## Sale and Exchange.

**RULES.**—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

**REPORTING UPON APPARATUS.**—The Editor of the AMATEUR PHOTOGRAPHER will be pleased to report, to any intending purchaser, upon apparatus, etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the SELLER to him to the offices of the AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending BUYER to pay a fee equivalent to a commission of 2½ per cent., the minimum fee being 2s. 6d., upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the SELLER. As far as possible, the Editor will undertake to send a report within TWO DAYS of receipt of goods.

### DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. 3d. is made whether a sale is effected or not.

Advertisements can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 3d. to cover postage.

**N.B.**—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

"Amateur Photographer," etc.—AMATEUR PHOTOGRAPHER, No. 1 to date, 338 numbers, all clean, indexes complete, three binding cases; what offers cash or exchange? — Drummond, Barker's Lane, Sale, Cheshire.

AMATEUR PHOTOGRAPHER, 51 copies, six "Photography;" offers? — Thornton, 48, Walton Street, Chelsea.

AMATEUR PHOTOGRAPHER, complete from commencement, four years bound, rest unbound, clean, as new; price 80s.—W. North, 62, New Road, Aylesbury. Backgrounds.—Three backgrounds in flatted oils, on linen and roller, painted by advertiser during dull business, garden scene, with graduated centre, 8 ft. by 88 in., 12s. 6d.; landscape, with large tree and foliage, 8 ft. by 78 in., 10s. 6d.; pure landscape, with cloud effect, 8 ft. by 78 in., 10s. 6d.; new and perfect; photographs forwarded. — William J. Hare, Photographer, Sutton, Surrey.

Cloth background, on roller, 8 by 6, exterior quite new, 12s.; also paper interior, 8 by 5, 5s. — Walsh, 179, Walter Street, Blackburn.

Bicycles.—Premier Safety bicycle (by Hillman, Herbert, and Cooper), splendid machine, and in first-class condition, with Salsbury lamp and bell complete; £7 10s.; seen by appointment only.—Congdon, 38, Parliament Street, S.W.

Safety bicycle, cushion tyres, balls everywhere; £7 10s.; just cost £14; approval with pleasure.—Cyclist, 7, Dereham Road, Norwich.

Cameras, etc.—Marion's metal miniature camera, with 12 dark-slides, takes pictures 2 in. square, with finder; no reasonable offer refused. — Jackson, 71, Oxford Street, Manchester.

Sands and Hunter's Exhibition quarter-plate camera, new last month, focusses to 13 ins., every possible movement, three best slides, and tripod stand; £1 15s.; list price £7.—Hodges, 87, Chancery Lane.

Hare's cameras. Mr. Gambier Bolton wishes to dispose of a half-plate, with four double backs, leather case, and stand, all in perfect condition, and good as new, cost 12 guineas, price 7 guineas only; also a splendid whole-plate, scarcely soiled, with four double backs, leather case, and good stand, cost 14 guineas, price 10 guineas only. These are thoroughly genuine, and have done but little work.—Address, care of Messrs. Briggs and Son, High Street, St. John's Wood, N.W.

12 by 10 long-focus camera, all movements, pneumatic shutter inside, book slide, carriers, rigid stand, dishes, printing frames, etc., etc., all new; £8 to immediate purchaser. — Hukes, New Road, Dartmouth.

Half-plate box camera, two single slides; 10s.—O. Naylor, Batley.

Condenser, 10 in., mounted on mahogany base, iron standards, enlarging camera, 12 by 15, carriers to quarter-plate; £7.—Wm. Wells, 14, Girdler's Road, West Kensington.

Cameras, Lenses, etc.—Lancaster's stereo Instantograph, with arrangement for taking plates 7½

by 44, and extra bellows for stereo work, best lenses, Iris diaphragms, stereoscopic shutter, three double mahogany dark-slides, fitted also with 7 by 5 rapid landscape lens,  $f/3$ . tripod, stiff case with spring lock, two negative boxes, printing frames, etc., new last season; will take £3, or offers. — L. J. Miskin, 162, York Road, S.E.

Whole-plate McKellen extension camera, with one double slide and Eastman's roll holder in case, together with Ross' 10 by 8 R.R. lens and Kershaw shutter; £11 10s.—Baird, 15, Lothian Street, Edinburgh.

6½ by 4½ camera, rack and pinion, tripod, partition, pair of Optimus 5 by 4 R.R. lenses, three double, one single backs, new condition; £6.—C. Naylor, Batley.

Cyclists' camera, all movements, takes plates 3½ by 2½, six double backs, cost 60s., price 35s.; also 5 by 4 rectilinear and wide-angle (by Wrench), splendid lenses, 18s. 6d. each; quarter-plate stand, 5s.; folding ruby lamp, 3s. 6d.—T. Hall, Skerton, Lancaster.

Superior 5 by 4 Blair camera, all movements, R.L. lens, Dewey's patent instantaneous and time shutter (new), five double F.W. slides, case, three-fold tripod, trays, frames, etc.; bargain, 84s.; cost double.—F. J. Fowler, Park Leys, Stratford-on-Avon.

Lancaster's half-plate 1889 Instantograph camera, instantaneous lens and shutter, three double dark-slides, and two-fold tripod, all excellent condition; £4.—Timson, Lees, near Keighley.

Whole-plate camera, with all latest improvements, three double backs, Wray's R.R. lens, Thornton-Pickard shutter, Lancaster's sliding ash tripod, canvas cases, etc.; £9 10s.—G. Constable, Market Street, Lewes.

Lancaster's quarter-plate special brass-bound Instantograph, three brass-bound double backs, lens, See-saw shutter, Iris diaphragms, complete in lock-up leather-bound case, tripod, dishes, printing frames, etc.; 70s. the lot.—Edwin Jewitt, Matlock.

A large enlarging camera, 7 in. condenser, £2; Mason's cabinet lens, 30s.; 8 in. burnisher, 10s. 6d.; 15 by 12 dark slide, 10s. 6d.; 15 by 12 Ross triplet lens, £6.—Ernest W. Bielby, 24, West Promenade, Dryfield, Yorks.

Half-plate camera (by Photographic Artists' Stores), long extension, reversing back, three double dark slides with carriers, all in good condition; also Instantograph lens and shutter for same, 70s. the lot, a bargain.—Kelly, 26, Rye Hill Park, Peckham Rye.

Dark-Slides.—Six half-plate best quality mahogany double dark-slides, book form, with hinged shutters, new, price 7s. each, or £2 the lot; Wray's 7½ by 5 wide-angle landscape lens, 7½ in. focus, price 35s.—Dollery, 67, Charing Cross, S.W.

Hand-Cameras, etc.—Newton's hand-camera, in red morocco case, with three double backs, splendid R.R. lens,  $f/8$ , two finders for vertical or horizontal pictures, time or instantaneous shutter, can be used on stand with focussing screen as ordinary camera, very best workmanship throughout; cost £7 10s.; for £3 3s.; owner having another camera. Can be seen at offices of AMATEUR PHOTOGRAPHER.—No. 128, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Roberts' hand-camera (for description see article in AMATEUR PHOTOGRAPHER, March 13th), condition perfect, never taken out; £3; or exchange for first-class half plate lens.—Doctor, 27, Chandos Road, Bristol.

Fallowfield's Facile, leather covered, 5 by 4 rapid rectilinear lens, four stops; £5.—M. O. Forster, 32, Binfield Road, Clapham.

No. 1 Kodak, almost new, in leather case; price 50s.; cost £5.—S., 4, Seville Street, Lowndes Square.

Hand-camera, Samuel's quarter patent, new, 4½s.; rectilinear lens, 7 by 5, hood, stops, working  $f/8$ , 25s.; canvas camera case, strong, good straps, leather-fitted, 9s.; approval.—1, Hermitage Mews, Stamford Hill, N.

Hand-camera, quarter-plate, complete with rapid rectilinear lens, six double backs, Thornton-Pickard shutter and finder, in first-class condition, a genuine bargain, price 60s.—A. Mercer, 16, King Street Sparkbrook, Birmingham.

Lenses, etc.—For sale, a pair of Harrison's Globe W.A. lenses, 3 in. focus, cost £4 16s., price £2 10s.; Levi's portrait lens, 15s.; Levetours and Secretan's quarter-plate portrait lens, 15s.; quarter-plate portrait lens, 10s.—F. R. Upcott, 135, Brigstock Road, Thornton Heath. (Can be seen at the offices of the AMATEUR PHOTOGRAPHER.)

Ross' No. 5 portable symmetrical, £4; whole-plate Funnell's shutter, 18s.; both new last season.—H., 55, Val Plaisant, Jersey.

Half-plate rapid rectilinear  $f/8$  lens, Waterhouse stops, good condition; 21s.—H. Rowe, Wallbridge, Stroud.

Offers requested for a Lancaster's 1887 half-plate Instantograph lens (Iris diaphragm) and shutter, in perfect condition. Also, wanted, an efficient and handy changing bag for half-plates, cheap for cash.—G. T. Nichols, Broadway, Peterborough.

Fine 7 by 5 rapid rectilinear lens, in new condition, with Waterhouse diaphragms; 30s.—MacComas, 5, Laurence Pountney Lane, City.

5 by 4 portrait lens (by Stanley), Waterhouse stops; price 30s.; or exchange.—Whiteside, St. Nicholas, Cardiff.

Ross' rapid symmetrical, 8½ by 6½, 11 in. focus; value, new, £6 10s.; for £5, or offers.—Address, Editor, AMATEUR PHOTOGRAPHER.

Genuine 5 by 4 doublet lens (by Ross), complete; price 38s.—Lathen, Crawley Road, Luton.

Lens, Optimus 7 by 5 R.R., as new; 38s. net; deposit with Editor.—Middleton, 20, Rectory Road, Stoke Newington.

Ross' rapid symmetrical, whole plate, 12 in. focus, nearly new, cost £6 10s., will sell for £5; also Caldwell shutter, new, with tube out to fit above lens, cost £3 10s.; sell for £1 5s.—Apply, Louis, 14, Upper Ormond Quay, Dublin.

Optimus lens, 7½ by 5, new, also new Thornton double blind shutter; all cost £5; will sell for £3 5s.—Apply, McCabe, Bellville, Donnybrook, Dublin.

Voigtlander's cabinet lens, lens 3½ in. diameter, £10; Decoudun's photometer, 5s.—No. 130, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Single landscape lens, 20 in. focus, 3 in. diameter, price 5s.; c.d.v. portrait lens (by Squire), price 30s.; half-plate portrait lens, in very good condition, £2 2s.; pair stereo lenses, working at  $f/4$ , 10s. May be seen at the offices of the AMATEUR PHOTOGRAPHER.—No. 129, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Magic Lantern, etc.—Treadle lathe, 3 in. centres, iron standards, new, £8 or offers; magic lantern, 3 in. condensers, front lens, moving slides, 16s.; portrait lens, quarter single lens, half, 5s. each; six Tylar's slides, 10s.; bicycle lamp, 3s.—Brine, 105, St. Stephen's Road, Bow.

Lantern, binocular, mahogany body, brass fronts, 4 in. condensers, portrait lenses, safety jets, 10 ft. screen, elevator; offers?—Greaves, 1, Ridding Street, Oldham.

Good magic lantern, 4 in. condenser, oil or lime, 50s.; or exchange, with cash, for good safety cycle.—C. Naylor, Batley.

Roll Holders.—Thornton's 12 by 10 roll-holder, Tourist pattern, has ball indicator, and registers number of exposure; for £5 15s. 6d., or offers.—Address, Editor, AMATEUR PHOTOGRAPHER.

Eastman's 5 by 4 roll-holder, perfect; 23s. cash.—J. E. Ellam, Yarm.

Sets.—Superior set, half-plate, Sands and Hunter's Gem new light camera, brass-bound, double extension, every movement, three brass-bound double slides, Sands and Hunter's instantaneous and time shutter between lenses, pneumatic discharger, Taylor and Hobson's half-plate Casket lenses, 7 in. R.R. and 8 in. view, with Iris diaphragm, Ashford's Cyclist tripod; list price £20 7s.; accept 13 guineas.—Camera, 6, Montford Place, Kennington Green, London.

Lancaster's Meritote set, complete also Challenge R.R. lens, Gem shutter, changing bag; cash offers, together or separately 8, Portland Place, Venner Road, Sydenham.

Lancaster's half-plate Instantograph set, complete, good condition, £3, or exchange Fallowfield's Facile; Diamond detective, 15s.—Barker, 25, Harlow Terrace, Harrogate.

Shares.—5 Eastman Photographic Materials Co., Ltd. ten per cent. preference £10 shares, £5 paid up, call due in April; what offers?—No. 125, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Shutters.—One Newman's half-plate instantaneous shutter; £1.—Apply, A. B. Larkins, 49, Elsham Road, Kensington, W.

Sundries.—Will give "Gardening Illustrated," Nos. 1 to 135, with indexes, for "Photographic Quarterly" to date.—14, Cedar Road, Leicester.

Still (Bracher's automatic), nearly new, list price 18s. 9d.; what offers?—W. Sully, 18, Mount Street, Camberwell Gate, S.E.

"Photographic Reporter," Nos. 1 to 25 inclusive, good set; cost 14s.; price 7s. 6d.; or exchange vol. I. of "Photography" Wanted, No. 1 "Photographic Answers."—Coulthurst, Collyhurst Street, Manchester.

Optimus wide-angle symmetrical lens, 7 by 5, 38s.; splendid walking-stick tripod, 17s., cost 27s. 6d., both new; "Photographic News," bound, 1888, 1887, 1888; AMATEUR PHOTOGRAPHER, bound, 1889, 1890; four "British Journal Almanacs."—Higgin, 202, Upper Brook Street, Manchester.

Strong spring motor, with good swing machine attached, in going order, all newest fittings to machine, the whole got up in a superior style; cost £9 12s.; accept £2, or exchange photographic apparatus; seen any time.—Godfrey, 248, Caledonian Road, N.

Exchange double-barrelled breechloader and handsome 7-chamber nickel revolver for half-plate camera, with rapid Rectigraph lens, Iris diaphragms, shutter, etc.; must be perfect.—Address, Revolver, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Carson's spring carrier, 12s. 6d., cost 18s. 6d.; Sunbeam safety balls all over, including head, new last season, list price, including lamp, etc., nearly £19; price £11, or exchange for good double extension half-plate complete set and cash.—Pring's, 33, Arundel Square, N.

Tripod.—Tripod, three-fold, and brass triangle, light, rigid, cost 35s., sell 15s.—Apply, Louis, 14, Upper Ormond Quay, Dublin.

Views.—Peak of Teneriffe, Great Caldera of

Palma, views.—Soar, 1, Sussex Villas, Kensington, London, W.

Violin.—Splendid copy of Amati, rich brilliant tone, fine preservation, complete with baize-lined case and silver-mounted bow, only 15s. 6d. lot, great bargain. A quantity of unsoiled music given in gratis. Most genuine offer obtainable.—Write, Graham, College buildings, Ipswich.

## WANTED.

Cameras, etc.—Will give exchange or cash for good camera.—190, Heyside, Royton.

Good half camera, slides, lens optional, compact, cheap; full particulars.—88, Albert Road, Oroydon.

Whole-plate camera, long extension, three slides, good maker, cheap for cash.—Gibbs, Manchester House, Westminster, Bristol.

Cameras, Lenses, etc.—Modern quarter plate camera, rapid rectilinear lens, three or more slides, and tripod.—Gaines, 179, Roundhay Road, Leeds.

Quarter-plate camera, good lens, 2½ to 4 in. focus, without stand; particulars.—Taylor, 28, Gauze Street, Paisley, N.B.

Dark-Slides.—Three metal dark-slides, to fit half-plate Instanto, Tylar's preferred.—F. Powell, care of Arnold and Son, Chipping Sodbury.

Double slides, few wanted, half-plate Instantograph, must be reliable.—MacLachlan, Polytechnic, Coakbridge, by Glasgow.

Hand Cameras, etc.—Kodak, No. 3, in perfect order.—Bolton, Brook Lodge, Watford.

To hire quarter-plate hand-camera from about March 24th to 31st; deposit to value.—Particulars to R. Levershuch, Stanmore, Middlesex.

Hand-camera, any good make, cheap for cash; state full particulars and price.—Moorhead, 30, Rosemary Street, Belfast.

Hand-camera; will exchange mahogany-bodied lantern, 4 in. condensers, also quarter-plate camera, with half-plate lens to use with same.—Harding, Merrow, Guildford.

Lens, etc.—Wray's 5 by 4 R.R., with Iris.—J. F., 95, Portland Road, Nottingham.

Negatives.—Negatives of statuary, views (series preferred), also instantaneous pictures of shipping, etc., cash.—Thompson, care of Mrs. Jones, 20, The Parade, Acton Vale, Acton, W.

Roll-Holder.—Roll-holder for Shew's half-plate Eclipse hand-camera; would exchange Luzo.—Towers, 15, Portsdown Road, W.

Sundries.—Dark-room lamp and cloth bag-ground, 8 ft. by 6 ft., cheap, cash.—Macey, Obansea Schools, Stratford, E.

Scales, weights, and half-plate dipping bath and dipper for wet plate work, also old half-plate bellows camera or bellows.—Sutcliffe, 12, North Street, Burnley.

Tripod Stand.—Light half-plate three-fold tripod stand.—George Kilburn, Eastfield, Batley Carr, Dewsbury.

A GENTLEMAN, well known in the photographic world, author and translator of several photographic works, seeks a good position. Has a thorough knowledge of both practical and theoretical photography. Could manage a photographic works, or edit a photographic or scientific journal. Good business push and excellent connection.—Apply, JENA, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

The Tent and Studio may be used in combination, or independently of each other, and everything is sent out complete and ready for use.

Elegant in appearance. Easily erected. Strong, yet portable. Unique in design and price. A wonderfully effective aid to outdoor portraiture.

THE BEST AND CHEAPEST.

SOLE MANUFACTURER:  
**FRED. J. PROUTING, Tilehurst, Berks.**

**POWELL'S COMPRESSED HYDROQUINONE DEVELOPER.**

Will keep indefinitely. For Lantern and all other Plates, Opals, and Bromide Papers.

Results unequalled for Delicacy and Excellence.

Sole Agents—MARION & CO., 22 & 23, Soho Square, W.  
Sole Maker—T. H. FOWELL, Photographic Chemist, 116, Denmark Hill, London, S.E.

WE have been permitted to see some proofs of what may be rather an important improvement in photographic printing processes. The image is faintly visible when the exposure is complete, and the final result is a very fine black image, no silver is used in the process at all, the resultant colour being obtained in aniline black, which, as our informant states, may be boiled with acids or caustic alkalies without any effect on it. This, if brought to perfection, will certainly not be the first time that aniline has been used, as Mr. Willis, of platinotype fame, many years ago invented an aniline process, which, however, has never become general. The time may come, perhaps, when we shall no longer look upon silver as an absolute necessity for printing, platinotype, diazotype, and photo-mechanical processes becoming more and more general; and some of us would not be sorry, judging from the letters we receive, to say good-bye to toning and our old friend hypo for printing work.

Of the application and importance of photography to science, few of its devotees have any idea; and of the application of our art to meteorology and astronomical work we have, as a rule, but little conception. One of our contributors has forwarded us, however, a transparency of the moon, which we think is exceptionally fine, considering the difficulties or rather the method employed in taking it. The moon's image measures an inch in diameter, and was

obtained by a judicious combination of two or three photographic lenses of long focus, by which an enlarged image was obtained of the size named in half a second, the camera being kept in corresponding motion with the moon by means of hand movement, with the aid of a star and the spider lines of the telescope of a levelling staff.

WE understand that an exhibition of photographs on an extensive scale is to be held at St. Petersburg this year. The date has not yet been fixed, but we shall, of course, keep our readers posted up as to what is being done.

MR. EADWARD MUYBRIDGE, who is well known to our readers from his lectures on "Animal Locomotion," delivered last year in some of our principal towns, has been lecturing in Berlin, and our German contemporaries are filled with reports of the lectures and notes on the same. The lectures seem to have been received with various differences of opinion, some considering them as great advances upon anything yet shown, others as inferior to the work of Anschütz, who is well known as one of the first photographers of the day in this special department. Judging from specimens we have seen of work by both men, we have no hesitation in saying that Anschütz's work is far superior to that of Muybridge for beauty of modelling and lighting of the subjects, some of the studies of undraped men and women in active motion far surpassing anything ever previously attained.

ACCORDING to a brief note in a contemporary, a new phonograph has been introduced in Germany, in which the cylinder of wax is replaced by a concave plate of glass on which the vibrations caused by the voice are recorded by the action of a diamond-pointed stylus, and by this means it is possible to hear the reproduction of the recorded sound sixty feet from the instrument. We also hear incidentally that this is being experimented with to reproduce the recorded marks by photography, so that it may be possible to send by post a photographic reproduction of the receiving plate, and then by a simple process transfer these marks again to glass to be used in a phonograph in the ordinary way.

IF we get a spell of fine weather during the Easter holidays many of our readers will venture abroad on foot, by rail, and on wheels, in the hopes of obtaining some pictures, and although early, there is even now a

uspicion of green on more than one tree and shrub, and even bare branches may be utilised for picture making. Nor need our town readers go far afield for sights and scenes well worth recording by the camera, as many a picture is to be found in one of London's lungs, such as Hampstead, Wanstead, and other open spaces and parks.

THE questions given in this week's issue conclude the first of our "Quarterly Examinations in Photography," and we hope to publish the examiner's report in the AMATEUR PHOTOGRAPHER of the 10th prox. As our readers are aware, we founded this department to induce the less advanced workers to read up and endeavour to become better acquainted with the theory and practice of photography, and in the ensuing quarter we shall give twice a month some practical work to be done, such as developing plates, bromide paper printing, toning, etc., and we shall be glad if our readers will support our efforts by entering for this examination. We exclude recognised authorities on photographic matters, and have arranged for the examiners to give a brief note each week to the answers of each competitor, pointing out the errors in the answers sent; and, judging from the questions set last quarter, we are quite certain they are not too difficult. It would be ridiculous to give purely elementary questions which could be answered by everybody. The examiners have informed us that they have drawn up a new set of rules, which we shall publish next week, and in response to a request from us have given the following list of books as the most suitable for reference. We have appended prices, and any or all may be obtained from our publishers:—

WE note that the members of the Dublin Y.M.C.A. have just started a camera club, and will have a dark-room properly fitted up. Mr. L. Davidson, Hon. Secretary, of Lower Abbey Street, Dublin, will give further particulars.

A CORRESPONDENT writes:—"I have now taken in your paper for about 3½ years, so even in Persia it is not unknown."

WE are pleased to announce the formation of the Wakefield and District Photographic Society. Particulars will be found in another column. Messrs. G. F. Firth and Mr. H. H. Halliwell have undertaken to act as joint Hon. Secretaries. Already some thirty-eight members have been enrolled.

MANY may be interested to know that Mr. Wood, of Lord Street, Liverpool, has started the lending out of lantern slides on the circulating library system. A subscription of one guinea entitles the subscriber to the use of 300 slides during the year. Should more be required, they are charged for at the subscription rate. Mr. Wood will, of course, be glad to furnish particulars. The scheme seems to us to meet a want at the present time.

### PICTURES AT LIVERPOOL.

PROCEEDING with the pictures, we came to Class XI., "Animals, from Life." "Highland Cattle and Southdown Sheep," by E. J. Jackson, took our fancy. The prize frame, 485, by Charles Reid, contains good work; "Animals from Life, Melbourne," J. Catto, are very good, especially frame 491. Walter Pollard contributes four choice studies in "Watering," "A Pet Calf," "A Patient Beast," and "Waiting to Go Home." The class cannot be called a strong one, and we should have liked to have seen more variety.

In Groups, Class XII., F. M. Sutcliffe takes a silver medal for his photographs "Sunshine," "Gossip"—faces badly lighted—"Busy Leisure," and "Sitting Alone." F. Bremner sends some clever instantaneous studies (groups), for which he received a bronze medal. Lyd. Sawyer's studies on the Tyne and in Newcastle are admirable. Some very commercial photography is shown by Messrs. Werner and Son, groups of royalties, and "smart" people.

The Architectural series, Class XIII., is a large one, and, as is usual, there is some very fine work. John Collier shows some very clever interiors of the "Pathological Library," Queen's College, Birmingham, taken, we should say, under considerable difficulty. E. S. Gladstone sends a good picture of "Eaton Hall;" George Bankart, good and careful work, of which, perhaps, the best is "Galilee Chapel, Durham Cathedral." E. J. Jackson has four frames of "Old Houses, Worcester and Herefordshire," which are good photographs of very interesting subjects. The interiors "Osmaston Manor," seat of Sir Andrew Walker, Bart., by Richard Keene, are, like all his work, very carefully executed. C. S. Cobb shows several pictures; the best is "Bell Harry Tower," Canterbury. C. Court Cole deserves the bronze medal for his work, which is exquisite; we should have thought a silver medal might have been given to him, and a bronze to some other exhibitor; there is certainly work in the class deserving of recognition. S. G. B. Wollaston has some very careful work quite up to bronze medal standard. E. M. Tunstall contributes good work, especially "Choir Screen, Chester."

In the Architectural Class, XIV., 8 by 5 pictures and under, G. E. Thompson takes a bronze medal for his frame 589, "Treves Cathedral Porch," "Pont Auderner," "St. Castor, Coblenz," and "Perseus, Florence." W. L. Howie exhibits some charming studies of Nuremberg, and C. V. Shadbolt's studies at the Alhambra are worth close inspection.

The Scientific Class is a failure, and has only nine exhibitors. The class includes—Photo-micrographs, no entries; Astronomical, no entries; Geological, no entries; Botanical, some excellent photographs of "Rare Fungi," by S. G. B. Wollaston; Flower Studies, by Count Ritter von Stocker. The other pictures classed scientific are a pin-hole photograph by A. Buschbeck, time, 1 min. 40 sec., pinhole 4½ in. from plate; photographs of skeletons, monkey, badger, hawk, and gannet, by A. Robinson; tones and values of photographs of coloured objects, and four frames heliogravure process, C. Scolik; "Views Taken from a Balloon at an Altitude of 3,000 ft. above the Earth," C. V. Shadbolt, for which he was awarded a bronze medal; "High Mountain Views," M. de Soto, of no great interest; twelve frames of heliogravure process, R. Paulussen, very fine

work, for which he got a silver medal; "Pages from the Book of Kells," Greenwood Pim, makes up a full list of the work contributed to this class. We cannot help calling scientific photography, as shown at Liverpool, a failure.

We have already referred to the Flash-light Photographs of the Countess Loredana, which we must repeat are excellent. Those exhibited by F. Downer of "Professor Herkomer as Filipe" are very good indeed. Still, in this class there are only five exhibitors; we should have thought there might have been fifty.

In the Genre Class, XVI., there is some fairly good work, and no one will deny that S. N. Bhedwar deserves a silver medal for "Two's Company." We were pleased with H. Dudley Arnott's picture "A Drink by the Way," and E. Lloyd Edwards' "Arranging the Day's Sport." W. J. Anckorn's picture is forced and unnatural. "The Solo," J. E. Dumont, was recently contributed to one of the AMATEUR PHOTOGRAPHER Monthly Competitions, but did not then, nor does it now, strike us as having any special merit. "The Invalid and his Pets," C. S. Cobb, another picture contributed to the AMATEUR PHOTOGRAPHER competitions, we like much better. "His Sunday Boots," E. B. Wain, shows some care in composition, and so with many others, simple pictures telling a simple story.

The Enlargements are many of them very good. A. R. Dresser has a good picture in a "Misty Morning." Fred Anyon shows care in his enlargement of "Eventide." C. W. Huson has been awarded a bronze medal for his picture "Early Morning." Albert Chancellor again shows his "Balloon and Parachute" photograph, which is really clever, but does not seem to find favour amongst photographic judges. The proper class, of course, to enter the picture in is "Instantaneous," and to send a print from the *original* negative. "Portrait of a Child," Clarence James, is very fine; so is a "Portrait of a Lady," W. Crooke. There are many others showing real merit.

In the Stereoscopic Transparencies class we are surprised to find so few entries. We note that a silver medal is awarded H. J. Houghton, but had not an opportunity of examining any of the pictures. The other exhibitors are A. F. Stanistreet, H. G. Ridgway, A. Hamilton, J. E. Ellam, Leigh Phillips, and T. S. Mayne, all well-known works in stereography.

...There were a large number of Lantern Slides, and these we cannot attempt to comment upon. Most of them, as we saw them, appear to be very good. G. E. Thompson, who takes the silver medal, is a splendid worker. The bronze medallists are J. Carpenter, flower studies, beautiful, and beyond praise; F. Anyon, Derbyshire views, well chosen; W. L. Howie, Nuremburg and Ober-Ammergau, the most perfect technical work we have seen. A silver medal goes to Priestley and Sons for a fine yacht series. J. W. Wade has a bronze medal for "Coming Storm," "Toilers of the Sea," "Outward Bound," etc., all good work. F. W. Anyon has another bronze medal for cloud effects, etc., etc., which are all up to medal standard.

Several medals are given for hand-camera work, general photography, etc.

The general teaching of the Exhibition is that a very considerable number of prominent workers, especially amateurs, have abstained from sending in pictures; that although there is much good work there is much that is only of very ordinary quality. The exhibits show practically no advance in culture or art, they are so nearly all of one standard. The photographs are all shown to the best advantage, well lighted, not crowded; but still it must be admitted that the standard is low. We should like to know why the pictures of our prominent workers are conspicuous by their absence. In these days of leagues and combinations,

we trust that the best photographers have not formed themselves into a non-exhibition guild. We must admit that upon closely examining the Liverpool catalogue it looks very like it. We venture to think that at no exhibition ever held, or likely to be held, could photographs be exhibited under more advantageous circumstances. The exhibition is and has been an enormous success, but it is disappointing to us to record that the standard of work is far from high, due in a great measure to the holding aloof of prominent workers. As a consequence the awards made by the judges have gone to work which might have been surpassed by those who abstained from exhibiting.

It would be interesting to be "in the know" in this matter. Were the conditions too onerous? should classes have been for amateurs only and for professionals only? The Executive, we know, did their utmost in framing rules and conditions to please all, and we venture to think that they deserved support from many professionals and amateur photographers who did not exhibit.

## Letters to the Editor.

### PHOTOGRAPHY IN NATURAL COLOURS.

SIR,—Your correspondents "Farbenlehre" and F. W. Stow both admit colour to be subjective, but they do not appear to perceive the significance of their admission. The subjectivity of a phenomenon means that it has no existence outside of the subject. How that which has no existence can be photographed passes my comprehension.

That colours can be produced by various mechanical means no one could be ignorant or foolish enough to deny; but that gives no ground whatever for supposing that they can be reproduced by photography. Photography, as I understand it, is merely a method of measuring the actinic values of reflected rays of light, and if as the result of this measurement a fac-simile, more or less correct, of phenomena is set up, it does not, and cannot, reproduce them as they manifest themselves to our senses, because our senses take cognizance of more than mere actinism. The observations of your correspondents therefore appear to me to be altogether beside the mark.

That animal eyes may perceive colour in some degree the same as our own is highly probable, because we are natural products of evolution produced through a long line of animal progenitors, and, therefore, our eyes differ in degree, not in kind, to those of animals. But to suppose that their eyes see exactly as ours do is as absurd as to suppose that their brains reason exactly as ours do. When "Farbenlehre" asks me why a bull hates bright red, I retort by asking him how he knows that a bull does? It is simply one of those popular fancies which go to enliven our existence. If the number of people charged by bulls when dressed in red could be ascertained, it would be found to bear precisely the same proportion to the whole number of people charged, as the proportion of people who wear red bears to the whole population. I have been charged by bulls many times, but I never had a stitch of red about me. I have also been charged by elephants, rhinoceroses, buffaloes, lions, leopards, and other animals, but I am quite sure the colour of my shirt had nothing to do with it. "Farbenlehre" might have found much more plausible illustrations among the phenomenon known to naturalists as "imitation."

It is many years since I studied the phenomena of light, and I do not feel myself at the present time competent to discuss them. But I may be permitted to say that it seems to me that interference can only affect the colours of the solar spectrum. But there are in nature hundreds of colours that are not in the solar spectrum, and cannot be produced by any combination of its colours. If I am right in this, the writer of the article in your last issue is certainly wrong in ascribing to interference the colouring of a sunset. Has he ever seen one about the tropic of Cancer? I have seen hundreds of colours in a sunset that I do not believe could be produced by any combination of the prismatic colours. Or did he ever see the morning and evening glows

in the southern hemisphere said to have been caused by the dust of Krakatoa?

It seems to me that there is too great a tendency to accept without question anything and everything if put forward by a scientific man, clothed in learned phraseology, smothered in obscurity, and concealed in profundity. Some of the learned disquisitions we read (*teste* Koch) almost make one exclaim with Pope—

"See, still thy own, the heavy cannon roll,  
And metaphysic smokes involve the pole.  
For thee we dim the eyes and stuff the head  
With all such reading as was never read;  
For thee explain a thing till all men doubt it,  
And write about it, goddess, and about it;  
So spins the silkworm small its slender store,  
And labours till it clouds itself all o'er."

—*The Dunciad*.

I venture to prophesy, disregarding the adage, that M. Lippmann's discovery, so far as it is called photography in colours, will be relegated to the limbo of forgotten things with all those that have preceded it. I do not wish to be misunderstood. I am no supporter of the argument from experience, and regard it, indeed, as entirely fallacious. For as all things are a becoming, I consider that which is newest, for that very reason, most likely to be truest. Nevertheless, as there are fundamental limits to human knowledge, so there are fundamental limits to physical possibilities.—Yours, etc.,  
G. LACY.

P.S.—Since writing the above I have come across a curious and unexpected corroboration of my contention as to the subjectivity of colour. Casati, in his "Ten Years in Equatoria" (vol. i. p. 249), tells us of the inhabitants of the Welle-Makna region—those Niam-Niams and Mombottus first introduced to our knowledge by Schweinfurth, who though cannibals have comparatively high perceptions of art—that their eyes, though absolutely perfect as far as acuteness is concerned, receive the impressions of three colours only, white, black, and red. And yet we are asked to believe that the eyes of some inorganic substances receive more impressions than those of these highly organised beings!

#### A PLEA FOR YOUNG AMATEURS.

SIR,—I was pleased to see the letter of A. C. C. in your last issue, which I think can be fully endorsed.

I, like your correspondent, am a member of a photographic society, and therefore feel that any way by which a young amateur can gain attention is most sadly wanted.

I would suggest that a beginners' class should be made in all photographic exhibitions, open to amateurs only of say two or even three years' standing. A tyro is very much handicapped by amateurs who have perhaps practised in photography for upwards of twenty years or more. It shows most clearly that an amateur of even three or four years' standing has no chance whatever of being recognised in such competition.

If medals of small value were awarded, it would be a very strong inducement for beginners to join the societies, and after gaining a prize, to push themselves on to further honours. A young amateur only wants the chance to get started, then he himself is to blame if he does not succeed.

If the committees of forthcoming exhibitions will give this their careful consideration, I venture to think that they will see that something is really needed.—Yours truly, A BEGINNER.

\* \* \* \*

#### HYDROQUINONE DEVELOPMENT.

SIR,—Will you allow me a few lines of your space in order to compare notes with other workers, or perhaps profit by your editorial advice.

I have been working at photography for about eighteen months, and think the time has come when I should like to be able to develop in a rather less haphazard manner than I am afraid I do at present.

I have read a good many articles on the subject, including Mr. Lyonel Clark's book, but they all deal chiefly, if not entirely, with pyro development; and for certain reasons, principally a love for clean fingers, I always use hydroquinone.

Now, it seems to me that the rule laid down, that slow development tends to hardness, while quick development tends to flatness, does not hold good with hydroquinone. Certainly I find that in developing bromide paper, which is all the practice one can get in the winter, the contrary is the case. If I use a strong

developer I get the shadows black before the fainter details show up at all; while if I use a weaker developer, or if I pour off the developer when the picture is half out, I find that the light details continue to come out while the shadows do not gain much in density. I find that much the same rule obtains with negatives, viz., that by using a weak (diluted) developer I can get a soft negative, and by using a strong one a "plucky" negative. This does not, however, solve my difficulty, which is how to overcome the violent contrasts of an under-exposed plate or the weakness of an over-exposed one. If I use a diluted developer to the latter, it comes out too soft; if a strong one, it runs away with one altogether. I begin to fear that the matter may be summed up by saying that, with hydroquinone at any rate, an under-exposed plate remains an under-exposed plate, and an over-exposed plate an over-exposed one, and that the only choice lies between a soft or a plucky negative, but I hope very much that you or some of your correspondents will enlighten me on the subject. I may say I use Ilford plates and paper, and make up my developer according to the Ilford formula. I believe I am right in saying that the variation of the proportions of accelerator and developer has little or no effect in the case of hydroquinone.—Yours, etc.,  
E. A. D.

\* \* \* \*

#### THE NEW YORK MAY EXHIBITION.

SIR,—It will be of interest, perhaps, to all amateurs and other photographers to know that arrangements are now in progress for a very large, select, and important exhibition of photographs, including specimens of the best foreign work, to be held in New York, at the Fifth Avenue Art Galleries, between 34th and 35th Streets, May 25th to June 6th, under the auspices of the Society of Amateur Photographers of New York.

It will be the fourth of the joint series of exhibitions undertaken with the aid of the Photographic Society of Philadelphia and the Boston Camera Club.

The prospectus and entry forms have already been sent out, and the judges selected are Thomas Moran, Will. H. Low, and Edward Bierstadt, men well known in the respective branches of art which they represent.

Medals are to be awarded instead of diplomas, the number being limited to twenty-five. Exhibitions of slides will be held four nights during each week, and in a separate room there will be an exhibit of new and novel apparatus.

Foreign exhibitors may send pictures unmounted, which will be mounted and framed by the Committee.

Exhibits should be sent to the Galleries by May 11th, to ensure attention. The Committee prefers that the very choicest work be sent, rather than a large quantity of ordinary pictures.

Exhibits are invited from all photographers, and when received will be carefully attended to. Entry forms will be sent on application, and all correspondence should be addressed to

F. C. BEACH

(Chairman of Committee of Arrangements).

113, West 38th Street, New York.

**Crystal Palace National Photographic Exhibition**—Mr. S. G. Buchanan-Wollaston writes: "Arrangements are being made with a view to facilitate the transmission of Liverpool exhibits to us, by sending a representative to sort and overlook the pictures entered here, and to see to their speedy dispatch. We have already the promise of a great number of exhibits from Liverpool, including the wonderful flash-light pictures by the Countess Loredana da Porto Bonin."

**French for Amateur Photographers.**—Mr. D. Nutt, of 270, Strand, is just publishing a new edition of the "Colloquial French for Travellers," issued as one of the Phonetic Series. The arrangement of the book is easy to understand, and the method of giving the pronunciation excellent. The new edition will contain no less than eight pages of phrases useful, and, in fact, necessary to the amateur who has not had the time or opportunity to make a study of the language. There are also several pages devoted to the wants of cyclists.

**Sensitising Photo-litho Paper.**—Herr Ad. Franz uses the following bath for the above purpose:—

Bichromate of potash...	...	...	40 grammes.
Sulphate of manganese	...	...	5 "
Water	...	...	1,000 "

The sensitiveness of the paper is increased by the addition of the manganese salt, and the washing away of the ink from the exposed parts is prevented also.—*Eder's Jahrbuch*.

## Composition, and Light and Shade.

*Selected and arranged for the use of Photographers, from "Burnet's Essays," with Introduction and Notes.*

By H. P. ROBINSON.

### CHAPTER VII.

*Fig. 14.*—We have the strongest light coming in contact with the strong dark in the most cutting manner, in the knee and leg of the falling figure. When this can be done without interfering with the breadth of light, it is of the greatest consequence, both on account of its giving a thickness or rotundity to the group, and also because it enables us to keep the most projecting points and the most retiring in their proper places by analogy to one another. I am aware that the management of light and shade often requires a sacrifice of this principle; where we can accomplish our object without such a sacrifice it has always the most natural appearance. Many accidental combinations and beautiful effects of nature arise, not merely from their possessing a good general form and a pictorial arrangement

FIG. 14.—TERBERG.

of light and shade, but also from the most projecting points being often assisted by a combination of a harsh cutting line, strong dark and light, or opposition of local colour, and they strike the artist as being applicable to painting; these being the means he finds frequently adopted by the best masters. It is only under such favourable circumstances that the artist can enter the lists with nature; and, having but a flat surface to work upon, he is warranted in availing himself of every assistance science can afford. In arranging objects scientifically, to give them at the same time the appearance of natural accident, is one of the perfections of the art.

As the best practical hints are derived from accidental combinations in nature, whose sudden changes prevent the possibility of sketching, the mind ought to be trained to the most regular and even mechanical mode of arranging the ideas; that in an instant we may be able to determine whether the effects, which we perceive, depend upon a particular form, upon particular arrangement of the light and shade, or upon the manner in which the hot and cold colours are brought in contact. By thus tracing effects to their proper causes, we secure the principal points as a sort of shorthand notes to guide and assist the memory. This practice will also open a road of communication between the eye and the operations of the mind, which neither a hasty sketch nor the most learned dissertation can, separately,

produce. At first it may seem more difficult than it really is; but a few trials will convince the student of its practicability, especially as the effects that strike him to be the most pictorial are generally the most simple.

The cards lying on the ground, in this subject, indicate the cause of the quarrel; and the figure entering from an adjoining apartment gives us a hint of the noise generally attending such brawls. As a moral is here introduced, I shall make a few remarks (otherwise irrelevant to the purpose) in this place. When a picture possesses a moral, it is certainly a great advantage, provided we are not disgusted by its vulgarity, as is the case in the representations of drunkenness, etc., in some of the Dutch school, or by affected sentiment, as in many of the present works of all the schools. The moral must also never injure the picture in its higher requisites. In the early ages, representations of vice were necessary as strong lessons of morality; but as mankind grew more enlightened, they were referred to books, not pictures, for improvement. Besides, an artist ought always to recollect, that he paints for the higher, not for the lower classes of men; and as his business is to convey pleasure, not pain, a little intercourse with society will convince him, that men in all ranks have often enough to vex them, or to produce a variance with their fellow creatures, without hanging up on their walls representations tending to increase either the one or the other feeling. The absence of these considerations in an artist (of which we see daily proofs) dooms his work to that neglect which he ascribes to the want of encouragement to the arts generally. Representations of tragical events also (though possessing a fine moral or sentiment) have received but little patronage in this country; whether it is that they are not suited to the character of the nation, who, though not averse to the representation of a tragedy on the stage, are unwilling to choose a constant companion from such a class, or that there are few of those connoisseurs whose feelings are completely absorbed in the contemplation of high art, is a question which this is not the proper place to discuss: the fact is, however, indisputable.

We have here another example of emphasis. The points our author intended to bring out are scarcely sufficiently visible in the illustration, but will be easily understood when taken with the text.

Burnet here alludes to that which distinguishes art from accident, that is, the systematic arrangement of objects to give them the appearance of nature. Here we have a subject on which photographers differ. Some hold that no arranged figure, however well done, can be natural. It is useless to dress and arrange figures in a landscape so well as to completely deceive them. When it is explained to them how the thing was done, but not before, they immediately recognise the deception, and prophecy after they know but refuse to see the art; just as after they are told a photograph is produced from more than one negative they are able to find the joins (often in the wrong places) and condemn it accordingly. Criticism from knowledge is to be approved, but it should be the knowledge of an assured expert, and not the wild guesses deduced from second-hand information. Imitational criticism may also be wrong. A critic may be original and wrong, but imitations of original and wrong criticisms may be worse. Coleridge says, "To admire on principle is the only way to imitate without loss of originality," but it depends on the soundness of the principle.

On the other hand, students of art cannot admit that there is any art in snap-shot photography. If a picturesque group is met with accidentally and secured by the hand-cameraist, where is the art of the photographer who had nothing to do with the arrangement of the group? This may be true, but it is certain that the man who knows what is good composition will be able to recognise the materials for a good picture better than the ignorant opportunist who knows nothing of art and mistakes what he mis-calls truth to nature as that mystery.

In his second paragraph Burnet hits upon the true reason why a knowledge of composition is of so much value to the photo-

grapher. Nothing in photography can compare in value with the faculty of instantly recognising a subject in nature that will make a picture, and knowing as it were instinctively what should be added or omitted. This knowledge, so like instinct, can only be attained by a careful study of the quantities that go to the making of a picture, and practice. There is no substitute. Some have good taste, which is a very vague term. A photographer with taste only will hesitate so long in endeavouring to satisfy that indefinite quality by altering the point of sight perhaps, or worrying his models, or his cows, or his sheep, until they are either tired in the one case, or frightened away altogether in the other, but the man who knows his business—that is what constitutes a picture—would seldom lose a subject from such blundering causes.

In the last paragraph will be found some admirable observations on subjects for art. Summed up shortly, the picture is all the better for possessing a moral, but the moral must not interfere with art qualities, and miserable and painful subjects are not in good taste.

(To be continued.)

## Photography in Natural Colours.

In the new volume of Eder's "Jahrbuch" an interesting article appears on p. 294 *et seq.*, on "Die Entstehung der Farben in der Photochromie," by Dr. W. Zenker, of Berlin, the author of a "Lehrbuche der Photochromie," 1868, in which, after reviewing briefly the work of Becquerel, Niepce, Poitevin, etc., he points out that Becquerel's prints were only relatively correct as to colour, since the tints were produced upon a brownish-red background, but that if the spectrum itself was thrown on to the same support, it was at once seen that the colours of the results obtained were good. Zenker also points out that the images of painted reproductions of the spectrum are open to considerable exception, for he says—

"Where two colours act on the same point, one will perhaps appear quicker, the other more slowly and weaker, so that, for instance, a green light composed of yellow and blue lights will be reproduced as blue, and just the same in similar cases. It is therefore evident how much more advantageously one may work, in experimenting in photochromy, with the natural spectrum, than with painted originals, since the colours of the latter are compound, those of the spectrum, on the other hand, only simple."

Dr. Zenker then goes on to consider the theoretical explanation of the transmission of light and the formation of colours, giving a table of the wave lengths of the principal lines in the spectrum, and says—

"The height of the waves or the amplitude of the vibrations have up to now not been determined as to their actual size. They are, however, immeasurably small in comparison with the wave-lengths; on the other hand, one can very well reckon their relative size. Thus one knows that the intensity of two equal coloured rays of light is proportional to the squares of their amplitudes, and to these intensities under otherwise equal conditions correspond also the chemical actions. The procedure, when a ray of light exerts a chemical action on a substance, is explained by the idea that the quivering movement of the particles of luminiferous ether contained in the substance is transferred to the particles of the mass of the substance, and tears them one from the other or drives them together. We find, therefore, combination of the elements produced by light (mixtures of chlorine and hydrogen explode in sunlight, and are combined into hydrochloric acid), as well also as a splitting up, and this especially with the compounds of silver. Thus silver chloride  $2(\text{AgCl})$  is first split up into silver subchloride  $\text{Ag}_2\text{Cl}$  and chlorine  $\text{Cl}$ . From the silver subchloride, however, by the further action of light, the silver is separated in a metallic state. This can, moreover, be in many cases of a dark nature, in others of a bright mirror-like surface (*e.g.*, in glass silvering)."

Dr. Zenker then gives an explanation of the phenomenon of "interference," caused by the reflection of the waves of light from the surface of the silvered plate, just as M. Lippmann utilised the same principle in his experiments as explained in the precis of the article by M. Ch. Gravier on pp. 163, 164, March 6th, and as hinted at in the letter from Mr. D. G. Gordon in last week's issue, p. 183. It is interesting to note that this explanation of the obtention of colours by the phenomenon of interference was given before Lippmann had obtained his results, as the MSS. of

Dr. Zenker's article was in the editor's hands by November 1st, 1890, and the writer states that although the alternation of the points of quiescence and the maxima was clearly established in theory, the quiescent or stagnant waves had only been experimentally proved by the work of Dr. Wiener, of Berlin, who had actually photographed them.—Wiedemann's "Annalen der Physik und Chemie," vol. xl, 1890, p. 203, *et seq.* Dr. Zenker continues:—

"Before a silver mirror, on which the rays of light fall perpendicularly, must naturally the points of quiescence and maximum be formed as planes of quiescence and maxima, and the distance from one maximum plane to the next must amount to half a wave-length of the light ray. The first thing which Wiener required was now a monochromatic and chemically active light, and he says, 'The sodium flame could not be used, since this even with a long duration of exposure does not noticeably act on collodio-chloride of silver. On the other hand, the light of an electric arc lamp proved to be approximately homogeneous in a remarkable manner. This is to be attributed to the fact that it emits in special intensity the violet rays which are the most energetic in acting photographically on the collodio-chloride of silver, and the wave-length of these active rays is tolerably closely defined; with this, indeed, the absorption of the ultra-violet rays by the glass plate must still be taken into account.' In order now to photographically fix the alternating quiescent and maximum planes which must be formed before the mirror, Wiener placed a collodio-chloride of silver film, spread upon a plane glass in front of the mirror plane that it had about as minimum a distance on the one side as the other, it must therefore alternately intersect quiescent and maximum planes. It was so thin that its thickness scarcely amounted to one-tenth of the distance of two maximum planes, indeed only about one-thirtieth of the wave-length of the sodium light. Wiener describes the preparation of the collodion film in the following way: 'There is in the market chloride of silver collodion (Schippang and Co., Berlin), in separate solutions, one of which contains only the silver, the other the chloride salts. Small and equal quantities of each are taken and both diluted 15 to 20 times with a mixture of equal parts of alcohol and ether. Then the diluted solutions are mixed together in the dark-room. Of the liquid thus prepared, one places a couple of drops on a plate of glass. The solvent quickly evaporates and leaves behind on the plate a fine film. In order to give this as much as possible an equal thickness throughout, one uses with advantage a little dodge. One takes a second glass plate of about the same size. After one has poured a few drops of the solution on it, one covers the other plate over it, so that the liquid spreads itself out between the two plates by capillary attraction. If the space is completely filled up, the plates are drawn quickly apart, the upper one turned over and laid down horizontal. After evaporation of the solvent there remains on the glass plate almost everywhere an equally thick film. The film is absolutely transparent, has the thickness (in a test case) of 20 tenth metrets, equal to one-thirtieth of the wave length of the sodium light, and in spite of such fineness it possesses a light sensitiveness quite sufficient for the experiment. After an exposure of one to two minutes, the plates were taken apart and developed. There showed then in the negative images on them, where the film had intersected the planes of quiescence, clear stripes; where they had cut through the maxima planes, dark stripes, both in frequently occurring alternation, corresponding to the theory of the stagnant waves."

"It is proved by this that the chemical action is wanting in the points of rest of the stagnant wave system, whilst it takes place vigorously in the maximum points; thus it is to be expected that in the action of a monochromatic ray of light on a silver mirror covered with silver subchloride the silver subchloride would remain unchanged at the points of quiescence, and, on the other hand, that metallic silver would be separated out by the disruption of the elements silver and chlorine. There were thus formed within the dark mass of the silver subchloride films of separated silver particles which stood at a distance from one another, equal to half a wave length of the acting light ray—and this suffices to again well discern in incident white light the same colour which the acting ray had. For it is well known that in white light the same ray is contained which had previously acted: it finds a system of films of bright particles of silver, and the films at a distance of half a wave length from one another. The rays reflecting from the two film points following one after the other have, therefore, always a whole wave length difference of course. They will thus always give the same impulse to the eye, that is to say, such as acts for every particle of the retina at the same moment in the same way. Of such waves one says, that they are in equal phase, that is to say they attain simultaneously the position of rest, the upper and lower turning point of their vibrations and their actions therefore are added together. But what happens to the other rays of white light, whose wave length is greater or smaller than that of the acting rays? For the shorter the difference of path of

the rays reflected from two film points following one after the other must be greater than a wave length; therefore they will not be reflected in corresponding phase; where with the one the vibrations still increase, with the other they descend and *vice versa*. Therefore they will be reciprocally weakened and with a suitable number of reflecting films will be completely quenched. The same takes place for all rays whose wave lengths are greater than the acting ray. For here the difference of path amounts each time to somewhat less than a whole wave length and on account of the difference of phase thus produced must the individual rays also be quenched. The same will occur with all the coloured rays, which are contained in white light, only those will be vigorously seen under whose action the film points were formed. *One will thus see everywhere the identical colour.*

"If the reproduction of any simple colour is explained in this way, it naturally follows of the compound colours; for with these for every constituent colour must a special system of stagnant waves and film points be formed. The compound colour, in which all the rays of the visible spectrum are combined, is *white*. This is also reproduced as white; still only when the ultra violet has not acted with the illuminating colour. If this is the case, there appears the actual colour of the ultra violet which under ordinary circumstances is invisible, the lavender grey, as Helmholtz has called it. If one wishes, therefore, to print in sunlight a coloured transparent painting by laying it on a prepared photochromatic plate, one only obtains the white places as white when one inserts in the course of the solar rays a transparent substance which holds back the ultra violet rays of the solar spectrum. For this purpose is specially suitable a solution of bisulphate of quinine acidulated with a few drops of sulphuric acid; still, uranium plates also appear to act sufficiently energetic. The remaining colours also appear pure only with the use of such a screen, if one wishes to produce them through a transparency in sunlight, whilst this screen, on the other hand, is not requisite for working with the spectrum, since with this the ultra violet rays are widely separated from the visible colours."

Mr. D. G. Gordon, page 183 of our issue of the 13th inst. gives an idea of the method he is working with, and the results he hopes to attain, and we may, perhaps, assist him and other experimenters by drawing attention particularly to the latter part of Dr. Zenker's article on the suppression of the ultra-violet rays, and state that Dr. A. Miethe has recommended for this purpose the following special screens:—

(1)					
Gelatine	..	..	..	..	2 grammes.
Glycerine	..	..	..	..	2 "
Water	..	..	..	..	25 cc.m.
Æsculin	..	..	..	..	0.03 grammes.

The mixture is dissolved by the aid of a gentle heat, filtered and plates coated with the same, and stood in a place free from dust to dry.

(2)					
Gelatine	..	..	..	..	2 grammes.
Glycerine	..	..	..	..	2 "
Water	..	..	..	..	25 cc.m.
Fluorescein	..	..	..	..	0.02 grammes.

The solution is made as above, and plates coated with the mixture. The coated plates are laid film to film and clipped together at the edges. The addition of glycerine keeps the films somewhat damp, and they therefore retain their special properties longer, and Dr. Eder states that a trace of soda added to the solution of fluorescein also improves this property. The æsculin plate gradually becomes brown in the light, and therefore requires renewing. The cause of Mr. Gordon's failure with the ordinary film is probably due to the ordinary film being a great deal too coarse and opaque, and too thick. There is not the slightest doubt that a silvered copper plate such as the old daguerreotype plate coated with an extremely thin film of collodion or gelatine emulsion would reproduce the colours excellently. The collodion emulsion as indicated by Wiener above might be employed, and Lippmann states that a suitable gelatino-bromide film might be obtained by dissolving 10 grammes of bromide of potassium in 100 cc.m. of water with a little gelatine, flowing this over a glass plate and allowing to set and dry, then dipping it for five minutes into a 20 per cent. solution of nitrate of silver acidulated with acetic acid, then washing and drying. Development might be effected with a developer compounded after Taupenot's formula, for which three solutions are required, viz.,—a 10 per cent. solution of carbonate of ammonia, an 8 per cent. solution of bromide of potash, and a 10 per cent. solution of pyrogallol—7 cc. of the ammonia, 6 drops of bromide, and 6 to 10

drops of the pyro with a suitable quantity of water. After development the plate should be well washed, flooded with solution of salt, and fixed. Becquerel stated (see AMATEUR PHOTOGRAPHER, page 147) that he had noticed the electrical disturbance produced by the action of light; still, this should not prevent Mr. Gordon from doing the same.

With regard to the cost of an apparatus such as figured in our issue of March 6th, it need not be very great; a small electric light may be obtained for 15s., cell for the heat rays absorbent for 1s. 6d., a prism for 8s. 6d., and another cell for the light filter for the same price as before, the only requisite then being a slit to admit a very narrow ray of light, and we have had one made for us by a working optician for 2s. 6d., and every amateur has a lens and camera.

## Our Contemporaries.

The *Photographic Times*, in an article by Adelaide Skeel, says—"A druggist advises me never to buy the oxalate of potash, owing to the difficulty of getting a pure sample, but to make it according to the following recipe, using a large open dish on account of the amazingly great expensiveness of the solution, when, by adding acid to the carbonate, large volumes of carbonic acid are evolved:

Water	..	..	..	..	60 ounces.
Carbonate of potash	..	..	..	..	12 "
Oxalic acid	..	..	..	..	12 "

Dissolve acid and add slowly to potash, making the solution neutral first, and then acid. Supposing, however, that one has a pure sample of oxalate dissolved in the right proportion for platinotype prints, it is only necessary, as said before, to double the amount usually added to the iron for bromides. At first I acidified it with a few drops of acetic acid, but not being able to see any difference in the pictures thus developed, and those developed later, without the addition of the acid, I decided it was not necessary, and this conclusion led me to try the bold experiment of also omitting the acetic acid triple bath when the acid hypo was used as a fixer. Believing that everything which can be left undone should be, I was charmed to see the prints come out free from yellow stains without acidifying it. Of course, it is reasonable to know that hypo with acid in it will clear as well as acid first, and then hypo; but it is satisfying to make sure."

*Anthony's Photographic Bulletin* gives the following method of obtaining brown and reddish tones on bromide prints published by Dr. Stolze. He uses for the first development:

Solution No. 1.					
Sodium sulphite	..	..	..	..	10 parts.
Eikonogen	..	..	..	..	2 "
Distilled water	..	..	..	..	150 "
Solution No. 2.					
Carbonate of potash	..	..	..	..	25 parts.
Distilled water	..	..	..	..	150 "

For normal negatives mix 25 parts of No. 1 with 10 parts of No. 2, and from 75 to 90 parts distilled water. For over-timed negatives more, and for under-timed negatives less of No. 1 is used. The temperature should be about 60 deg. Fah. In full exposures, bromide of potassium should be added—this treatment produces beautiful tones of a slightly yellowish-brown colour, to change which into brown or reddish colour it is necessary to transform the image into bromide of silver, and re-develop as follows:

Solution A.					
Sulphate of copper	..	..	..	..	1 part.
Distilled water	..	..	..	..	100 parts.
Solution B.					
Potassium bromide	..	..	..	..	1 part.
Distilled water	..	..	..	..	100 parts.

These two solutions are mixed and the print bleached therein, after which they are thoroughly washed to eliminate as much as possible the copper, and treated with the eikonogen developer first used, in the following proportion:

Solution No. 1	..	..	..	..	50 parts.
" No. 2	..	..	..	..	20 "
Diluted water	..	..	..	..	4930 "

The prints will undergo all the changes of tone from vivid red chalk to deep violet black, and may be stopped at any desired tone by immersing in a bath of citric acid, 1 to 100 of water, after which they should be washed and dried. The intensity and detail obtainable depend largely on the second development, which brings out much more than is apparent after the first, and the process is therefore highly commended as an intensifying agent, both for bromide and for negatives as well.

*Wilson's Photographic Magazine* gives the following:—"You will in time be puzzled to know how best to keep and classify your rapidly accumulating negatives. I have adopted what I term the envelope plan. I do not know that there is much originality in this with me, but I find it very effective and convenient. For each negative I select a stout envelope, somewhat larger than the negative, and on one side of it I write the name of the subject and all necessary information. This ordinarily might be sufficient, but when there are several negatives of the same subject, it would be often confusing to tell just which was the one wished. I have, therefore, adopted the plan of making a blue print of each negative and pasting it on the other side of the envelope. I am thus enabled at a glance to tell just what the negative is and all about it, without removing it from the envelope. The matter of making the blue prints is a simple one. I take an ordinary drawing-board, cover it with a piece of felt, upon which I place my paper and arrange the negatives on top of that, and simply guess at my exposure. It is well to consider the density of the negatives when arranging them for printing, and print those of uniform density together. Waste silver prints can, of course, be used for the same purpose, if you happen to have any that are not entirely spoiled. The sheets, after printing, are simply cut up and pasted on the envelopes."

The *St. Louis and Canadian Photographer* says—"The best negatives for bromide printing are those full of detail without excessive density or too much clear glass; a slightly over-exposed plate, developed with one-half or two thirds the proper quantity of pyro, and the development stopped the moment all detail is out, is to my mind the proper way of arriving at a perfect negative for bromide printing, and this is what I mean by a 'normal' negative. Such a negative, when exposed for the proper time, will give a perfect bromide print with the normal developer mentioned hereafter, and will require no dodging of the lighting or alteration of the developer in any particular."

## Notes for Novices.

### CHOICE OF PLATES AND DEVELOPER.

THE choice of a dry plate is always more or less an important and anxious subject for a novice. He perhaps is fortunate enough to know some more advanced worker who always uses one particular brand, and this brand is strongly recommended to him and is therefore used at first. Then, perhaps, our novice sees a statement in some journal that some well-known prize-winner has just taken a prize against all comers for a view taken on Messrs. Silver and Bromide's plates. He immediately adopts this brand, and is disgusted to find he can get no better artistic results than before; some plates frill, others fog, and in despair he sets to work to read the advertisements of all the plate makers, and he decides to give each a trial. The moment he does this he's lost; he may, by chance, turn out a fairly decent-looking negative, but it is more by luck than skill. And should he chop and change about with developers for the same reasons, it is utterly impossible for him to turn out a decent negative when he wants to. There are no two plates in the market which require exactly the same treatment, no two developers which require exactly the same modification. Choose one brand of plate, and either use the developer recommended by the makers or else a formula which you know some successful worker of that plate uses with good results; then *stick to your one brand of plate and one formula of developer*, till you have learnt what you can do with the plate and what the developer will do. Then if you like try a change, only try it in the same way—do not think for one moment that you are going to learn what a plate or developer can do from one box.

To choose a plate out of the many commercial brands is no easy task, to state the best plate is an utter impossibility for anyone; they are all good, and more, a great deal more, depends upon the man using the plate than the plate itself. Don't ask

impossibilities, that is to say, don't ask a plate to give you detail and gradation of tone when it is wrongly exposed and wrongly developed. Above all things, *never blame a plate for a fault until you are quite certain the fault is not yours*; and never take your own opinion on this point, send the faulty negatives, with a full statement of how you work, to some practised friend, or to the editor of your weekly journal. There is no bad commercial plate in the market, for the simple reason that the makers now know that their actual existence as such depends on sending out good stuff. Occasionally, but very occasionally, a stray odd dozen may be a bit faulty, but in such a case, that is if you have been convinced that it is not your fault, send the faulty negative and the box to the maker, and ask quietly and civilly as to whether under the circumstances it is their fault or yours. If they tell you that the plates are old and have deteriorated by keeping, then make sure next time you get fresh ones. There is not a plate in the market we have not used, and we have used a great many, and only twice have we ever had to find fault with the actual maker. Once we had a batch of plates which frilled slightly towards the centre, and showed a distinct line within which the frilling took place. On sending these back to the makers they immediately acknowledged that the plates had by some oversight been packed before the centres were absolutely bone dry, and sent us a fresh lot with apologies. The other case was that of three plates out of a dozen, which showed little black specks on the film surrounded by a comparatively clear circle which were due to dust settling on the film whilst wet. In the course of many years these are the only two cases we can call to mind of faults which might actually be ascribed to the maker; and when we meet with a fault which may or may not be ours or the maker's, we prefer to err on the right side and take the blame ourselves. We therefore strongly advise all to do the same, and blame their own stupidity and blundering before blaming other people.

All novices want to be told how to choose a plate. Well, for landscape work, one showing about 15 degs. on Warnerke's sensitometer is the most suitable, and one also containing iodide of silver, which may be known by the deeper colour of the emulsion. The presence of iodide of silver gives far greater latitude in exposure and in development. It is far better to use a slow plate and full aperture of the lens than a rapid plate and small aperture; the result is by no means the same, although precisely the same exposure be given. For instantaneous work we must choose our plates according to the time of year and character of work we are going to do; in the height of summer, for sea and river work, we may use a plate showing only 20 or 22 degs. without ill results, but for inland work where we are likely to meet with heavy masses of foliage or shadows it is advisable to use as rapid a plate as possible. For portraiture a very rapid plate is again desirable, so as to reduce the necessary exposure as much as possible. For line work or copying in black and white a very slow plate should be used, one which shows about 5 degs. Warnerke; special plates called "photo-mechanical" are prepared commercially, which, with care, will give equally good results as wet collodion, which is the process par excellence for giving clear glass lines. For copying oil paintings, coloured objects, and flowers, etc., colour-sensitive plates should be used, and these may also be used for portraiture, with good results, in cases where freckled, or light or auburn haired sitters are to be taken; and in the spring and autumn, too, these plates give superior results in ordinary landscape work, the difference in summer not being so noticeable.

## Thursday Evenings at the Camera Club.

BY ONE OF OUR STAFF.

THE new premises of the Club, or rather a good portion of them are now in usable condition. How delighted the members must be to get away from the old rooms, which, though answering their purpose admirably in the early days of the Club, have lately been found much too narrow for the growing numbers. The general room, in which the papers are read on Thursday evenings is a vast improvement on the old, low-ceiled, badly-ventilated room, which was often found incapable of holding all those who desired to be present. There is a cosy little dining-room, all corners, so that

everybody can get the seat he wants; and a well-stocked, quietly furnished library, in which conversation and smoking are strictly prohibited.

Major Nott took the chair at this the first meeting, and congratulated the members on entering into possession of their new premises. The usual course of procedure was then followed, and Mr. Davison brought to the notice of the meeting a "parallel trimmer," which was an ingenious apparatus to enable one to trim or cut down a print to any size desired.

The Rev. T. Perkins, a well-known and energetic member of the Club, was then called upon to give his paper, which he called "Further Notes on English Church Architecture." The reader made an apology, at commencing, for what he intimated would be the shortcomings of the paper, and explained that he was for some time confined to the house by a bad cold, and the remainder of the time was taken up by another matter which had nothing closer to do with church architecture than that it led to a ceremony interesting to himself, and one other in a modern ecclesiastical structure. There was an audible smile at this, as it was generally known that the reverend gentleman had recently taken on himself the bonds of matrimony. The reader dealt at considerable length with his subject, and devoted himself to what is perhaps the most interesting division—Anglo-Saxon churches—and prefaced his remarks by saying that he agreed very much with Com. C. E. Gladstone, but not on the point that interior work must necessarily be given up at the autumnal equinox, for he had found that snow on the ground was often useful in lighting up a dark roof. Leicestershire and Northamptonshire were rich in Saxon churches, and the geographical distribution of their churches was interesting and instructive. Britain was under the sway of the Romans in the first half of the fourth century, and under Constantine Christianity became the established religion of the empire. When the Romans afterwards abandoned Britain "the fierce heathen of the northern sea" drove Christianity into the west, where it remained till the sixth century, when it was reintroduced from Rome. There were several churches for which claims were made of having been built in the earlier time, and he was inclined to think that the church at Brixworth was built in the early Roman period. It might be that some of the churches for which the claim was made were originally built of wood, in the belief that the end of the world was near, and that when the critical date had passed people began to think it was worth while building of something more substantial, and so in the second period stone churches were built on the site of the wooden structures. There was a great similarity in the style of the existing Saxon churches, and if they were not built about the same time, the same style in architecture must have continued for about 500 years, which it had not done in any other case. The features of Saxon work were long and short work at the corners, the towers were more lofty than the Norman ones, and the buildings were high in proportion to their length and width; there were, as a rule, no aisles. From the days of the early Edwards, architecture was in a state of decay, but it could not be said to be dead until the time of the Stuarts and Hanoverians. Nowadays we saw pretty churches, but they were only bad imitations of an old style, and there was but little chance of going back to early architecture and making a new start from that point. We had plenty of engineers, but few artists; we could build bridges and ironclads, but we could not build a beautiful house. The best thing they could do, if they had reverence for the past, was to raise their voice on behalf of the preservation of these old buildings, and as photographers they might preserve records of the beauty which time, neglect, and ignorant restoration threatened to destroy. Architecture was a most interesting branch of the science, and there was much useful work to be done, and which must either be done at once or never done at all, for the restoring fiend was busily at work either knocking down buildings or scraping and patching them up into smugness more deplorable than their decay. To preserve records of these old buildings united action was necessary. The Camera Club was a body which could do that work admirably, in the way he had pointed out in the *Photographic Quarterly*.

A considerable number of slides were then passed through the lantern, the lecturer commenting upon them as they appeared, but there was not time to show the whole of the series, and, on the motion of the Chairman, the meeting was adjourned till the following Monday, on which day the reader promised to attend and complete the series.

## Exhibitions.

### LIVERPOOL INTERNATIONAL PHOTOGRAPHIES. No. III.

(By Our Special Correspondent.)

ANOTHER week's run has served to show increased interest in the big show at Liverpool. On an average the daily attendance must be nearly 2,000, figures which will be very largely added to during the Easter holidays. For several nights the two demonstration rooms, both being occupied at the same time, have been uncomfortably over-crowded, and even then all the visitors desirous of attending the lectures could not be accommodated. On busy nights three demonstration rooms could be filled. A series of capital musical recitals are being given daily, and are much enjoyed. For next Monday the executive have secured the Rotunda Lecture Hall, a large hall adjoining the Walker Gallery, where it is intended to give two lantern shows, "Iceland" and "Ober-Ammergau." The building will seat over 2,000 people, and there is every probability of it being crowded, as "Iceland" and "Ober-Ammergau" have proved extraordinary attractions. Altogether, the final week should be a record.

### PICTURES (CONTINUED).

Resuming the review of pictures, a very excellent section is found in Class X., 402 to 473, marine and cloud studies, any size, any process, set of four pictures. Thirty contributors make up this class, S. Bourne taking the silver award with 432 to 435, four scenes at Killarney; and Thomas Glazebrook the bronze medal with four cloud pictures, 407 to 410. The "winning eight" are very fine, and the awards have given general satisfaction. H. R. Marsden shows a nice quartette, 419 to 422, and Harry Symonds's yacht-racing studies, 424, are good. Carl Greger's cloud effects, 423, are excellent, but would be considerably improved if a little of the lower part were cut off. In 427 A. W. Gottlieb has a superb four which were nearly successful with the judges. D. Cunningham's 428 to 431 are artistic, and A. F. Stanistreet exhibits fine work in 438. Of 440 to 443, 441 is the best picture by F. D'Arces. H. Dudley Arnott's 451 to 454 are very fair. J. L. Mackrell has four lovely boat studies at Hoylake, 468. Manuel de Soto, Vice-Consulate d'Espagne, Zurich, is represented with sea and cloud studies, 444, nicely done. Miss Rose Collier's frame, 439, is exceedingly creditable.

In Class XI., 475 to 497—animals, from life, any size, any process, set of four pictures—there are thirteen exhibitors. F. M. Sutcliffe shows good work in 475 to 478, 477 being perhaps the best study. Charles Reid, the well-known worker in this branch, takes the silver medal with 485, "Highland Cattle, Ewes and Lambs, Fox Hounds, Mares and Foals." Each of this four is clever and exceedingly well finished. H. Herbert, 486 to 489, shows his best picture in 486, and D. Hedges and Son in 496a of 496a to 497. These latter frames are more than average in quality. J. Catto, of Australia, has fair pictures in 490 to 493.

Class XII., 498 to 517—groups, outdoor, any size, any process, set of four pictures is a small one—made up by eight exhibitors. Lyd Sawyer's "Near the Big Crane" (499) is good, but F. M. Sutcliffe deservedly gets a silver medal for 503 to 506, the two numbers mentioned being the pick of the four. No. 507, by Gaston Plessy (a youth under twenty years of age, it is stated), contains four really excellent subjects, well chosen and well executed. They are "Baby's Pap," "Women and the Secret" (La Fontaine's fable), "A Game of Cards," "The Big Brother's Birthday." F. Bremner is awarded the bronze medal for 508, group studies (instantaneous). Werner and Son (Alfred Werner) contribute aristocratic groups in 514 to 517. Young Plessy hails from Loiret, France.

A larger class and one in which there is much very fine work is Class XIII., 518 to 580c, architectural, interior or exterior; whole-plate and over; any process; set of four pictures. Twenty-one exhibitors compete, the bronze medal being awarded to C. Court Cole for 565 to 568. These embrace (1) "Christ Church Cathedral," date 1160 to 1180, showing Tudor vaulting, 1600; (2) "Divinity Chapel," 13th and 14th centuries, showing watching chamber of the saint Frideswide, 15th century, and old pulpit seat of Regius Professor of Divinity, and sometimes seat of Vice-Chancellor of the University; to the left, old carved coat-of-arms; (3) "Wolseley's Library, Queen's," date 1692 to 1694;

(4) Reredos, All Soul's, 15th century, restored by the late Sir Gilbert Scott, R.A. They are excellent work all through. George Bankart shows very good studies indeed in 530 to 533, as does Richard Keene in 547 to 550 (interiors of Osmaston Manor, the seat of Sir Andrew Barkeley Walker, Bart.); James Pinnington, in 551; Cyril S. Cobb, in 552 to 555; and George E. Thompson, in 560. There are several foreign exhibitors in this class.

Class XIV., 581 to 589—architectural, interior or exterior; 8 by 5 in. and under; any process; set of four pictures—contains studies by nine workers, George E. Thompson getting the award for 589, a splendid frame showing (1) "Treves Cathedral Porch;" (2) "Pont Auderner;" (3) "St. Castor, Coblenz;" and (4) "Perseus, Florence." Other excellent pictures are shown in 583, Cecil V. Shadbolt; and 587, W. H. Rock. As a whole there are about 300 pictures in the architectural section.

Coming to the scientific department, Class XV., 590 to 611, for photo-micrographs, astronomical, geological, and botanical work etc., a few unique studies are displayed. R. Paulussen (Vienna) gets the silver medal with 607, twelve frames heliogravure process. These are a splendid set. Cecil V. Shadbolt with 605, views taken from a balloon at various altitudes, one showing another in cloudland 3,000 ft. above the earth, takes the bronze medal. Chas. Scolik (Vienna) in 592 exhibits photo effects of different coloured objects, and portraits in costume and their respective tones and values. The same exhibitor in 592a shows four good frames, heliogravure. Manuel de Soto's high mountain views, 606, are excellent, as also are Count Robert Ritter von Stockert's (Vienna) flower studies 602 and 603, and Greenwood Pim's "Pages from the Book of Kells," 608 to 611.

Of the flash-light pictures, chiefly 612 to 634, those of the Countess Loredana da Porto Bonin, the Italian gold medallist, are unquestionably the finest and worth a visit themselves. They range from 623 to 634, and are titled as follows:—"Tossing for Drinks," "The Cobbler," "The Village School," "Politics," "The Future Professor," "The Country Kitchen," "A Stolen Kiss," "Gamblers," "Old Memories," "Training for the Choir," "The Corn, a Sore Spot," and "The Catechism."

"Here," said a judge, examining this superb dozen, "is the work of the Robinson of Italy."

Other notable studies in the same section are 612, by John Pasquali von Campostellato, some of which are taken inside Alpen huts; 614 and 616 of F. Downer's 614 to 617, "Professor Herkomer's Filippo;" and 618 to 621, by Albert Smith. The six pictures in frame No. 612 are exceptionally good in every way.

Shapoor N. Bhedwar takes the silver medal in Class XVI, 645 to 679, for a groups or figure studies to form the principal element of the picture; any size or process; one study only. The successful exhibit is one of much softness and brilliancy, called "Two's Company," and showing a lady figure in Eastern costume with what is presumably a pet bird.

However, there are several other very able pictures in the class, among which may be enumerated 649, "Lady Reading a Letter," by Joseph Chmielewski; 650, by W. J. Anckorn; 652, "Pleasant Pastimes," by Chas. A. Timmins; 664, "Mending Nets, Whitby," F. d'Arce; 666, "The Solo," by John E. Dumont; 671, "Flirtation," by H. McMichael; 672, W. J. Byrne; and 677, "The Good News," by Countess Loredana. Mrs. Jamie W. Hignett, 659, and Miss Lil W. Tomkinson, 675, also show good pictures; the former "He Cometh Not," and the latter "The Little Old Woman who had so many Children she didn't Know what to do."

Forty exhibitors competed in Class XVII, 680 to 720, enlargements; print to be untouched; any subject, size, or process; one study only. Chas. W. Huson gets the bronze medal with 685, "Early Morning," a very fine picture. W. Crooke also gets a similar award for 696, "Portrait of a Lady," another bit of good work. Among other prominent studies are 683, "Eventide," by Fred Anyon; 681, "Crucis Abbey, Berwyn," E. S. Gladstone; 690, "Young Girl Reading," Joseph Chmielewski; 692, "Portrait of Child," Clarence James; 694, "Making Crabpots," John Noakes; 695, "Watering the Horses," John Morrison, junr.; 698, "Tanyralt," G. A. Kenyon; 699, "Yachts Racing on Lake Windermere," H. Herbert; 709, "Tired Playmates," Edward A. Gollidge; 713, "Chain Bridge, Berwyn," Francis H. Glazebrook; and 716, "A Gnarled Oak," W. Tomkinson.

Two novel pictures are 684, by Gaston Plessy, and 686, by Albert Chancellor. Plessy shows "A Spider on its Web" (taken by magnesium flash-light and enlarged on Eastman paper), and Chancellor exhibits studies of "Captain Spencer with Balloon

and Parachute," balloon 70 ft. high, parachute, 2,000 ft. high.

"A Glimpse of Old Norwich," 708, by H. Dudley Arnott, is very fine.

#### APPARATUS (FIRST NOTICE).

Space this week will not allow of an extensive notice of the apparatus in the exhibition, and it will be dealt with in a subsequent issue of the AMATEUR PHOTOGRAPHER.

Altogether about twenty firms are included in the Trade Exhibitors, viz.:—Fry Manufacturing Co., London; Robinson and Thompson, Liverpool; A. and G. Taylor, Liverpool; Medrington's, Limited, Liverpool; Hannan and McIlveen, Gainsborough; Hauser Y. Meret, Madrid; William Hume, Edinburgh; Alfred Watkins, Hereford; James Thomson; J. J. Atkinson, Liverpool; James Wood, Liverpool; Birmingham Photographic Co., Limited; Wood Bros., London, Melbourne, Sydney and Liverpool; Archer and Sons, Liverpool; Sharp and Hitchmough, Liverpool; Alexander Watt; Wood (late Abraham), Liverpool; and T. Miller, Salford, Manchester.

## The Proposed Federation Scheme.

THE adjourned meeting convened by Mr. L. M. Biden was held at the rooms of the P. S. G. B. on Monday evening, the 23rd inst., at eight o'clock, Mr. Biden in the chair. Representatives were present from the Toynbee Camera Club, Harlesden and Willesden Photographic Society, Holborn Camera Club, North London Photographic Society, Sydenham Camera Club, Ealing Photographic Society, West London Society, North Middlesex Society, the People's Palace Photographic Club, and other societies, including Messrs. Bedford, Warnerke, and Addenbrooke, of the P. S. G. B.

The Chairman opened the meeting by announcing that he had received several letters on the subject of the advisability of federation, about a dozen societies being in favour of it, whilst other societies seemed to object unless the P. S. G. B. were at the head. Mr. Warnerke stated that he and his colleagues were appointed by the Council of the P. S. G. B. to report on the question only, but did not propose to take part in any way in the proceedings as representatives of that society.

Mr. Brocas (Holborn) said that he thought when the matter was brought forward last meeting that it was to take the form of a union to look after the interests of photographers in general, but he found it was an amalgamation of societies. The weak point about the matter appeared to him that there being a large number of earnest workers who were not bound to any society, provision should be made for their membership, his idea being that it would be better for individual members to form the union, and thus give the societies the option of sending more members in at a reduced fee.

The Chairman replied that the federation did not intend to accept individuals as members, or enter into competition with any societies.

Mr. Malby (Toynbee) spoke as to the necessity of combination of some sort, and thought it time that photographers (both amateur and professional) should accept the run of events and combine together for the better opportunity of securing for the societies united action, and thought that if such a union was formed, it would conduce greatly to the future welfare of the whole art of photography.

Mr. Addenbrooke said the Council of the P. S. G. B. was of opinion that the Society ought not to stir in the matter until an outside opinion had been expressed in favour of federation. They had now received requests from abroad; these came before the Council at the same time as Mr. Biden's communication, and Sir H. Trueman Wood, Mr. Warnerke, and himself were appointed a Committee to consider the matter. They were considering the Belgian scheme of amalgamation, the scheme under which the natural history societies were affiliated to the British Association, and other schemes; but it would take some time before they could report, and months would probably elapse before any action could be taken thereon.

Mr. Bedford spoke as to the necessity of federation, and was pleased that the matter had come forward. The only consideration before him was whether it was desirable to hurry the matter through while it was understood that the P. S. G. B.

was considering the matter. Would not the societies get more advantages if they came in under the scheme of the P. S. G. B.?

Mr. Brown (N. London) was in favour of federation, but would like before his Society was pledged to have a definite reply to the question, "Will the P. S. G. B. join the federation, or will it not?"

Mr. Warnerke said that after the Committee's report to the Council they would give a positive answer.

Mr. Mackie (N. London) said his Society were like the West London.

After various other gentlemen had given their views, the Chairman put the following resolution which had been proposed and seconded:—

"That it is desirable to form an association or federation of societies and clubs whose members are interested in photography,"

which was carried without dissent.

After considerable desultory conversation the draft constitution prepared by Mr. Biden was read. It was moved by Mr. Malby:

"That a Committee be appointed for the purpose of formulating a scheme and considering rules,"

which was carried.

The Committee were then elected as follows:—

Mr. Barrett (People's Palace), Mr. Biden (Toynbee), Mr. Brocas (Holborn), Mr. Cherry (North Middlesex), Mr. Edwards (South London), Mr. Rumble (Sydenham), Mr. White (Ealing). Mr. White (Ealing) moved:

"That the meeting be adjourned *sine die* until called together by the Committee to receive the report of the Committee."

Carried.

Votes of thanks to the Chairman and to the P. S. G. B. for use of room were proposed and carried unanimously.

## Societies' Meetings.

**NOTE.**—In this column the Editor can of necessity only give a brief summary of the proceedings. Papers read before societies will appear in the PHOTOGRAPHIC REPORTER, and the Editor of the REPORTER will be glad to receive reports for insertion as early as possible after the meetings have been held.

**Brixton and Clapham.**—The second annual meeting was held on the 19th inst., when a very satisfactory report and balance-sheet were presented. The officers for the ensuing year were elected as follows: President, A. R. Dresser, Esq.; Vice-President, J. Reynolds, Esq., M.D., F.R.G.S.; Committee, Messrs. T. J. Bartrop, W. Bevins, J. W. Coade, M. O. Forster, F. W. Maile, and F. W. Kent; Curator, Mr. W. H. Powell; Recorder, Mr. R. Kidson. The occasion was thought to be an appropriate one for presenting to the Secretary a whole-plate camera, etc., subscribed for by the members as a mark of their appreciation of his services. The next meeting will be held at Gresham Hall, Brixton, on April 9th, when Mr. Bevins will read a paper on "Light," with lantern experiments. Those desirous of joining should communicate with the Hon. Secretary, Fred. W. Levett, 126, Lowden Road, Herne Hill, S.E.

**Colchester.**—An instructive lecture on "Shooting Stars, Meteors, and Comets" was given on the 16th inst., at the Public Hall by the Rev. E. Ledger, Gresham Professor of Astronomy. The lecture was in connection with the Colchester Camera and Sketching Club, whose President, the Rev. C. L. Acland, occupied the chair. In the course of his address, the lecturer gave many interesting details regarding meteoric bodies, of which, he observed, about 700 fell on the earth's surface in the course of a year. With regard to shooting stars, he pointed out that twenty millions of these entered the earth's atmosphere every twenty-four hours. He also explained the effects produced by the dust of meteorites, and showed corpuscles of magnetic iron collected from the snow of Mont Blanc, and from the towers of Notre Dame, etc. Here and there, said the lecturer, swarms of meteorites were found side by side in parallel lines, and special swarms of these were met with on certain definite days. He described the "great November swarm" and the swarm of the 10th August, and remarked that the head or nucleus of a comet was believed to be really a group of meteorites moving together through space. He concluded by explaining the theories of astronomers as to the future of the solar system.

**Cornish.**—A meeting was held on the 13th inst. The "Seascape and River Scenery" Competition prints, lent by the Editor of the AMATEUR PHOTOGRAPHER, were on view, and were admired by a large audience, amongst whom were several well-known artists.

After inspecting the prints, a number of slides were thrown on the screen, which had been loaned from a contemporary.

**Croydon Micro.**—The 20th inst. was a lantern night, Mr. Edward Lovett (President) in the chair, when 200 slides were put through the lantern, the work of members, viz., Messrs. J. H. Baldock, A. H. Allen (some fine animal studies), Mr. Coldwells, J. A. Carter, Marriott, C. F. Oakley, W. Goode, A. W. Hurst, A. S. Wild, and W. Low-Sarjeant. Messrs. J. A. Carter and Marriott showed some fine slides of the recent severe snowfall, and Mr. Oakley also put on the screen, worthy of special notice, some photo-micrographs of rock-sections taken by polarised light. The next ordinary meeting will take place in the old School of Art room, on April 3rd, when Mr. A. R. Dresser has kindly undertaken to read a paper entitled "The After-Part of Hand Camera Negatives" (illustrated).

**Enfield.**—The ordinary meeting was held on the 18th inst., and in the absence, through illness, of Mr. R. B. Lodge, who was to have given a demonstration on platinotype, the gap was kindly filled by Dr. F. Cresswell, who showed the capabilities of the rival process of "Kallitype" to a large and appreciative number of members. The demonstration, which was a very exhaustive one, some dozens of prints being developed, was preceded by a full explanation of the principles on which Kallitype is based, and it was evident that the demonstrator not only had his subject thoroughly at his fingers' ends, but had been at considerable trouble in giving the club the benefit of his knowledge at a notice of only three days. Mr. Otto Scholzig sent samples of Dr. Jacoby's chloride of silver emulsion paper for distribution. Previous to Dr. Cresswell's demonstration, four new members were elected, and it was resolved that two delegates from the club should attend the adjourned meeting of the proposed federation on the 23rd inst.

**Harlesden and Willesden.**—At the last meeting of this Society on the 10th inst., the President (J. Naylor) gave a practical demonstration upon "Transparencies and Lantern Slide Making."

**Hastings.**—The March meeting took place on the 16th inst., at the Brassey Institute. Mr. H. F. Bultz, instead of giving his address on "Realistic Photography," as announced, changed the programme to a "Demonstration on Flash-light Photography," thinking the latter would be more interesting. He secured an excellent and fully-exposed negative of the Chairman (Mr. Newton Gardner) and the Hon. Secretary, developing the plate before the members. Mr. Weir Browne, a visitor from the Croydon Microscopical Society, described a process for obtaining warm tones on bromide prints and enlargements.
